An overhead crane delivers pig iron and scrap from railroad cars to the charging floor. The charging buckets are placed on an electrically driven scale-trolley, which is loaded by hand. Five of these trolleys run across the charging floor at right angles to the row of six cupolas, their tracks being slightly below the charging floor level. When a bucket is loaded the trolley moves it forward to a point midway between two cupolas. Here the bucket is on a level with a gravity conveyor that extends both ways in front of the cupola. Beneath the gravity conveyor there is an air hoist which pushes the buckets either to the left or right in front of a cupola door and at the same time places an empty bucket on the trolley. The loaded bucket is delivered in the cupola by an overhead crane.

Coke and limestone charges are handled on the opposite side of the cupolas. With the exception of the way these materials are charged in the cupolas, the method of handling coke and limestone is similar to that used in the foundry of the Buick Motor Co., described in THE IRON AGE of Nov. 27, 1927. Coke is dropped from railroad cars into a track hopper and carried up in a fully automatic skip, which delivers it into a cab-equipped larry car. This discharges the material into storage bin back of the cupola.

From the bin the coke is drawn out through double gates into the basket of a scale-equipped charging machine. This charger travels the full length of the floor back of the cupola and can be spotted in front of any cupola. The coke basket is run into the cupola, and the bottom of the basket pulled out under the load, giving an even distribution of the coke through the area of the cupola.

The mold conveyors, casting conveyors, sand-handling equipment, coke and limestone-handling equipment were built by the C. O. Bartlett & Snow Co., Cleveland. The Whiting Corporation supplied the cupolas and the material charging equipment. The tumbling mills were built by the W. W. Sly Co. The new core ovens were built by Holcroft & Co., and the core-sand mixing machines were supplied by the Standard Sand & Machine Co., Cleveland.

Creep of Low-Carbon Boiler Steels

CREEP experiments on 0.10 and 0.17 per cent steel have been made at the British National Physical Laboratory. In these tests nickel-plated tension pieces were loaded with a constant quiescent mass, and the amount of extension observed at intervals for several weeks.

Curves, where extension is plotted against time, are of two general types. In one, the extension rapidly subsides, and after a few days no further stretching occurs, or perhaps at a very small rate. These temperature and stress limits, below which a steel pressure vessel would be entirely stable (except for corrosion), are as follows:

0.17 Carbon Steel		0.10 Carbon Steel	
Temperature, Deg. C.	Stress, Lb. per Sq. In.	Temperature, Deg. C.	Stress, Lb. per Sq. In.
515	8,700	500	7,850
545	5,600	525	5,400
615	2,240	570	2,240

The initial stretching at loads at and below these limits apparently work hardens the metal, and raises the elastic limit above the limiting stress, whereupon the elongation stops. (When creep ceases, the material is elastic up to the applied stress.) However, when the work hardening is not sufficient to counterbalance the softening due to temperature, any initial creep would be continuous as long as the load is applied or until fracture results.

Light Alloys for Aircraft

Aluminum, Magnesium and Beryllium Are the Principal Metals—Research Constantly Discovering Desirable New Combinations

AIRCRAFT manufacturers have been making wonderful strides in building better and safer as well as larger airplanes and an important aid in this development work is being rendered by the manufacturers of the aluminum alloys used in airplane construction. That there is a constant striving for greater strength and lightness in metals used in airplane construction was brought out in papers presented at an aeronautical meeting held jointly by the Society of Automotive Engineers and the Aeronautical Chamber of Commerce of America at the Hotel Statler, in Cleveland, last week in connection with the annual air races.

Several technical sessions were held, the one Wednesday being devoted to light alloys. This was presided over by Carl B. Fritsche, president of the Aircraft Development Corporation, Detroit, which recently completed the all-metal dirigible ZMC-2 for the Navy Department, described in THE IRON AGE, Aug. 22. Mr. Fritsche remarked at the opening of the meeting that there is a definite trend toward all-metal construction in the aircraft industry.

Wide Variety of Aluminum Alloys Used

ALUMINUM and magnesium, being the lightest commercial metals, are the most suitable for use in aircraft construction, declared E. H. Dix, Jr., metallurgist, Aluminum Co. of America, New Kensington, Pa. Unalloyed, these metals are soft and weak, so that their application is limited. Sheets of 99 per cent aluminum can be hardened by cold working so that they are strong enough for cowling and gasoline tanks. The addition of 1¼ per cent of manganese increases the strength and hardness of this alloy. In sheet form it is now used extensively for cooking utensils, and should, because of its corrosive resistance, sooner or later find useful application in the aircraft industry.

Heat treated aluminum alloys are of the greatest importance to aircraft construction, as they possess mechanical properties comparable with those of structural steel. However, because the modulus of elasticity of aluminum and its alloys is practically one-third that of steel, it is necessary to use somewhat thicker sections than would be dictated if relative tensile strengths alone were considered. For this reason aluminum sections are usually about one-half the weight of steel.

Most aluminum castings produced in this country have copper as the principal alloying constituent, and aluminum-copper alloys containing 4 per cent of copper form the base of the most important heat treatable alloys. Duralumin contains 3½ to 4 per cent copper and ½ per cent each of manganese and magnesium. Silicon is used extensively as an alloying element for casting alloys. Nickel is being used to an increasing extent in metal for pistons and cylinder heads. Physical properties of these alloys are given in the table.

Magnesium Alloy Castings Are Heat Treated

IN the magnesium base alloys, aluminum and manganese are the most important alloying elements. Aluminum is used up to 12 per cent and produces alloys that are susceptible to heat treatment. One of the most useful magnesium alloys contains 7 per cent of aluminum and 0.4 per cent of manganese. As sand cast and heat treated this alloy shows a tensile strength of 29,000 to 38,000 lb. per sq. in. and an elongation of 10 to 6 per cent. It is used for starter and pump housings, gearcases and covers, motor cover plates, intake manifolds and sections of crankcases. These parts usually are heat treated if additional strength is required. For rolled sheet, plate, or bar, pure magnesium or an alloy containing 4 per cent of aluminum and 0.4 per cent of manganese is used. The magnesium alloys mentioned, as now made, are stable under atmos-

[d] Quenched.
[e] Quenched and artificially aged.
[f] A indicates highest corrosion resistance.
[g] Refers to castings only; properties vary with heat-treatment.

pheric conditions and no defects from corrosion have been reported.

Mr. Dix discussed at some length the corrosion of aluminum alloys, which the author said has been a greatly overemphasized subject. He pointed out that corrosion is always an important problem in the aircraft industry, because, owing to the lightness of planes, a slight deterioration by corrosion might result in structural failures. Because of the greatly accelerated conditions under which laboratory tests are made it is dangerous to interpret these tests in the terms of service conditions. In the method now generally used standard tensile specimens are exposed to a corrosive condition and a tensile test is made on these samples after different periods of exposure. The tensile strength and elongation thus observed are compared with the same properties obtained from similar samples that have not been subjected to corrosive influences.

Three Types of Corrosion

THE speaker pointed out that corrosion of metals may occur in general in three ways. There may be a uniform solution of the surface, which moderately decreases the tensile strength. This type of corrosion need not be greatly feared, as its extent can be determined by visual inspection. The pitting type of corrosion is more serious, as this causes a decrease in the ductility as well as in the tensile strength. The third type, inter-granular corrosion, proceeds along grain boundaries and therefore considerable corrosion may occur, although only a small amount of it may be visible. This corrosion causes a decrease in tensile strength with a marked reduction in elongation.

Artificial aging of certain of the heat treatable aluminum alloys at an elevated temperature to produce maximum strength in hardness causes a marked decrease in corrosion resistance. For this reason the artificial aging of thin sheets of alloys for aircraft construction is not recommended.

The speaker discussed some of the qualities of Alclad, which is a corrosion resistant aluminum sheet. This is produced by covering the strong aluminum alloy core with thin layers of extremely pure aluminum. The high purity aluminum on the surface not only protects the alloy from corrosion by acting as a covering, but also exerts an electrolytic protection over any exposed areas of the underlying alloy, as at the sheared edges of the sheet or in abraded areas.

Methods of painting aluminum alloys as a protection against corrosion have been developed which are proving very satisfactory in commercial use. While sand blasting and other methods of cleaning before painting have been used, Mr. Dix stated it is now generally believed that cleaning with certain mild chemical cleaners which remove the grease without attacking the metal is the most satisfactory method.

During a discussion of the paper, Mr. Dix expressed the opinion that the electric furnace will ultimately be used for heat treating some of the strong aluminum alloys that are now usually heat treated in a bath of fused sodium nitrate, because of the necessity of having close temperature control.

Forging Alloys of Aluminum

MODERN light alloys and their application to aircraft engine design were discussed in a paper by G. D. Welty, engineer, Aluminum Co. of America, Cleveland. He pointed out that there are properties in metal for some uses that exceed in importance the properties of strength and lightness. One of these is the property of thermal conductivity.

There are three strong wrought alloys in common use in the aircraft industry today. One known as 17-S is used mostly in the form of sheet, tubing and extruded shapes for such parts as frame work and wing coverings. For the latter purpose the sheet is usually given a coating of high purity aluminum (Alclad).

The two other commonly used alloys, 25-S and 51-S (Table I), are better suited for making forgings, and are used extensively in aircraft engines. 25-S, heat treated and aged, has high tensile strength and a Brinell hardness of 110. This combination of properties makes it suitable for use in highly stressed parts such as propeller blades, connecting rods for in-line engines and link rods for radial engines. This alloy can also be used as a bearing material running directly against the journal.

Alloy 51-S, heat treated and aged, is lower in ultimate strength than 25-S, but is practically its equivalent in yield point and hardness. Forgings can be made from this alloy which would be difficult, if not impossible, to make from the harder alloys. Mr. Welty said that it is widely used for such parts as crankcases and nose sections for radial engines.

Selecting the Proper Alloy Casting

IT was pointed out that selecting the most suitable alloys for aircraft engine castings often presents a more complicated problem than in the case of forgings, because such questions as production in permanent molds, strength at high temperatures, bearing characteristics, thermal conductivity and cost are frequently important factors. The old reliable alloy, No. 12 (containing 8 per cent copper and the balance commercially pure virgin aluminum), is used in large quantities by the automotive industry for engines up to 400 hp. of the in-line or the V type. However, in radial engines and in large V-type engines, where efforts are being made to reduce weight, the modern heat treated casting alloys of aluminum or magnesium have displaced No. 12 for major parts. Mr. Welty made a comparison of properties of the two alloys to emphasize the advance that has been made through the development of heat treated compositions. The tensile strength of sand cast alloy No. 195 is about 50 per cent more than No. 12, and the elongation is more than four times as much. A ½-in. sand-cast test specimen of No. 195 can be bent through an angle of more than 90 deg. before fracture occurs. This was unheard of in cast alloys a few years ago. He also referred to the lower density of the No. 195 alloy, which is of importance because of the saving in weight.

Tough Alloys Cut with Tungsten Carbide Tools

THE author mentioned an aluminum piston alloy developed during the past few years, which he said is beginning to have commercial application. The advantages of this piston alloy consist chiefly in a lower coefficient of expansion and the lower specific gravity. This alloy, he said, is difficult to cut, but with the cemented tungsten carbide tools now available it can be readily machined.

Discussing the place of magnesium in the aircraft industry, the author recommended careful tests before adopting magnesium alloys for major structural castings. Through long intensive research work, magnesium products can now be made that are harder and far more resistant to corrosion than formerly produced. As a result the magnesium industry is now emerging from an experimental stage to a sound commercial basis.

Possibilities of the Light Metal Beryllium

THE new metal beryllium was discussed by C. B. Sawyer, Brush Laboratories, Cleveland. This metallic element somewhat resembles both magnesium and aluminum. Its density is about the same as magnesium and its strength is high, being comparable to that of steel and its modulus of elasticity is about the same as steel. Its coefficient of thermal expansion and its melting point are

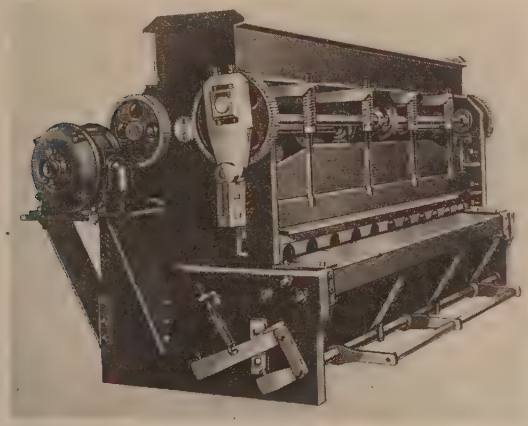
(*Concluded on page* 646)

Welded-Steel Overhead Drive Gap-Type Shear

AN overhead drive gap-type squaring shear having a non-deflecting welded plate steel frame has been added to the line of the Dreis & Krump Mfg. Co., 7430 Loomis Street, Chicago.

Timken roller bearings are provided on the flywheel shaft and the "super" hold-down employed is intended to provide uniform pressure on the metal before and during the cutting operation. Lubrication is centralized and, as in the company's underdrive weld-steel squaring shears, sheet steel guards are provided at both ends as well as front and rear.

A feature is the simple adjustment in the connecting bars for raising and lowering the upper knife bar. This adjustment is necessary in changing from shearing sheets requiring only one stroke of the upper knife bar to the shearing of sheets requiring more than one stroke, and vice versa. It is stated that in shearing a sheet requiring just one stroke, the blades should pass one another at the finishing point, while in shearing a sheet requiring more than one stroke, the blades should meet within the thickness of the material being sheared at the finishing point. Adjustment is quickly made by turning the adjusting screws in the connecting bars up or down, as required. Standard gaps are 18 and 24 in., but special gaps can be furnished.



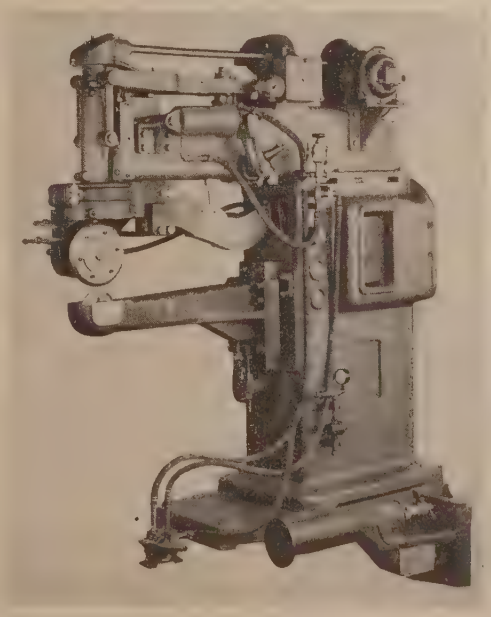
THE Gap Shear Has Direct - Connected Motor Drive and Easily Adjustable Connecting Bar

Heavy-Duty Double-Roller Seam Welder

A HEAVY-DUTY double-roller 30-in. throat seam welder incorporating improved methods of mounting and cooling of upper and lower roller electrode is illustrated herewith.

Drive of the upper roller electrode is through motor, speed - reduction unit and gearing, including change gears for altering the speed of the upper roller. Pressure on the work or the electrodes is obtained by means of an air cylinder that operates through an adjustable spring. Turning on and off of the welding current is controlled automatically through pressure cylinder. The initial air-line pressure to the cylinder may be varied through an adjustable relief valve, the pressure cylinder being controlled by means of a foot valve. The upper roller, which is of offset or open-side type, can be quickly replaced. The roller is a copper forging and is mounted on the large hub of shaft which is made of durable material. This shaft, as well as the bearing housing, is water cooled, and the construction of the bearing housing and its mounting is such that they may be rotated through 90 degrees without disconnecting or breaking any electrical joint. The same simplicity of roller mounting is used on the lower horn, and this horn, as well as the roller shaft, is water cooled.

The machine is designed for use on either cylindrical steel or iron, up to No. 14 gage. It is built by the Thomson Electric Welding Co., Lynn, Mass., and can be furnished with a transformer rated at 100, 150 or 175 kva.



Automatic Device for Arc Welding Operations

AN improved automatic welding outfit known as the Weldomatic is a recent development of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. It is designed to operate from either variable or constant-voltage welding motor-generator sets and to meet a demand for an automatic welder of compact dimensions to facilitate mounting on the welding tools, as well as a device that is as reliable as the usual shop tool. It automatically strikes and holds an arc between an electrode and the work to be welded without the aid of an operator, except for pressing the starting button.

The Weldomatic Strikes the Arc Between Electrode and the Work Without the Aid of an Operator

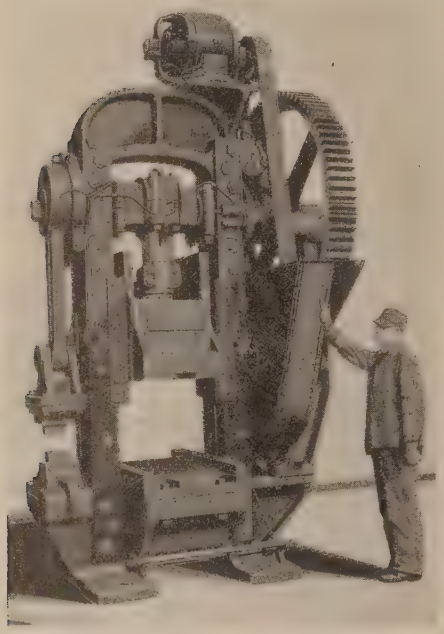
The feeding device permits its ready application to work handling tools. The drive motor is mounted in a cylindrical frame which supports the nozzle assembly. The nozzle has adjustments for being moved in two planes, and the assembly can be easily changed for either right hand or left hand work.

For the tractor plant to be built for the Soviet Government at Stalingrad, Albert Kahn, Detroit, is architect and the Truscon Steel Co., Youngstown, Ohio, will supply the building materials.

Press With Forged Steel Side Frames

A NEW straight-sided trimming press featuring forged steel side frames and friction slip flywheel has been brought out by Chambersburg Engineering Co., Chambersburg, Pa.

The forged steel side frames minimize breakage and the friction slip flywheel is intended to guard against overloading, stalling and breaking. Adjustment of the frictions is rarely necessary after slipping, and therefore lost time from this cause is practically eliminated. Before shipment each press is given an "overload-stall" test. Each machine must retain proper alinement when the ram is stalled at full speed near the bottom of its stroke, and must function satisfactorily after the test without adjustment. All shafts are on one side of the press and the driveshaft is mounted in roller bearings. The machine is furnished with or without the sprue cutter.

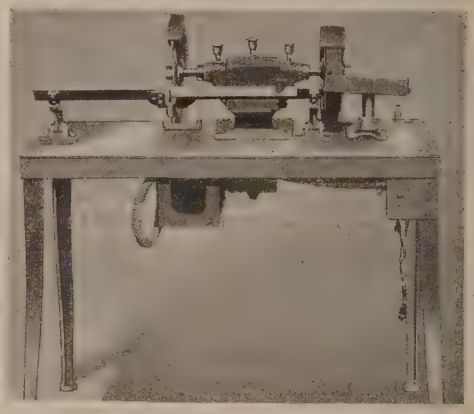


(Left) The Forged-Steel Side Frames Minimize Breakage and the Friction Slip Flywheel Guards Against Overloading

New Core Making Equipment

A CORE cutting-off and coning machine and a new core making machine, both motor driven, have been placed on the market by the Wadsworth Core Machine & Equipment Co., Akron, Ohio.

The cutting-off and coning machine, illustrated herewith, is of ⅜ in. to 2¼-in. capacity and is driven by a ¼-hp., 110-volt, alternating current motor that takes current from a light or power circuit. The motor is controlled by a push-button switch located at the operator's right hand. All working parts of the machine, including the cutting-off and coning wheels, are completely guarded. The swinging rest for holding the core while being cut off has a graduated scale and a movable stop that can be adjusted to give various lengths of cores, and an adjustable core rest for the coning wheel permits the operator to make any desired taper or cone on the end of the core.



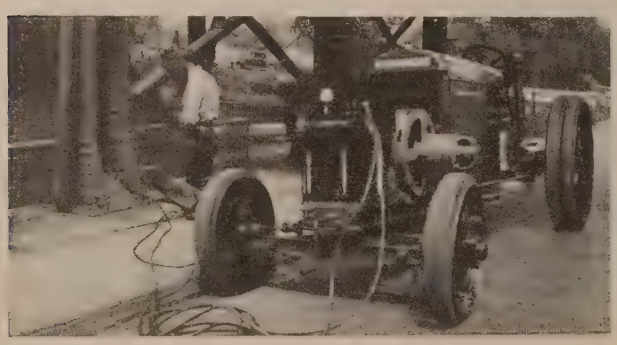
(Right) Core Cutting-Off and Coning Machine Equipped with Motor Drive to Increase Output

Designated as the No. 1 and similar to the previous model, the new motor-driven core making machine uses the same dies, conveyor screws and other accessories of the former machine. The capacity is from ⅜ in. to 3 in. It is driven by a ½-hp. 110-220 volt direct connected motor that takes current from the lighting circuit, and is equipped with a simple safety clutch that is intended to protect both the gears and the motor. The machine is stopped and started by means of push-button switch. All parts of the machine are accessible and ample lubrication is provided. The motor-driven machine provides for higher output than the hand-operated unit.

Tractor-Mounted Arc Welder

AN arc welding unit consisting of a Lincoln stable arc welder mounted on a McCormick-Deering tractor is being built by the Pontiac Tractor Co., Pontiac, Mich. It is furnished either with a 200 or a 300-ampere machine, and is intended for utility work of wide range.

The extension frame in this mounting is such that the tractor is simply set into a 4 in. I-beam frame and the front axle assembly is set ahead under the frame, thereby lengthening the wheelbase. This construction is intended to reinforce the tractor and give it balance, making it easy to steer with the added weight. The welder unit complete with the panel is mounted on this frame member ahead of the tractor and is driven by belt from the power pulley at the side of the tractor. Dual 48 x 4-in. tires are used in the rear. The road speed of the machine is 15 miles an hour.



With a Road Speed of 15 Miles an Hour, the Tractor-Mounted Welder Is Adapted for Utility Work of Wide Range

Wire enameling machines formerly built by the Strand Enamel Works, Winsted, Conn., will be manufactured and marketed exclusively by Sleeper & Hartley, Inc., Worcester, Mass. The Strand company will continue the manufacture and sale of enameling materials.

Midwest Air Filters, Inc., Bradford, Pa., has moved its New York district sales office from East Forty-fifth Street to 347 Madison Avenue.

This Issue in Brief

Riveted test boiler drum of manganese steel fails in head in fatigue tests. After 45,000 cycles of pressure at 50 per cent above working stress, slight leaks appear in head seams.—Page 610.

* * *

Disassembles airplane engines after 5-hr. test run. Parts are then washed and inspected, engine is reassembled and given final test.—Page 597.

* * *

Congestion due to conveyor tie-ups or "slow-downs" is avoided by use of trucks and trailers, which take some of the material off the mechanical conveyors and deliver it to its destination.—Page 594.

* * *

Automobile plant maintains a separate conveying department with a central office. The routing man enters on a special chart all calls for special movements of materials, turning the calls over to operators whose schedules are light at the moment.—Page 594.

* * *

Steel is not attacked if pickling is done properly, tests reveal. When steel rods are cleaned in dilute acid, the oxide scale first succumbs; after the metal is laid bare the steel begins to corrode. —Page 598.

* * *

Fatigue of steel caused airplane disaster. Examination of fractured bearing stud in engine of destroyed British plane reveals no heat discoloration.—Page 600.

* * *

Strength of welded boiler seams under repeated cycles of pressure is greatly affected by variations in welding practice, tests reveal. Necessity for developing good, uniform welding practice, plus careful inspection, is indicated, says engineer.—Page 611.

Welded joints in test drum shells have been developed which withstood cycles of stress varying from zero to a value 50 per cent above the allowable working stress for more than 400,000 cycles. This is at least 50 times as many cycles as would be developed in the normal life of a boiler.—Page 611.

* * *

Pitting type of corrosion is more to be feared than surface corrosion, for the former causes a decrease in ductility as well as in tensile strength of aluminum alloys. The third type, intergranular corrosion, proceeds along grain boundaries, and, although only a small amount may be visible, considerable corrosion may occur.—Page 616.

* * *

New August pig iron production record established with average daily output of 121,151 tons, which was ¾ per cent below July daily rate. On Sept. 1 there were 210 furnaces in blast, a net loss of 6 for the month.—Page 624.

* * *

Saves 60 per cent of cost of handling refuse materials. Purchase of gasoline tractor, side-dump wagons and chutes more than halves the expense of waste removal, compared with cost of having work done by an outside hauling company.—Page 594.

* * *

Stamping department costs sharply cut by using electric lift trucks for changing heavy dies. Labor expense of eight men is saved.—Page 596.

* * *

Artificial aging of aluminum alloy sheets for aircraft construction is not recommended. Though maximum strength and hardness are attained, corrosion resistance is reduced.—Page 616.

Reduces forging plant costs by using power loader to dump small forgings into cleaning barrels. Loaded skid is placed on loader by a truck and the skid and its contents are raised and dumped directly into tumbling barrel.—Page 601.

* * *

Breaks in drawing dies will result from ineffectiveness of the lubricant if occluded hydrogen is left in the stock after the pickling operation. Rough, embrittled surfaces offer ample secretion for the hydrogen.—Page 598.

* * *

Tapped hole in boiler shell under pressure fatigue test proves weaker than welds. Tests suggest incorrectness of theory that a hole causes a stress-intensification at its edge amounting to three times the computed stress in the plate.—Page 609.

* * *

Scrap-conveying belt carries forging flashings from trimming presses direct to dump-body skid. Skid is then emptied into a baling press.—Page 601.

* * *

Pickling costs can be cut if solution is properly inhibited. Proper use of inhibitors prevents production of harmful hydrogen, and water only is formed.—Page 598.

* * *

Foundry solves problem of smoke and heat in the vicinity of shake-out by performing this operation below the floor. Castings and sand are knocked out through a grating on to an apron conveyor. Gases and smoke are drawn away through a hood above the shake-out.—Page 613.

ESTABLISHED 1855

Our Machine Tool Prosperity

AS with steel, the demand for machine tools this year has far outstripped all expectations. The traditional summer slump has not come. In June the National Machine Tool Builders' Association observed that "activity is not likely to continue at the present level"; yet in spite of the absence of many purchasing executives on vacations and the letdown in the automobile industry, July and August brought only a moderate recession in machine tool buying. Many companies have unfilled orders on their books in substantially as large a volume as at the beginning of the summer. Some lines are so well sold up that the best possible deliveries now offered extend into the first quarter of 1930.

Such a situation the machine tool industry has not known since the war. Even during the exceptionally prosperous 1919-1920 period the manufacturers were constantly menaced by the thousands of used tools still in process of liquidation after the war.

Present conditions bear no resemblance to a boom. There has been no enormous expansion of metal-working plants, such as occurred during the war, to account for a demand in excess of output. Some large lots of tools have been bought, but in the main the industry has received the bulk of its orders in units of one to half a dozen machines from widely diversified lines of manufacture.

Progress in design has brought into use tools which in output and reduction of operator attendance have so far surpassed those of ten years ago that manufacturers who would keep their costs on a level with their competitors' have been forced to adopt the newer equipment.

Companies which install machines of greater productive efficiency are not always able to keep their competitors from knowing the cost reductions achieved. Competition is such today that the improved process of one manufacturer soon becomes the practice of the more progressive of his rivals.

Machine tool builders who are trying to scan the future believe that another era of rehabilitation of machine tool equipment in American manufacturing plants is really just beginning. Perhaps no single current development is of more widespread interest than the experiments with tungsten carbide cutting tools, with their promise of the extension of machine shop work into hitherto unoccupied fields.

Apparently most users of machine tools are not waiting for the full fruition of prospective machine tool changes, but are availing themselves of the best of current models, so that no time may be lost in putting their shop costs on the lowest possible basis. Only a minimum of postponed buying has resulted from the fact that in another month an unusual array of the products of machine tool design, including many tools not shown before, will be seen at the National Machine Tool Exposition in Cleveland.

Scrap Supply Has Not Failed

IN 1906, when Bessemer steel output was at its maximum and the steel ingot figures showed 54½ per cent Bessemer and 45½ per cent open-hearth, no one would have believed that if in 1929 we were to make 87½ per cent open-hearth and only 12½ per cent Bessemer there would be enough scrap to go around. The prediction would have been made with confidence that a much larger percentage of pig iron and a much smaller percentage of scrap would have to be used, the point being that substantially all the scrap made in rolling Bessemer steel is available for open-hearth use.

Yet the fact is that in 1906 the total production of basic pig iron was 52 per cent of the total production of basic open-hearth steel ingots and castings, while in the first half of this year the proportion was approximately 53½ per cent, showing an almost negligible rise of 1½ points.

Various influences have been at work to offset and preserve a good supply of scrap for open-hearth steel making. First, the proportion of works scrap to ingot production has increased. In 1906 rolled steel production was 76.9 per cent of ingot production, while in 1928 the proportion was down to 73.9 per cent. Second, 2,186,557 tons of rolled iron was produced in 1906, chiefly from scrap, but in 1928 only 484,977 tons. There was not merely a failure to keep pace with the general increase in scrap supply, but the actual release of more than a million tons of scrap. Third, the foundry industry has failed to keep pace, if, indeed, it has not decreased its scrap consumption. Fourth, in the consumption or working up of steel there is a larger percentage of scrap produced, due in chief to the more intricate operations performed. The automobile industry is a very large producer of scrap relative to its steel purchases.

The four trends mentioned are readily observed. Two additional trends will be admitted, although

they cannot be measured. In the first place, the layer of steel spread over the country has become denser or thicker, and thus it is easier than formerly to gather old material. Possibly there is a partial offset to this in the smallness to which we now reduce some steel, to the tin can, for instance. Second, things move faster nowadays and in many cases scrap comes back sooner. The increase in weight of railroad rolling stock and the advent of the automobile have necessitated greater replacement of bridges than in the old days. Buildings now being torn down contain much more steel than those torn down in 1906.

The future is another matter. Several of the trends mentioned will not continue to help the scrap supply. Pig iron may come into its own. Production of sound ingots at a cost competitive with the convenient method of cropping to get sound steel would make a great difference.

Building Up Industry in Russia

OFFICIAL reports and statements of unofficial observers unite in declaring that the manufacturing industries in Russia are generally producing at a higher rate than prior to 1914. Russia always has been a nation of peasant farmers, and even yet the per capita consumption of such things as electricity, sewing machines and even agricultural machinery is very low.

As is well known, during the revolution production was almost at a standstill. After some disastrous experiments in over-centralization, the Soviet Government has reverted lately to a workable economic policy in the form of various industrial trusts, each responsible for the small details of production, and subject to control of the state only on such questions as policy, labor management and volume of production. New projects are being financed by the central government as rapidly as the balance of trade and foreign credit permits. Apportionment of funds is made according to a five-year budget which contemplates, among other things, the trebling of pig iron production and doubling the output of rolled steel by 1933.

One traveler, who has written for the *Iron and Steel Industry* (London), was particularly struck with the Leningrad Metal Factory, typical of the new plants being erected. "Imagine, if you can," he writes, "a boiler factory built by a philanthropic millionaire, solely with a view to the health, comfort and cleanliness of the workers. A place of light and spaciousness. Windows, beautifully designed, occupied almost the entire breadth and depth of the two ends of the first shop one entered. They are wide and lofty like the windows of a cathedral. The gangways are wide. Floorings are clean and smooth. Machinery was active and efficient. There was no sign of idleness or indiscipline."

The British observer was of the opinion that overhead charges were entirely disregarded in this plant. That does not exactly follow. While we in America have not yet reached the plane of putting cathedral windows into boiler shops, we have discovered that a wall made of glass is quite frequently cheaper than a wall of brick when everything is taken into consideration. In other words, American industry has long recognized that what might appear to be wasteful expenditures for the employees—like physical examinations, medical dispensary service and care of health, sanitary latrines and drinking fountains, rest periods, special light and even artificial weather, spacious working places, parked grounds, clean, well painted shops, elimination of noise, heat, smoke and dust—all these things make for better efficiency in the workman, lower labor turnover and a lowered manufacturing cost for a superior article.

A modern Russian factory is not to be criticized, therefore, for its spaciousness, cleanliness and ornamentation. The Soviets are getting the best kind of tools, but unfortunately, do not know yet how to use them. The result is that a Diesel engine which could be bought in Germany for $2,000 costs them $3,500 to build at home, even though the Soviet Government has built the factory (and capital costs are zero), though the industrial trusts have a monopoly (and selling costs are at a minimum) and though the state theoretically regulates the cost of living and the labor cost.

Research and Human Satisfactions

"WERE it not for the very great improvements in electric power and electric lighting which have been made by the industrial scientists during the past 25 years," writes John J. Carty, vice-president American Telephone & Telegraph Co., "the bill which the public is now paying for electric current would be greater by more than two billion dollars a year."

Without wishing to dispute the argument about the value of industrial research, we think that General Carty reaches his objective from the wrong direction. If these many improvements had not been made, the public would not be using nearly so much power as it does today. The advantage of research is not primarily that profits are enlarged, or that selling prices are reduced; it is that the utility is increased. More and more electricity is used by more and more people, with a tremendous increase in human satisfactions.

That is the achievement of research in all the industries.

Steel Extras Holding

BETTER merchandising methods in steel came strongly to the front in trade discussions late in 1927. Lately the matter has had little prominence, as heavy demand has made the flow of orders quite smooth. There is one phase of this general subject that deserves attention now as much as at any other time, for it encourages effort to make further improvement, and that is the matter of extras, differentials, etc. What steel sellers have done in the last few years by way of revising their lists and rules, and of adhering to them, is remarkable when we think of the violations in earlier years and the indisposition of sellers

to make changes when such changes were clearly dictated by considerations of cost and other factors.

In the last three years there have been many changes and improvements of this sort, more than anyone is likely to recall off-hand. In not a few cases there was opposition as well as a doubt whether sellers would really adhere to the new rules laid down, but in every instance so far as known the new practices came into vogue with little difficulty.

No doubt there has been a gradual change in the mental attitude of buyers which helped to put these reforms into effect. Cost accounting has been vastly improved and the average buyer, when the mill tells him it costs so much to fill this or that specification, realizes that the mill knows what it is talking about; that there is no effort to squeeze out an extra profit on the particular sizes or forms of material involved. The steel consumer has his own experiences in cost accounting and is ready to admit that the steel producer is in the same position.

Just three years ago the sheet steel industry made a sweeping change in its gage differentials on black and galvanized sheets. For many years 28 gage had been base, and costs had become such that the established differentials were not in keeping. The differential, for instance, between 28 gage and 24 gage was less than the difference in cost, and accordingly there was shading of the 28 gage base price when the specification involved 24 gage. The change consisted in making 24 gage the base, instead of 28, and gage differentials were revised so as to give a wider spread between 24 and 28, in keeping with costs. Some buyers had doubts whether mills would promptly and fully adhere to the new system, but there was no trouble. Later the sheet mills reduced the cash discount from 2 per cent to ½ per cent and there was much complaint, chiefly by jobbers, but the change was made.

There was a card on wire nails which was not in keeping with latter day costs. As of Dec. 1, 1927, the nail manufacturers adopted a new card in line with the conditions. There was criticism and a little doubt whether the new card would be followed, but the whole matter has passed into history.

Various other revisions could be listed. It is sufficient to point out that in the last few years steel makers have been able to put their prices into closer alinement with costs and to effect these reforms with an acquiescence on the part of buyers which would not have been expected in the old days. This encourages the making of such further changes as may be suggested by costs and sales conditions.

Pure Iron

A RECENT technical paper by T. D. Yensen of the research department of the Westinghouse Electric & Manufacturing Co. draws our attention to the fact that at present science and technology know no such thing as pure iron. Purity is, of course, an indefinite term in respect to anything short of the absolute and may always remain so. However, we gradually increase in refinement. We used to speak of substances as being pure when perhaps they were rather far from being so. A distinction might then be made as to the same substance produced in small quantity for laboratory use by characterizing it as "chemically pure," and the conventional abbreviation c.p. still remains a part of our technical vernacular. Some commodities now regularly produced are superior in refinement to the old c.p. grades. In small quantities the ability of ordinary, or even extraordinary, chemical analysis is surpassed and we have to coin a new phraseology and speak of a substance as being spectroscopically pure.

According to Mr. Yensen, the highest grade of iron that has been commercially available is one guaranteed to contain 99.85 per cent Fe. That is considerably short of the grade of first-class commercial copper, lead and zinc. What is called "high-grade" zinc is available in great tonnage with 99.93 to 99.97 per cent Zn. A super-zinc is produced in large tonnage with 99.99 per cent Zn. From the research laboratories come samples of spectroscopically pure metal with 99.9999 per cent Zn.

In its work on iron the Westinghouse laboratory during the past 10 or 15 years has been able to produce metal containing 99.95 per cent Fe. We infer that recently it has been possible to go even higher than that. As has been the experience with other metals, the removal of impurities in terms of the last few hundredths of 1 per cent shows enormous changes in some of the properties of the metal. The most striking things so far observed as regards iron are immense increases in magnetic permeability and much lower hysteresis values. There are indications that pure iron may have a hysteresis loss approaching zero. These are important things for electrical manufacturing.

Of course there are many uses for which pure iron is not wanted. Manifestly steel owes its valuable properties to other elements that are combined with iron. So it is with zinc. Super-zinc finds special uses; but on the other hand some manufacturing is best done with spelter containing a little cadmium, or a little lead, or a little of both. Alloying elements that develop valuable properties obviously are not to be regarded as impurities.

One of the startling things of modern metallurgy has been the powerful effect of the addition (or subtraction) of minute quantities of other metals to an iron, copper, lead or zinc base. And one of the practical developments therefrom has been the increased buying by manufacturers according to specifications. We have traveled a long way from the abracadabric days when in deference to the ideas of a Welsh foreman metal could be used successfully only if it were cast in a mold with a certain brand; and when smelters kept an assortment of molds with different brands to satisfy the requirements of different Welsh foremen.

A Diesel engined tractor, exhibited at a recent agricultural exhibition in England, has a variable gear in its transmission, so arranged that the speed reduction is automatically adjusted by an infinite number of steps to correspond with the tractive effort at the draw bar, required to pull the load. The engine exhibited had run 100,000 miles without repairs to the transmission.

Appeals for Support of Reserve Board

System to Be Sharply Contested Issue in Congress, Says Alvan T. Simonds—Results Will Be Far-Reaching

"AS we look ahead at industrial and business conditions, perhaps the most important question is whether or not the Federal Reserve Board will be able to control the use of credit and keep at a reasonable point the cost of borrowing money for use in commerce and industry," says Alvan T. Simonds, president, Simonds Saw & Steel Co., Fitchburg, Mass., in the September issue of *Looking Ahead.*

"The Reserve System, when it was adopted, was expected to do this. It was also expected to eliminate bank failures among its member banks. It was also hoped that few banks would find it profitable to remain outside the system. The root of the plan was protection for all who entrusted their money to the banks."

Mr. Simonds says that it is a common duty to support the Government as represented by the Federal Reserve Board. In Great Britain, he declared, the Bank of England is regarded as a part of the nation's defense and Chancellor of the Exchequer Snowden recently called upon other financial institutions, in no uncertain terms, to lend their support to the bank. He asked more of them than the Federal Reserve Board would think of asking for in America.

Referring to current agitation aimed at the Reserve System, Mr. Simonds added, "We shall do well to watch and study the situation as it develops, for it promises to bring before Congress and the country one of the most perplexing and most sharply contested post-war financial issues. Upon the settlement of this issue may depend industrial, commercial and financial prosperity in the United States for years to come. A new patriotism, perhaps a higher patriotism, is called for, especially on the part of some of those of great financial influence."

Commenting on the current stage of production in this country, Mr. Simonds points out that since 1919 there have been three complete cycles in industrial output in terms of volume (not dollars), as reported by the Federal Reserve *Bulletin.* Each peak has been higher than the preceding one and each has come later in the year than in the preceding cycle. The fourth cycle, now in progress, has thus far been in the ascending stage and it is still uncertain whether, following precedent, the peak will be later than it was in 1926, in the previous cycle. Industrial production, as reported monthly in the Federal Reserve *Bulletin,* does not include output of agriculture or fisheries.

Foundry Equipment Makers Consider Exports

The continuance of excellent business conditions in the foundry machinery field for the remainder of this year was predicted at the forty-eighth meeting of the Foundry Equipment Manufacturers Association held at the Hotel Van Curler, Schenectady, N. Y., Aug. 29 and 30. It was pointed out that the index of gross orders for foundry equipment for the month of July, 219.3, was the highest since August, 1928.

Reports were presented at the meeting by S. T. Johnston, S. Obermayer Co., Chicago, M. J. Evans, Whiting Corporation, Harvey, Ill., and H. Cole Estep, secretary-treasurer of the association, covering opportunities in Europe for the promotion of export trade in American foundry equipment, based on observations at the recent International Foundrymen's Congress in London.

E. O. Shreve, head of the Industrial Division of the General Electric Co. and J. P. Jones, manager of machinery sales of the General Electric Co., entertained the visiting delegates during the meeting. An inspection tour of the General Electric Research Laboratories took place Friday morning followed by luncheon at the General Electric Works, at which Mr. Shreve discussed the sales problems of machinery manufacturers.

At the Association's luncheon Thursday, Aug. 29, Dr. A. W. Hull, assistant director of research, General Electric Co., outlined some of the research problems now confronting the General Electric organization, with special reference to the application of vacuum tubes to the control of power circuits.

The members of the association presented past president S. C. Vessy, W. W. Sly Mfg. Co., Cleveland, a golf bag in recognition of his services to the organization. An enjoyable tournament was held at the Mohawk Golf Club.

The next meeting will be held in New York, Nov. 19.

Federal Reserve Is Subject of Simonds Contest

"The Federal Reserve System and the Control of Credit" is the subject of the Alvan T. Simonds economic contest for 1929. Papers must be submitted by Dec. 31, 1929. Rules may be obtained by writing the contest editor, Simonds Saw & Steel Co., Fitchburg, Mass.

Robert F. Elder, Berlin, N. H., the winner of the first prize of $1,000 in the Simonds economic contest for 1928 on the subject, "Reducing the Costs of Distribution," has been appointed instructor in marketing at the Massachusetts Institute of Technology. According to the authorities of that school, "Mr. Elder came to our attention as the result of his prize-winning essay. We probably never would have known of his talents had it not been for the prize offered by Mr. Simonds."

Connersville and Wilbraham Blower Companies Bought

The Stacey Engineering Co., a new Ohio corporation operating as a holding company, took over the following manufacturing concerns on Aug. 31:

Stacey Brothers Gas Construction Co., Cincinnati, Connersville Blower Co., Connersville, Ind., and Wilbraham-Green Blower Co., Pottstown, Pa.

These companies for a long period of years have been engaged in the construction of gas holders, blowers and other apparatus. The new concern has also a substantial interest in other allied concerns.

The new company is headed by Beman G. Dawes, chairman of the board, Pure Oil Co., and with him are associated Carmi A. Thompson, Cleveland, and F. S. Heath, Columbus. The board of directors includes Wayne Stacey, William A. Miller, John T. Wilkin and Charles A. Ward. Carmi A. Thompson is president, John T. Wilkin, F. S. Heath and Wayne Stacey, vice-presidents; D. H. Mulloney, secretary; Charles A. Ward, treasurer.

The Stacey Brothers company has made a specialty of low-pressure telescopic gas holders. The Connersville company started in a small way in 1893 and manufactures more than 100 different types of blowers, and in addition controls patents on a new type of station meter. The Wilbraham-Green company is one of the oldest companies of its kind in existence.

All three of these companies will be officered by their present organizations. The home offices of the Stacey Engineering Co. for the present will be located in Columbus.

Chrome Ore in Cuba

The owner of a chrome deposit located in the Province of Matanzas, Cuba, is desirous of establishing contact with consumers in the United States. The property is now idle but if a steady market can be located the owner states that delivery to the port of Havana can be commenced within a month. Analysis of the ore shows content of: Cr_2O_3 43.84 per cent, iron 12.2 per cent, silica 1.05 per cent. The owner of this deposit is seeking a market for the ore, not the sale of the property. Further information will be furnished on direct request to Minerals Division, Bureau of Foreign and Domestic Commerce, Washington.

New August Record in Iron Output

Daily Rate Less Than July by Only 949 Tons or 0.75 Per Cent—Eight Months' Total 1,213,000 Tons Over Next Largest—Net Loss of Six Furnaces

AUGUST pig iron production established two new records—the largest for that month in history and a new high total for the first eight months of any year.

From returns collected by wire on Tuesday, Sept. 3, the August output was 3,755,680 gross tons or 121,151 tons per day for the 31 days. This compares with 3,785,120 tons for the 31 days in July when the daily rate was 122,100 tons. This is a loss in daily rate of 949 tons or about 0.75 per cent. The next largest August was 111,274 tons per day in 1923.

New Record for Eight Months

For the eight months ended with August the total production was 29,181,760 tons. The nearest approach to this was the 27,969,000 tons to Sept. 1, 1923—an increase of about 1,213,000 tons, or 4.3 per cent. Compared with the first eight months' output in 1928 of 24,729,315 tons, the increase this year was 4,453,445 tons, or 18 per cent.

Rate of Operation on Sept. 1

There were 210 furnaces operating on Sept. 1 with an estimated operating rate of 119,130 tons per day. On Aug. 1, there were 216 furnaces active, having an estimated operating rate of 121,965 tons daily. There were nine furnaces shut down dur-

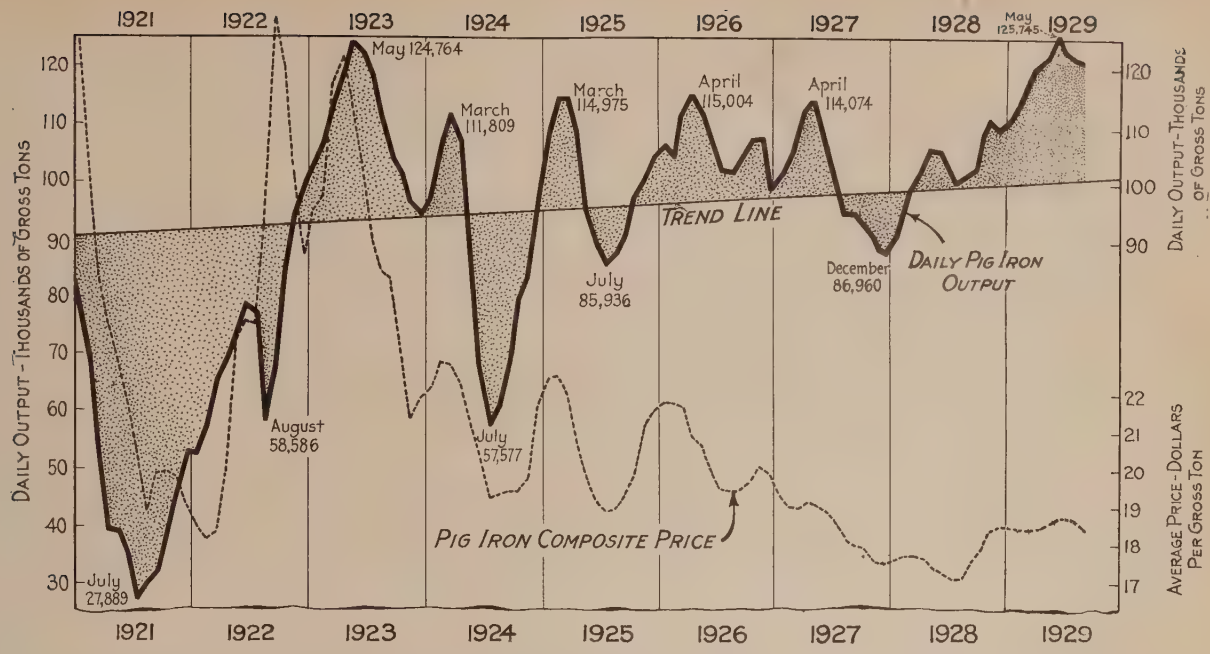
*These totals do not include charcoal pig iron. The 1928 production of this iron was 142,960 gross tons.



Production of Pig Iron So Far This Year Has Averaged Slightly Over 120,000 Tons a Day

Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 423,000 tons

ing August and three blown in—a net loss of six furnaces. This compares with a net loss of two furnaces during July.

Independent steel companies did not blow in any furnaces during August but they blew out one. The Steel Corporation blew in two furnaces and shut down four. Four merchant furnaces were blown out in August and only one was blown in. There was therefore a net loss of three steel-making and three merchant furnaces.

Loss in Merchant Iron

The loss in merchant iron during August was 1805 tons per day, the daily rate being 22,251 tons against 24,056 tons in July. In steel-making iron there was a gain of 856 tons per day, or 98,900 tons per day in August and 98,044 tons per day in July.

Ferromanganese in August

There was 28,461 tons of ferromanganese made in August as against 31,040 tons in July. The August output was the third largest this year. Two companies were making spiegeleisen on Sept. 1.

Furnaces Blown In and Out

Only three furnaces were blown in during August: No. 3 Isabella furnace of the Carnegie Steel Co. in the Pittsburgh district; the Colonial furnace in western Pennsylvania, and the Cherry Valley furnace in the Mahoning Valley.

There were nine furnaces blown out or banked during August: One furnace of the Witherbee-Sherman Co. at Port Henry, N. Y.; "B" furnace at the Bethlehem plant of the Bethlehem Steel Corporation in eastern Pennsylvania; one Duquesne and one Edgar Thomson furnace of the Carnegie Steel Co. in the Pittsburgh district; one River furnace in northern Ohio; one furnace of the Minnesota Steel Co. in Minnesota; and one Pioneer furnace of the Republic Iron & Steel Co., one Ensley furnace of the Tennessee Coal, Iron & Railroad Co., and the Tuscaloosa furnace in Alabama.

*Includes output of merchant furnaces.

Empire Steel to Increase Open-Hearth Capacity

The Empire Steel Corporation will enlarge its steel-making capacity at Mansfield, Ohio, by the erection of two new 100-ton open-hearth furnaces, making six in all. With the additional melting equipment, this company will make steel for something over 60 per cent of its total requirements. The present open-hearth building will be extended and a new ladle crane, charging machine and other equipment will be added to provide a complete unit.

The group life insurance plan of the General Electric Co. has been revised so that premiums paid by new employees will be in accordance with their age rather than an average rate common to all employees. Plans for free insurance and additional pensions, also equalizing benefits according to age, have been announced.

Iron and Steel Markets

Decline in Pig Iron Output Is Slight

August Production Only 0.75 Per Cent Below July—Steel Output Shows Little Change, Although Tapering—Steel Prices Reaffirmed

PIG iron production in August was a record for that month and was the fourth largest output for any month. At 3,755,680 tons, the August total is exceeded only by the figures for July and May, 1929, and May, 1923. The decline from the previous month was only ¾ of 1 per cent.

In daily rate of output August ranks sixth with 121,151 tons, being surpassed by the months mentioned and by June, 1923, and June, 1929. The next largest August production was in 1923, when the daily average was 111,274 tons.

Pig iron output thus far this year, at 29,181,760 tons, has established a new eight months' record, forging ahead of the previous high mark, for the corresponding period in 1923, by 4.3 per cent.

A further tapering of output in September is indicated by a net loss of six active furnaces and a daily operating rate of 119,130 tons on Sept. 1, compared with 121,965 tons for the 216 stacks in blast Aug. 1.

The trend of steel ingot production in September also appears to be downward. Although no marked recession is looked for, mill backlogs are still being reduced and the full effects of fall demands will probably not be felt until October. Steel producers plan to take advantage of the breathing spell to make long delayed and much needed repairs to open-hearth furnaces and other equipment.

Whether expectations will be fully realized is, of course, open to question, since the vitality of steel demand has been a surprise to producers and consumers alike throughout the year. Thus far in September, aside from the temporary effects of the holiday interruption, there has been no appreciable change in operating conditions. The larger producers, owing to the diversification of their output, continue to run at 90 to 95 per cent of ingot capacity, and will probably not drop below a 90 per cent rate for several weeks. The current average for Steel Corporation subsidiaries is estimated at 94 per cent. On the other hand, output for some of the smaller producers has dropped to 85 per cent or less.

The middle of this month is now expected to mark the beginning of a fall buying movement in steel, following the completion of the vacation period and the formulation of programs for the remainder of the year by the directing executives of steel consuming companies.

In rails autumn demand has already set in, with an inquiry for 8000 tons from a Southwestern road and with fully 30,000 tons expected to come into the market in the next fortnight.

In structural steel, likewise, there are signs of expanding demand. For a leading Eastern producer of plain material, increased business toward the end of August brought the month's bookings 10 per cent above July. The unusually large amount of prospective tonnage in fabricated steel work has been augmented by fresh inquiries for 30,000 tons, including 10,000 tons for the Chicago *Tribune* Tower, Chicago. Structural steel work likely to be awarded in New England in the last quarter is double the tonnage placed in the corresponding period in 1928. Structural lettings of the week, at 26,000 tons, were light.

The automobile and railroad equipment industries remain the chief uncertainties affecting the immediate outlook in steel. A substantial tonnage of automobile body sheets for the final quarter has been placed at 4.10c., Pittsburgh, and considerable additional business in sheets from some of the motor car builders is pending, with prospects for a decided improvement in demand from that source before the end of the month, as production gets under way on new models.

Existing prices are being reestablished on most forms of finished steel, but thus far little fourth quarter contract business has actually been taken. A notable exception is the placing of automobile body sheets at 4.10c., following the disappearance of concessions of $2 a ton. Fourth quarter prices named on other finishes of sheets by a number of companies are 2.85c., Pittsburgh, for black, 2.35c. for blue annealed, 4.20c. for metal furniture sheets and 3.90c. for vitreous enameling stock.

The competitive situation in the pig iron market appears to be growing less acute, following heavy sales by Alabama furnaces, which have reduced their stock piles and buttressed their backlogs. Although $12.50, Birmingham, is still quoted on the Eastern seaboard, higher prices are now being asked in the Middle West. Pig iron buying has been in fair volume in the East, but considerable fourth-quarter business is still to be placed throughout the country.

Lake shipments of iron ore in August, at 10,806,967 tons, broke all monthly records, surpassing the previous high mark of 10,709,260 tons reached in August, 1926. The movement for the season until Sept. 1 was also a record, aggregating 43,717,787 tons.

Scrap markets show little change except at Pittsburgh, where an easier tone is reflected in a decline of 25c. in heavy melting grade to $18.75 a ton.

THE IRON AGE composite prices are unchanged, pig iron at $18.25 a ton and finished steel at 2.398c. a lb. Both are about $1 a ton higher than a year ago.

Pittsburgh

Decline in Steel Output This Month, If Any, Will Be Gradual—Some Uncertainty as to Fall Prospects

PITTSBURGH, Sept. 3.—The general suspension of operations over the holiday week-end will cut down aggregate steel output for the initial week of the new month, but last week mills were run at a rate not far below 95 per cent of capacity.

Gradual decline during the month is anticipated, but, with the larger steel producers in the district operating at close to capacity, the average is not likely to fall much below 90 per cent. Unless demand for finished steel products is showing marked improvement by the end of the month a much sharper decline in ingot production is to be expected.

Specifications slackened in nearly all lines of finished products during the last two weeks in August, but shipments were well sustained, and the aggregate movement of steel from local mills during the month was not very much below that in July.

In bars, shapes, tin plate, strip steel and some finishes of sheets backlogs were sharply reduced. Semi-finished steel was available in satisfactory quantities and mills were able to ease the pressure for deliveries on all products except plates and sheets. On plates, delivery promises still range from four to six weeks, while a few of the larger sheet mills are scheduled at close to capacity for the remainder of the month.

Prospects for increased steel consumption during September are still rather uncertain. Rail tonnages are expected to be placed earlier than usual this year, beginning probably before another month has passed.

Reports are heard of possible heavy car purchases in the near future, but current inquiries are light and near-by car shops are completing old orders rapidly. River transportation companies are expected to place a large number of barges this fall, as the river improvement program is to be entirely completed next month and inland water transportation will be fully taken advantage of by many additional shippers.

Indications of heavier buying by automobile companies are beginning to appear and a few rush orders for sheets from Michigan companies have recently come to local mills. It is thought that shipments of automobile steel will not decline much further and will show considerable improvement before the end of the month as motor car makers get into production on new models.

Farm implement makers served by Pittsburgh district mills are beginning to get into production on next year's probable requirements and shipments of steel are increasing.

Pipe prospects are good and present mill operations are comparatively high. A number of large line pipe projects are in prospect and feeder pipe for lines under construction is now accounting for considerable tonnage appearing on mill schedules.

The pig iron market is showing its first signs of real activity since early summer. Fourth quarter inquiries are beginning to come before the trade. Scrap is weaker, mill buying still being limited.

Pig Iron.—Sellers in this district

report increasing interest in fourth quarter tonnage, although few actual inquiries have come before the trade. However, consumers' stocks are at a minimum and most of them have no iron coming on old contracts. This leads to the belief that there will be heavy buying of all grades of iron in September in both the Pittsburgh and Valley districts. The leading merchant interest reports considerably better sales than were expected during August, although most of the transactions involved small tonnages. Shipments also held up well during the month, considering the fact that a light foundry melt is usual at this time of the year. The Westinghouse Air Brake Co., Wilmerding, Pa., has closed on a tonnage of foundry and malleable iron for delivery over the remainder of the year. This business was divided between the local merchant interest and a Valley maker, and the malleable is said to have been taken at $20.26, delivered. This figures back to $19.50, Pittsburgh district furnace, and $18.50, Valley, the shading of the Valley price having been necessary to meet the local competition. In the immediate Valley territory, quoted furnace prices are holding, and a recent sale of 3000 tons of basic iron in that district brought the full quoted price of $18.50. Foundry iron is holding at the same figure, while malleable and Bessemer are offered at $19, Valley furnace. The Pittsburgh local furnace is quoting prices 50c. above these figures.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-finished Steel. — Non-integrated steel makers are beginning to show interest in their fourth quarter semi-finished steel requirements, and, in contrast with the present quarter, are expected to cover early. In the third quarter they had sufficient steel under contract to last for several weeks and in most cases were able to supplement this with small extensions of contracts just sufficient to carry them into the fall. For the fourth quarter they will need to buy their usual tonnages, and the question of price is again assuming importance. During this quarter the price on spot tonnages of billets and slabs has been $35, Pittsburgh or Youngstown, and although little has been moving at that figure, any open reduction for fourth quarter contracts would give the market a weak tone which the large sellers, who are also makers of finished steel products, are particularly anxious to avoid at this time. On the other hand, buyers of semi-finished steel are not going to pay more for their supplies without vigorous protest. On sheets bars, there is little argument, as the price has held at $35 all the year, an advance to $36 for a few months in the spring having been purely nominal. There is no reason to expect any change in the sheet bar price for the last quarter. The same thing is true of wire rods, which have held at $42, Pittsburgh or Cleveland, during the year.

Bars, Shapes and Plates.—Deliveries on bars and shapes are constantly improving, but plate tonnage is coming to local mills at about the rate at which it is going out. New orders for plates, however, are diminishing and by the middle of October the bulk of the shipments to the railroad car and barge builders will have been made. Unless a fresh buying movement in cars or barges develops by that time, plate tonnages are likely to slip off sharply. Structural mills are still operating at a high rate, particularly on the heavier materials going into bridges. But fabricating shops are rapidly working into their backlogs and even the larger interests will soon begin to need business. Large new projects in the district are developing slowly, but formal inquiry is expected shortly on a bridge over the Ohio River at McKee's Rocks, which will require 15,000 tons of shapes. An addition to the Bell Telephone Building in Pittsburgh will also call for a round tonnage. Shipments of reinforcing bars are holding up, but awards have declined and the bulk of buying on road and other construction jobs to be completed before cold weather sets in has been completed. The merchant bar business has naturally felt the decline in demand for automobile steel, but agricultural implement makers served by Pittsburgh mills are specifying freely and expect heavy fall operations. Prices on the heavy hot-rolled products are holding at 1.95c., Pittsburgh.

Wire Products. — Manufacturers' wire shipments in August were just about equal to those of July and considerably ahead of those in August, last year. However, specifications declined somewhat during the past month and prospects for September are rather uncertain. Prices on manufacturers' wire are holding at 2.50c., Pittsburgh, but it cannot be denied that the weakness in prices to jobbers in nearby territories is having a depressing influence on the market. Nails and barbed wire are also weak in both demand and price. Some improvement in jobber demand for fencing is expected in the next few weeks.

Tubular Goods.—No new developments are reported in the large line pipe projects which have been talked of recently. The line to run from Texas into Chicago by way of Omaha, which is being sponsored by the Texas Co., is now reported to have been placed tentatively some time ago with the Milwaukee fabricator. Another line into Chicago with a similar origin is also being considered by the Doherty interests, and Pittsburgh and Youngstown pipe makers have been asked to prepare estimates. It is stated by informed persons that neither of these lines is a certainty and that negotiations may lead to the abandonment of one plan and the concentration of both interests in one project. Demand for butt-weld pipe shows little change and apparently has not been influenced by the reported increase in building proj-

Strips, Worcester	2.90c. to 3.00c.
Fender stock, No. 20 gage, Pittsburgh or Cleveland	4.25c.

*According to size.

Wire Products

(Carload lots, f.o.b. Pittsburgh and Cleveland, to jobbers and retailers.)

	Base per Keg
Wire nails	$2.55 to $2.65
Galvanized nails	4.55 to 4.65
Galvanized staples	3.25 to 3.35
Polished staples	3c. to 3.10c.
Cement coated nails	$2.55 to $2.65
	Base per 100 Lb.
Bright plain wire, No. 6 to No. 9 gage	$2.40 to $2.50
Annealed fence wire	2.55 to 2.65
Spring wire	3.50 to 3.60
Galv'd wire, No. 9	3.00 to 3.10
Barbed wire, galv'd	3.20 to 3.30
Barbed wire, painted	2.95 to 3.05
Woven wire fence (per net ton to retailers)	65.00

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass. (wire), mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Cut Nails

	Per 100 Lb.
Carloads, Wheeling, Reading or Northumberland, Pa.	$2.70
Less carloads, Wheeling or Reading	2.80

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1¼% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2½ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3½ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

ects during July and August. The year as a whole has been far from satisfactory in this product. Shipments of mechanical tubing are declining, but still are at a high rate for this season. Demand for boiler tubing is fairly good and there is a satisfactory movement of locomotive tubing.

Strip Steel.—Hot-rolled strip mills began the week with operating schedules well below 75 per cent of capacity, while cold-rolling units will do little better. Business has been reduced strictly to a hand-to-mouth basis and specifications received during the next week or two may lead to improvement on very short notice. On the whole, however, heavier shipping orders are not expected to develop before the end of the month, as at at least two points, and other users made in this and nearby districts goes to the automobile industry. Companies supplying the Ford Motor Co. are in a fairly good position, but this company's sources of supply are scattered, with no maker receiving enough tonnage to maintain a very high operating rate at this time. In the face of declining demand, prices are holding remarkably well, with the hot-rolled material quoted at 2c., Pittsburgh, for 6-in. and narrower, and 1.90c., for the wider sizes. On cold rolled, quotations range from 2.75c. to 2.85c., Pittsburgh or Cleveland, depending on the tonnage.

Cold-Finished Steel Bars and Shafting. — Shipments last month were at a fair rate for this season of the year and showed little change from July. No marked improvement in demand is expected early this month, but present specifications are coming from diversified sources and the industry is in a healthy condition. Particular satisfaction is derived from the price structure, as quotations are steady at 2.30c., base Pittsburgh. On fourth quarter business, the recently announced card of extras becomes effective and producers will soon open their books for that period.

Sheets.—Trends in the sheet market are mixed and, while a number of independent companies report a marked decline in specifications during the last two weeks of August, one of the largest makers reduced its obligations during the month only 1 or 2 per cent. The leading interest operated its mills last week at as high a rate as any during the year, the percentage having been barely under 100. One large independent company in this district is also at capacity, while others range down to about 90 per cent. The average for the industry as a whole is certainly not below 95 per cent, although this high rate is rapidly reducing the backlogs of many companies. With few exceptions, deliveries on all the common finishes of sheets can be made in four weeks or less, and with some companies immediate rolling schedules may be arranged. All the large sheet consuming industries, except the automobile, are still very active users, and large makers of special finished sheets are in a particularly favorable position. The requirements of the agricultural implement industry are large and seem to be tending toward increases. Heavy shipments are going to the railroad car builders, but car shops in this district are rapidly completing recent orders and will sharply curtail their steel orders in about six weeks unless more car orders are placed. Prices are no weaker, and leading independent manufacturers of galvanized sheets are soon expected to withdraw the $2 preferential to jobbers, which has been largely responsible for price weakness over the last year. Jobbers and also some consumers are still able to buy galvanized sheets at 3.50c., Pittsburgh, but some mills are firmly adhering to the 3.60c. base. On black sheets, the prevailing price is 2.85c., Pittsburgh, and no further weakness in blue annealed is reported. The 4c., Pittsburgh, price on automobile sheets mentioned last week has been made only in isolated cases to very large buyers and the general market is better represented by 4.10c.

Tin Plate.—Operations in Pittsburgh and tributary districts last week averaged a little better than 75 per cent of capacity, but would have been somewhat higher this week had it not been for the holiday. The leading interest operated its mills at better than 85 per cent, and will continue that schedule. Little improvement is expected this month, as the present season's requirements of the larger container manufacturers have nearly all been shipped, and it is too early for next year's tonnage.

Coal and Coke.—The coke market has not gained strength in the last week, but production has been further adjusted to reduced demand and quotations of less than $2.75, Connellsville, on the furnace grade are soon expected to disappear. Shipments of foundry coke have not improved, but demand seems to be somewhat better and a stronger price situation is developing. Coal demand is also improving seasonably, but prices have gained little strength.

Old Material.—In another week of very little mill buying, prices seem to be somewhat weaker, and No. 1 heavy melting steel is now quotable at $18.50 to $19. One consumer was able to buy a small tonnage at $18.50, but dealers are paying this price and more to cover old sales, and it is unlikely that any large tonnage will be sold at this time at much under $19. The closing of the Pennsylvania Railroad list tomorrow is being anxiously watched by dealers in this district and will probably indicate to some extent the trend of the market. Shipments of scrap to local mills are still rather heavy, although open-hearth operations have been considerably reduced at at least two points, and other users have held up shipments in order to clear up stock piles or rearrange their yards. The course of the market for steel-making scrap during the next two months will depend entirely upon the rate of steel operations. Some of the other grades are slightly weaker, particularly machine shop turnings and short shoveling steel turnings, which have recently been quoted at rather high levels as a result of heavy buying to supplement the use of the higher-priced grades of steel. The monthly list of the Baltimore & Ohio Railroad, which will close on Sept. 9, contains 19,000 tons of steel scrap, including 6000 tons of rails and 2000 tons of No. 1 heavy melting.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.50 to $19.00
No. 2 heavy melting steel	16.50 to 17.00
Scrap rails	18.00 to 18.50
Compressed sheet steel	18.25 to 18.75
Bundled sheets, sides and ends	17.00 to 17.50
Cast iron carwheels	16.50 to 17.00
Sheet bar crops, ordinary	20.00 to 20.50
Heavy breakable cast	12.50 to 13.00
No. 2 railroad wrought	18.50 to 19.00
Hvy. steel axle turnings	16.50 to 17.00
Machine shop turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.75 to 22.25
Railr. coil and leaf springs	21.75 to 22.25
Rolled steel wheels	21.75 to 22.25
Low phos. billet and bloom ends	22.50 to 23.00
Low phos., mill plates	22.50 to 23.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	20.50 to 21.50
Heavy steel axle turnings	16.50 to 17.00
Electric Furnace Grades:	
Low phos., punchings	20.00 to 21.00
Hvy. steel axle turnings	16.50 to 17.00
Blast Furnace Grades:	
Short shoveling steel turnings	13.00 to 13.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Milled studs	70

Chicago

Steel Specifications Expand Slowly After Moderate Recession—Ingot Output Still at Near-Capacity Rate

CHICAGO, Sept. 3.—Specifications for finished steel are expanding, after several weeks in which no gains were recorded. The improvement is not impressive from the standpoint of reflecting larger output by the major manufacturing groups which cut production in the early summer months.

There is still some uncertainty as to the course of business in farm machinery, though at the moment activity is at a substantial pace. Scattered reports lead to the impression that automobile production is a trifle heavier, but schedules for steel shipments reflect this only in small degree.

Railroad car builders are close to the point when new orders will come too late to prevent a drop from the present rate of building. The only order of moment this week is for 500 underframes placed with a Western builder. It is reported that action will not be taken until Sept. 12 on 1000 cars to be purchased by the St. Paul. The prospect for locomotive business from Western railroads is more favorable. The Frisco Lines are contemplating coming into the market; the Missouri Pacific is considering 25 new locomotives and the Burlington may buy 10 engines.

Broader interest in new building construction is shown by reports from many of the cities in the West. A large office and hotel project is well under way in Cincinnati. Several new buildings requiring large tonnages of steel are being planned at Milwaukee. At New Orleans, the outlook is reported bright for the fall months.

Taken as a whole, the local steel market remains as in recent weeks. Output of steel ingots is near capacity, though signs are increasing that curtailment may be necessary late in September. New sales do not sustain backlogs. Improvement in deliveries tends only to make users more insistent on still better promises.

Pig Iron.—The Federal furnace, which has been down for repairs, was relighted Sept. 1, and the Iroquois stack, which also has been out for needed repairs, will be blown in about Sept. 15, according to present plans of the operators. Active merchant stacks now number five, including the Zenith furnace at Duluth. Prices for Southern iron are still mixed. One producer is said to have withdrawn from the market with full order books. Others are quoting $13.50 a ton, Birmingham, for tonnage lots and $14 for small orders. Delivery at Chicago is figured on the all-rail rate, bringing the asking delivered price range to $19.51 to $20.01. Against these prices, however, is a sale of 1500 tons made early in the week to a western Illinois melter at $12.50 a ton, Birmingham. Shipments of silvery are steady and sales total about 1000 tons in the last week. Orders for charcoal iron range from carloads up to 150 tons each. The Northern iron market is well established at $20 a ton, local furnace.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$18.51 to 19.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Consumption of spiegeleisen continues at a high rate. New buying is dull. Several small lots of ferromanganese have been taken at $105 a ton, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Sheets.—Roofers are building up fall stocks of galvanized sheets and, as a result, have stimulated the demand for this grade of sheets. Current sales are in good volume at prevailing prices. However, producers have not opened books for the fourth quarter and consumers generally will make commitments only for nearby needs. Specifications match production, which stands at 80 per cent of capacity. Light tank makers are well engaged. The Inland Steel Co. has announced the following sheet prices which are to become effective at once for the remainder of the year: Blue annealed sheets, No. 10 gage, 2.30c. a lb., Chicago district mill, and No. 13 gage, 2.45c.; galvanized, 3.70c., and black sheets, 3.05c. a lb. at the mill.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Hot-Rolled Strip Steel.—The Acme Steel Co. has opened fourth quarter books on hot-rolled strips at present quotations.

Cold-Rolled Strip.—Although books are open for fourth quarter, buyers are showing little interest in future needs. Current specifications are in smaller volume than a week ago and output has been reduced to 65 per cent of capacity. It is reported here that consumption of cold-rolled strips by the automobile industry in August was a trifle larger than in July.

Bars.—Both sales and specifications for mild steel bars show some improvement over the average of recent weeks. New orders, however, fall far short of shipments, and producers' backlogs are steadily declining. Demand is broad and well diversified. Both farm implement and automobile manufacturers are taking bars at a steady rate. It is the impression here that the automobile industry will place heavier specifications about the middle of September. Road machinery builders and crane shops are operating at close to capacity, a situation which has prevailed throughout the year. Output of alloy steel bars holds steady at 70 per cent of capacity. Specifications are equal to shipments, but new buying is in small volume and backlogs are light. Prices for iron bars are steady at 2.05c. a lb., Chicago. With much of the railroad needs out of the way, both new business and releases against old obligations are light. Rail steel bar mills continue to operate on a double-turn basis, though in some cases hours have been cut. Prices remain steady at 1.95c. a lb., Chicago Heights, and it is the general impression that there will be no change when books are opened for the fourth quarter. Deliveries range from two to three weeks. Stocks of fence post material are in good shape for the expected fall demand, which is beginning to make itself felt.

Rails and Track Supplies.—Rail mill operations hold to 70 per cent of capacity and schedules are arranged for September. Fresh inquiry is for 8000 tons for a Southwestern railroad, and it is rather commonly expected by the local trade that fully 30,000 tons for fall rolling will be in the market by the middle of September. New orders for light rails can be measured only by a few carloads; however, shipments in the last four weeks have been well above the average for several years.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Structural Material.—Although deliveries on shapes have been steadily improving, the range now being four to six weeks, fabricators find it difficult to obtain steel to meet their obligations. Contractors are rushing work to avoid erection in cold weather. Shops, still pursuing the policy of holding stocks at a minimum, report mill deliveries unsatisfactory. The general level of prices being obtained for fabricated material is too low to permit shops to draw on warehouses, and, moreover, the character of much of the material needed is not of the kind and size usually carried by jobbers. The net result is that mills are being forced to rearrange schedules whereby deliveries on some shapes can be given in 10 days. Fresh inquiry is developing over a wide territory. At Chicago, more than 10,000 tons will be needed for an addition to the Chicago Tribune plant. At New Orleans, where a new pumping station is being considered, the building program is steady and the outlook is considered satisfactory. New office buildings requiring round tonnages are

being projected at Louisville, Ky., Des Moines, Iowa, and Milwaukee. At Cincinnati, there will be erected on property owned by the Presbyterian Church a 43-story office, hotel and garage building. The Foshay Tower addition at Minneapolis, which calls for 1700 tons, has been awarded to a Chicago fabricator.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Cast Iron Pipe.—This market remains listless, though there is now more indication that heavier purchases may be made in the late fall. A number of municipalities which elected new officials last spring are arranging programs, and several engineers state that plans are near completion for several sizable water main projects. Northfield, Ill., has awarded 200 tons of cast iron pipe to a contractor, and Crystal Falls, Mich., has closed for 100 tons of 10-in. pipe with the Central Foundry Co. Lamar, Colo., has placed 12 miles of pipe. The 14-in. pipe is reported to have been taken by the United States Pipe & Foundry Co., and the smaller sizes by the McWane Cast Iron Pipe Co. Chicago is giving consideration to the purchase of a large tonnage of 48-in. feeder mains. Carload orders are fewer in number, except from the railroads, which are finding wider use for cast iron pipe. Prices are steady and deliveries are prompt on most sizes.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Bolts, Nuts and Rivets.—Shipments of these commodities in August were about 10 per cent lighter than in the corresponding month last year. Fourth quarter contracts are being prepared at unchanged price schedules. Output is near 70 per cent of capacity, and stocks in the hands of producers are in good condition for the fall trade. Specifications continue at the August rate.

Wire Products. — Production of wire products has been cut to 63 per cent of capacity as demand dwindles. At this rate shipments are equal to production and mill stocks remain stationary, except in woven wire fencing, in which commodity an effort is being made to increase quantities in the hands of producers. The jobbing trade finds demand less insistent, while on the other hand the use of manufacturers' wire is holding at a level even with that in the previous week. Shipments of nails are light and prices are weak, as shown by concessions often granted from current quotations. Use of reinforcing mesh is fully equal to that of a year ago at this time. Shipments are large as contractors order out material with the expectation of completing contracts before frost. Western producers of wire and wire products anticipate an active fall trade, which they believe will open about the middle of September.

Plates.—Total inquiry for tank plates, augmented this week by 5000 tons for two new projects, is in excess of 14,000 tons. One project calls for 2500 tons for delivery in the Southwest and a like tonnage is before the trade for export. The Winkler Engineering Corporation, Wichita, Kan., has ordered 750 tons of tankage which will be fabricated at Joliet, Ill. Local plate shops are well engaged and have satisfactory backlogs. It is reported from St. Louis that makers of large tanks are only moderately busy, while light tank manufacturers are operating double turn with large orders ahead. Diversified orders for plates are in fair volume. Chicago producers will promise deliveries in four to 10 weeks, and when orders match with rollings somewhat better can be done. Producers in the East name three weeks or better. It is reported that definite action will not be taken on the 1000 cars for the St. Paul railroad until about Sept. 12. The local plate market is strong, with prices remaining firm at 2.05c. a lb., Chicago.

Reinforcing Bars.—Bending shops in this district are increasing output as a result of recent orders. Several fabricators are now engaged at close to capacity, while for the district as a whole the increase is not far from 10 per cent. The enlarged volume of contracts, as well as some stimulation in new inquiries, is bringing about a more determined effort to get higher prices, but bids already submitted are checking this move. Rail steel bars are commonly quoted at 1.85c. to 1.95c. a lb., Chicago Heights, and the billet steel commodity brings 2.15c. a lb., Chicago, with less desirable business being taken at 2.35c. Large awards are absent from the market this week, but small tonnages, many of which are for alteration work, are more numerous than in recent weeks.

Coke. — Shipments of by-product foundry coke are approximately equal to local oven capacity. With the bulk of users under contract for the remainder of the year, current buying is of little moment. The price remains at $8 a ton, Chicago ovens.

Old Material.—Both tendencies and opinions in the Chicago scrap market are decidedly mixed. One mill has bought 5000 tons of heavy melting steel at $15.75 a ton, delivered, which is the price reached in the recent advance. Short interests contend that lower prices are in the offing, while there are those who confidently believe that the market may rise to higher levels. Balanced against the prospect of lighter demand for the heavy tonnage grades are lack of stocks in yards, curtailment of production of scrap and the fact that many makers, who in some cases are also buyers of scrap, are holding tonnages in anticipation of higher prices. Demand for specialties, especially from malleable and steel foundries, is well sustained. A 1000-ton order for railroad malleable has been placed by a melter at Peoria, Ill., at $18.50 a gross ton, delivered. Gray iron foundries are using smaller quantities of scrap. Taken as a whole, there still seems to be a good balance between consumption and production of scrap, and on this score some sellers look for a steady market. The Pennsylvania will sell 50,000 tons on Sept. 4.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$15.25 to $15.75
Shoveling steel	15.25 to 15.75
Frogs, switches and guards, cut apart, and misc. rails	16.75 to 17.25
Hydraul. compressed sheets	13.75 to 14.25
Drop forge flashings	10.75 to 11.25
No. 1 busheling	13.25 to 13.75
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	17.00 to 17.50
Low phos. plates, 12 in. and under	17.00 to 17.50
Blast Furnace Grades:	
Axle turnings	13.00 to 13.50
Cast iron borings	10.50 to 11.00
Short shoveling turnings	10.50 to 11.00
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	18.00 to 18.50
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	20.00 to 20.50
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.50 to 22.00
Iron car axles	26.50 to 27.00
Steel car axles	17.50 to 18.00
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.75 to 14.25
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

New York

Pig Iron Bookings 25,000 Tons, Sharp Competition Stimulating Demand—Structural Steel Orders Heavier

NEW YORK, Sept. 3.—Sharp competition in the pig iron market appears to have stimulated demand. Bookings for the week, including sales of iron for shipment to plants outside this district, totaled 25,000 tons. An inquiry for 10,000 tons of basic for a Bridgeport, Conn., plant, is reported still pending. The Thatcher Co., Newark, N. J., has closed for 2000 tons of foundry for its Garwood, N. J., works. The General Electric Co. has placed orders for 5000 tons for its Schenectady, N. Y., Bayway, N. J., and New England foundries. The American Radiator Co.'s purchases over the past three weeks have totaled 22,000 tons, and it still has 15,000 tons to buy for plants in various districts. Southern and eastern Pennsylvania irons have figured more largely in recent transactions than Buffalo brands. Alabama foundry grade is still available at as low as $12.50, base Birmingham, although higher prices are asked when Northern manganese specifications are duplicated. No. 2 plain from eastern Pennsylvania is being sold at $19, furnace, for delivery in this section, and that price has been shaded in a few instances. Buffalo foundry iron still ranges from $17.50 to $18, base furnace, with the price attitude of producers tending toward greater firmness. Buffalo producers have been shipping more iron to Detroit and Chicago than last year, and are not burdened with excessive stocks at furnaces. One steel works interest is reported to have virtually withdrawn from the market, and another Buffalo steel plant is conserving its pig iron supplies because of furnace trouble. The Port Henry, N. Y., stack, which was recently blown out for relining, will not get back into blast for about six weeks. Pig iron shipments are going forward to foundries without interruption; in fact, melt shows some sign of improving. Better operations are noted in the radiator industry, which has been running at 55 to 60 per cent of capacity for several months.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 22.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Cast Iron Pipe.—Prices are unchanged and show no tendency to advance. Northern foundries are well occupied with the larger sizes of pressure pipe, but are seeking tonnage in the smaller diameters. The United States Army has awarded about 75 tons of 8 and 12-in. centrifugal pipe for Camp Stotsenburg at Manila, P. I., to the American Cast Iron Pipe Co. Private buying has been limited to occasional carload lots. About 6000 tons of water pipe for the Eastman Kodak Co., Rochester, N. Y., has not yet been awarded.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Warehouse Business. — Although August sales of material from stock compared favorably with July, the second half of the month was rather quiet. Consumers have been limiting their purchases to small orders. Black, galvanized and blue annealed sheet prices are still subject to occasional shading on desirable business.

Reinforcing Bars.—Although small lettings have been fairly numerous, jobs running 100 tons or over have been scarce. Prices are unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—The leading Eastern producer of structural steel states that the increased rate of bookings during the latter half of August, as compared with the slackened buying in the first half, brought the total for the month to a point 10 per cent above July orders. Structural awards have been holding up well for this time of the year. A considerable portion of the tonnage in the New York metropolitan area is going into apartment buildings and non-industrial structures of various kinds. A substantial amount of plate business is pending, including 2000 tons for a car builder near by. Prices of bars, shapes and plates are firm and unchanged. A few fourth quarter inquiries have appeared, but mills are not yet ready to accept orders for that period. However, they have indicated that quotations for delivery over the remainder of the year will stay at the current level. An important sheet steel manufacturer reports that August sales exceeded those of July by a comfortable margin. Some sheet mills still are engaged at capacity. Prices are firm at 3.50c., Pittsburgh, for galvanized, 2.85c. for black and 2.35c. for No. 13 gage blue annealed. The wire market is rather dull, with little fresh business coming out at the moment. Common wire nails are priced at $2.50 to $2.55 a keg, Pittsburgh, and plain wire at $2.40 a 100 lb., Pittsburgh.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—Prices on furnace coke are easier. Better beehive grades, recently held at $2.80 a net ton, Connellsville, are now available at $2.70, with $2.65 a possibility. So-called standard furnace coke ranges from $2.60 to $2.65, Connellsville. Special brands of beehive foundry coke are still bringing $4.85, Connellsville, or $8.76, delivered to northern New Jersey points. Other brands are available at as low as $3.75, Connellsville. By-product foundry coke is quoted at $9 to $9.40 a net ton, Jersey City or Newark, and $10.06, New York or Brooklyn.

Old Material.—No transactions of consequence have been reported in the past week. Consumers of scrap are in most cases offering to buy at the prices now being paid by brokers to fill their present contracts. As a result, prices have not developed any definite tendency either to advance or recede. No. 1 heavy melting steel is being bought at $16 to $16.50 a ton, delivered eastern Pennsylvania. No. 2 heavy melting steel is still moving in substantial tonnages to the consumer at Bethlehem, Pa., being taken in at a minimum reduction of $1.50 a ton from the price of No. 1 steel, or $15 a ton, delivered. As brokers are unable to offer more than $14.25 a ton, delivered to other eastern Pennsylvania mills, on the basis of contracts at $14.50 a ton, holders of this grade prefer to ship to Bethlehem.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to $13.35
Heavy melting steel (yard)	8.00 to 9.75
No. 1 hvy. breakable cast.	10.75 to 11.75
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.75 to 8.00
Short shoveling turnings..	8.00 to 9.00
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles	19.50 to 20.00
Iron car axles	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.25 to 13.75
Cast iron carwheels.....	12.50 to 13.00
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Michigan Shipments of Pig Iron to Increase

DETROIT, Sept. 3.—Scheduled pig iron shipments for September indicate an increase over July or August, and furnaces serving the district have no excess iron in stock.

There have been no changes in prices of old material. With the lower automotive production, current orders have been absorbing the scrap output.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.25 to $14.75
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast.....	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets....	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling.....	12.50 to 13.00
Old No. 1 busheling.....	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

The American Rolling Mill Co. has ordered two more 300-hp. oil-electric locomotives for use in the Ashland, Ky., plant. The units are to be duplicates of the four already in service, and are built jointly by the Ingersoll-Rand Co., General Electric Co. and the American Locomotive Co.

Philadelphia

Buying Has Slackened But Plate Mills Are Running Full—Galvanized Sheets Still Lack Firmness

PHILADELPHIA, Sept. 3.—Steel buying slackened last week, but mills are maintaining from 90 per cent to full operations. Plate mills are especially well engaged and still have considerable shipbuilding tonnage in prospect. Sheet demand is fair, but galvanized sheet prices still lack strength. Consumers of sheets are moderately active except in the radio manufacturing field, where there has apparently been a slight recession from original production programs in some instances.

Pig iron is quiet, but most of the eastern Pennsylvania basic users and large consumers of foundry iron have yet to cover their fourth quarter requirements.

The iron and steel scrap market is less active than at any time this year.

Pig Iron.—Withdrawal of the Republic Iron & Steel Co. from the pig iron market is believed by some Northern furnaces to have made the purchase of Southern basic iron by eastern Pennsylvania consumers less likely, as this interest has been offering basic with a lower phosphorus and higher manganese content than is usually produced in the Birmingham district. A user of basic at Coatesville, Pa., has inquired for 500 tons of special analysis for prompt shipment. Foundry iron buying has been light in the past week, but prices are being maintained fairly well, with small lots bringing $21, base furnace. While some foundries have bought iron for delivery beginning in this quarter and extending into the last quarter, a considerable number have not yet inquired for fourth quarter.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X.....	22.26 to 22.76
Basic (del'd east. Pa.)....	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)...	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Demand is still in small volume and deliveries are fairly prompt. The price is unchanged at 1.95c. a lb., Pittsburgh, or 2.27c., delivered Philadelphia.

Reinforcing Bars.—A number of small projects, each requiring less than 100 tons of reinforcing bars, are pending. Even on the small tonnages competition between billet steel and rail steel bar producers is keen. Prices are unchanged at 1.95c. to 2c. a lb., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, for billet steel bars. In many instances the usual extra of $5 a ton for cutting to length is not charged by the distributer. Rail steel bars are quoted at 1.95c. a lb., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length, and this price is occasionally shaded to obtain tonnage in competition with billet steel bars.

Shapes.—Operating rates of most mills are 90 per cent or more, and deliveries range from a week to three weeks. Fabricating shops are well engaged and are bidding on some substantial tonnages for erection this fall. Prices are unchanged at 1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia.

Plates.—In most instances eastern Pennsylvania mills are operating full, and in some cases deliveries of universal plates, which have been available in a few days, have become extended to a week or more. Buying has slackened somewhat in the past week, but this is considered to have been only a temporary lull caused by the holiday. The leading interest is reported to have received an order for 15,000 tons of plates for two ships to be built for the Export Steamship Corporation by the New York Shipbuilding Co. at Camden, N. J. Another lot of 15,000 tons is still to be awarded. Prices are unchanged at 2.05c., Coatesville, or 2.15c., delivered Philadelphia.

Sheets.—Blue annealed sheet prices are firm at 2.35c., base Pittsburgh, for No. 13 gage, or 2.67c., delivered Philadelphia, and light plates, blue annealed, are 2.10c. to 2.20c., Pittsburgh, for No. 10 gage, or 2.42c. to 2.52c., delivered Philadelphia. Black sheet quotations are fairly stable at 2.85c., Pittsburgh, or 3.17c., delivered

*For 50 bundles or more: 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more: 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Philadelphia, but galvanized sheets range from 3.50c. a lb., Pittsburgh, or 3.82c., Philadelphia, on desirable business to 3.60c., Pittsburgh, or 3.92c., Philadelphia. Although 3.50c., Pittsburgh, is the minimum at which galvanized sheet business has been taken in eastern Pennsylvania, Southern buyers claim to have bought at 3.40c., Pittsburgh. Local consumers of sheets have not been specifying so heavily in some cases as had been expected. A radio manufacturer is reported to be producing considerably less than originally planned in this year's production program.

Imports.—In the week ended Aug. 31, 1054 tons of pig iron arrived at this port from British India and 5300 tons of chrome ore was received from British South Africa. Steel imports consisted of 28 tons of drill steel, 1 ton of strip steel, 25 tons of iron bars, 8 tons of steel rods and 10 tons of steel billets from Sweden, 4 tons of strip steel and 4 tons of steel scrap from Germany and 21 tons of steel scrap from the United Kingdom.

Old Material.—No new scrap sales of size have been made in the past week, and, with eastern Pennsylvania consumers of No. 1 heavy melting steel well stocked at present, dealers have in most cases been offering only $16 a ton, delivered, to fill their contracts. New contracts for requirements to the end of the year are expected before long, but at present the market is decidedly inactive.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00 to 16.50
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.50
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	15.00
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Cleveland

Present Prices on Some Steel Products Extended to Fourth Quarter—Larger Automobile Buying Expected Soon

CLEVELAND, Sept. 3.—Present prices are expected to be reestablished for the fourth quarter on finished steel in about all forms except possibly on cold-rolled strip, for which makers are asking an advance of $2 a ton. A small amount of business in steel bars has been placed for that delivery by an extension of an existing contract. A Cleveland mill is quoting the current price on plates for the coming quarter. Several sheet mills making various grades except galvanized have named present prices for the fourth quarter, but no definite announcement seems to have been made as yet on galvanized sheets. Alloy steel bars are expected to be reestablished at the 2.65c. base.

Mills that have opened their books for the coming quarter are not yet seeking contracts for that delivery, and consumers as a rule are not yet showing much interest in contracts. A considerable tonnage in automobile body sheets for the last quarter was taken during the week, but with that exception little fourth quarter business has been placed.

Specifications with some of the mills increased a little during the week, but with others were very light. August made a good showing in the volume of business in steel bars, plates and structural shapes and the tonnage entered by some of the local sales offices exceeded that of both July, this year, and August of last year.

Inquiries from some of the automobile manufacturers for sheets are now pending for the fourth quarter, and considerable business is expected to come from that source during the next 10 days.

Some of the sheet mills which had recently curtailed production increased operations this week after the holiday shutdown.

Pig Iron.—Sales by Cleveland interests fell off somewhat the past week. However, there was a slight increase in activity in the nearby Cleveland district, where a number of smaller foundries came into the market for lots up to 300 or 400 tons of foundry and malleable iron for the fourth quarter. Low prices on Southern foundry iron have brought some business in competition with Northern grades in the northern, central and southern Ohio territories, but evidently they have not resulted in any weakness in Northern iron prices. Southern foundry iron is still available at $13.50, Birmingham, while $14 appears to be the maximum price. Lake furnace prices are unchanged at $18.50, Cleveland, for outside shipment and at $19 for local delivery. For Michigan delivery, $20 furnace is the ruling price. Shipments by some furnaces having heavy commitments with the automotive industry declined in August. However, local furnaces whose product is more generally distributed among various consuming industries shipped a little more iron in August than in July.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$19.50 to 20.00
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Bars, Plates and Shapes.—Specifications for steel bars are not expected to show much change until some of the automobile companies release orders for steel for new models, which have not yet been placed on a production basis. Bar mills still have fair backlogs. Some of the plate mills show a gain in deliveries. Inquiry in the structural field is rather light. Two inquiries have come from Toledo for sheet steel piling, one for 400 tons for the Maumee River bridge and one for 900 tons for the New York Central Railroad docks. Present prices will probably continue through the fourth quarter. A local mill is quoting steel bars rather freely at 1.90c., Cleveland, while other producers are naming 1.95c. Plates and shapes are firm at 1.95c., Pittsburgh.

Sheets.—Specifications in the automotive industry took a little spurt the past week and some business in auto body sheets are placed in the Michigan territory for the fourth quarter at the ruling 4.10c. Pittsburgh price, which several mills have named for that delivery. Some producers have reestablished prices at 2.85c., Pittsburgh, for black, 2.35c. for light gage blue annealed, 4.20c. for metal furniture sheets and 3.90c. for vitreous enameling sheets for the last quarter. Demand in this territory is rather light. Most of the mills still have good backlogs except in auto body sheets. Regular prices appear to be well maintained for current orders.

Strip Steel.—Several mills have reestablished hot-rolled strip prices for the fourth quarter at the present basis of 1.90c., Pittsburgh, for wide and 2c. for narrow material. As mills withstood sharp resistance to these prices for the third quarter from the automotive industry, they do not expect to have difficulty in maintaining them in the final quarter. Some of the mills still have good backlogs. One sizable order placed by an Ohio consumer during the week went to a Chicago mill which could make good deliveries. A real test on cold-rolled strip prices will come when consumers contract for the coming quarter. Mills recently advanced their price to 2.85c., Cleveland and Pittsburgh,

and are naming this for the last quarter. However, shipments this month will be against old 2.75c. contracts. Specifications are light and some of the mills need orders.

Iron Ore.—Iron ore shipments by water during August broke all previous monthly records. The total movement was 10,806,967 tons, compared with a previous record of 10,709,260 tons in August, 1926. The movement until Sept. 1 also broke previous records, having been 43,717,787 tons, compared with 32,517,693 tons during the corresponding period last year, or a gain of 31.4 per cent. The previous record up to Sept. 1 was 39,334,-264 tons in 1918.

Wire Products. — Manufacturers' wire is still in fair demand. While 2.40c. a lb., Cleveland, is the ruling price quoted to local jobbers and for outside shipment, some of the mills are getting 2.50c. locally. Nails are in light demand and weak. They are being sold at $2.50 a keg by one Central Western jobber.

Semi-Finished Steel.—Specifications against contracts for sheet bars, billets and slabs are lighter than recently. A local producer is still operating all of its open-hearth furnaces, but is catching up on deliveries and can now make shipments in about 10 days. The market is devoid of inquiry.

Warehouse Business.—The volume is holding up well for this season of the year. One jobber reports a gain and another a slight loss as compared with July. Prices are firm.

Coke.—The market is not active. There is a moderate demand for small lots of the better grades of Connellsville foundry coke, which are bringing $4.85 a net ton. Some business in Ohio by-product foundry coke for September shipment has been placed since the reestablishment of the $8.25, Painesville, price.

Old Material.—Little of interest occurred in the market in the past week. While scrap is coming out more freely than recently, no apparent weakness has developed. Local mills continue to take shipments in about the same rate as during the past few weeks, but are making no additional purchases. Dealers are paying $17 for selected No. 1 heavy melting steel for delivery to one local mill and $15.50 for lighter material for another mill. Up to $15 is being paid for No. 2 grade, which is slightly firmer. Short shoveling turnings are not as firm as recently. Dealers are buying blast furnace scrap against outstanding orders at quoted prices.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:		
No. 1 heavy melting steel	$15.25 to	$15.50
No. 2 heavy melting steel	14.50 to	15.00
Compressed sheet steel	15.50 to	16.00
Light bundled sheet stampings	12.00 to	12.50
Drop forge flashings	13.00 to	13.25
Machine shop turnings	9.75 to	10.25
Short shoveling turnings	11.75 to	12.25
No. 1 railroad wrought	13.50 to	14.00
No. 2 railroad wrought	16.00 to	16.50
No. 1 busheling	13.25 to	13.75
Pipes and flues	9.00 to	9.50
Steel axle turnings	12.50 to	13.00
Acid Open-Hearth Grades:		
Low phos., forging crops	17.75 to	18.00
Low phos., billet, bloom and slab crops	18.50 to	18.75
Low phos., sheet bar crops	18.00 to	18.50
Low phos., plate scrap	18.00 to	18.50
Blast Furnace Grades:		
Cast iron borings	10.50 to	10.75
Mixed borings and short turnings	10.50 to	10.75
No. 2 busheling	10.50 to	10.75
Cupola Grades:		
No. 1 cast	17.50 to	18.00
Railroad grate bars	11.00 to	12.00
Stove plate	12.00 to	12.50
Rails under 3 ft.	18.50 to	19.00
Miscellaneous:		
Railroad malleable	18.00 to	18.50
Rails for rolling	16.25 to	16.50

Railroad Equipment

Norfolk & Western to Buy 1000 Hopper Cars

WHILE railroads are showing some interest in buying new equipment, as evidenced by purchases of 525 cars in the past week, inquiries have been light. The Central of New Jersey has ordered 200 70-ton steel gondolas and the New York Board of Transportation 300 steel subway cars. The Fruit Growers Express has contracted for 500 underframes. The Norfolk & Western is in the market for 1000 hopper cars. The New York Central has placed an order for 35 oil-electric switching locomotives. Details of the past week's business follow:

New York Central has ordered 35 oil-electric switching locomotives from American Locomotive Co.

Virginia Iron, Coal & Coke Co. has placed an order for two small electric locomotives with Baldwin Locomotive Works.

Philadelphia & Reading Coal & Iron Co. has bought three electric locomotives from Baldwin Locomotive Works.

Humble Oil & Refining Co. has contracted for a small steam locomotive with Baldwin Locomotive Works.

Central Railroad of New Jersey has ordered 200 70-ton steel gondolas from Bethlehem Steel Co.

New York City Board of Transportation has ordered 300 steel subway cars from American Car & Foundry Co.

Sterling Coal Co. has purchased 200 mine cars from the Bethlehem Steel Co.

Bessemer & Lake Erie has ordered 25 gondolas from Greenville Steel Car Co.

Great Northern is inquiring for two electric locomotives.

American Rolling Mill Co. has ordered two 300-hp. oil-electric locomotives from American Locomotive Co., Ingersoll-Rand Co. and General Electric Co.

Western Electric Co. has bought a 300-hp. oil-electric switching locomotive from Westinghouse Electric & Mfg. Co.

Birmingham Southern is expected to buy 25 50-ton all-steel box cars.

New York, New Haven & Hartford is asking for bids on five oil-electric rail motor cars.

Winston Brothers, Cincinnati, has ordered 150 dump cars from Western Wheeled Scraper Co.

Norfolk & Western will buy 1000 hopper cars.

Fruit Growers Express has ordered 500 underframes from Ryan Car Co.

St. Louis-San Francisco may come into the market for a number of 2-8-4 locomotives.

Missouri Pacific is figuring on buying 25 engines of either the 4-8-4 or the 2-8-4 type.

Chicago, Burlington & Quincy is considering the purchase of 10 engines.

Reinforcing Steel

Past Week Was Quietest of Year —Awards of 1700 Tons

WITH awards totaling only 1700 tons and with no fresh inquiries of consequence appearing, the past week was the quietest of the year. A warehouse at Hartford, Conn., which will require 650 tons, was the largest letting. Awards follow:

HARTFORD, CONN., 650 tons, warehouse, to Truscon Steel Co.

FALL RIVER, MASS., 125 tons, State bridge, to Truscon Steel Co.

CAMBRIDGE, MASS., 200 tons, school, to Concrete Steel Co.

BATTLE CREEK, MICH., 450 tons, sanitarium, to Kalman Steel Co.

GREELEY, COLO., tonnage not stated, two miles of 27-in. reinforced concrete pipe, to an unnamed bidder.

DENVER, tonnage not given, three miles of 66-in. reinforced concrete pipe, to an unnamed bidder.

ELLENSBURG, WASH., 143 tons, canal project, to unnamed bidder.

LONGVIEW, WASH., 125 tons, gates for Long Bell Lumber Co., to unnamed bidder.

Larger Carnegie Beams

The Carnegie Steel Co. has announced new 33 and 36-in. Carnegie beam and girder sections, which will be available for the trade some time after Oct. 1. The sections will be rolled at the company's Homestead works. Heretofore Carnegie beams have only been made in sections up to 30 in. The new 33 in. sections will range from 125 to 260 lb. per lin. ft., and the 36 in. from 147 to 300 lb. per lin. ft.

Foundry Meeting at St. Louis

The St. Louis District Foundrymen's Club will be addressed at its monthly meeting in St. Louis on the evening of Sept. 13 by Dr. Richard Moldenke, Watchung, N. J. Invitations have been issued to foundrymen in neighboring cities.

MacFarland & Little, Philadelphia, steel mill agents for tool steels, drawn steel, drill rods, etc., have moved their offices and warehouse from Arch Street to 1121 Frankford Avenue. William J. MacFarland and Joseph V. Little have been partners in this firm for 47 years. For the past 33 years they have been exclusive agents in the Philadelphia district for the Firth-Sterling Steel Co., McKeesport, Pa.

Pacific Coast

Structural Steel Awards Nearly 10,000 Tons Including 7000 Tons for Portland, Ore., Bridge

SAN FRANCISCO, Aug. 31 (*By Air Mail*).—The structural steel market was active during the past week on the Pacific Coast, and close to 10,000 tons was placed. Demand otherwise continues to reflect the usual mid-summer lull, the majority of inquiries and sales being confined to relatively small lots. Plate fabricators are keenly interested in the outcome of the Everett, Wash., pipe line project, involving 10,000 tons of plates. Alternate bids were taken on wood and reinforced concrete pipe. Bids have been opened on a quantity of track material, including 550 tons of girder rails for the Municipal Railroad, San Francisco. The price structure continues on an even keel, with little or no shading.

Pig Iron.—Movement of foundry pig iron is in small lots. No change in prices has occurred.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Only two awards involving more than 100 tons of reinforcing steel bars were reported this week. Both went to unnamed interests. Pending business is not heavy. An award is expected next week on 2300 tons for a wharf in Oakland. Out-of-stock prices continue on a fairly firm basis of 2.30c., base, on carload lots and 2.60c. on less than carload lots. In the Los Angeles district prices $2 a ton higher prevail. Merchant bar steel continues to move in small lots only and no large inquiries are current. On this class of material, 2.35c., c.i.f., is general.

Plates.—The Western Pipe & Steel Co. was low bidder on 10,000 tons for a pipe line at Everett, Wash. Action on 3000 tons for a pipe line at Bremerton, Wash., has again been postponed owing to financing delays. Prices appear to be firm at 2.35c., c.i.f. Coast ports.

Shapes. — Structural steel shape bookings were the heaviest since early in March, totaling nearly 10,000 tons. The outstanding award was 7000 tons for the St. John's Bridge at Portland, Ore., 5000 tons having been placed with the Wallace Bridge & Structural Steel Co. and 2000 tons with the United States Steel Products Co. German interests were awarded 950 tons of sheet piling for the Akli Avenue sea wall in Seattle at a price reported to be $45 a ton, c.i.f., duty paid. The Consolidated Steel Corporation secured 350 tons for a factory for the Willard Storage Battery Co., Los Angeles, and 200 tons for a factory in El Segundo, Cal. No award has yet been made on the West Garfield Street bridge, Seattle, involving 400 tons. New inquiries include 325 tons for an addition to the American Can Co. plant, San Francisco, 450 tons for a power house in San Francisco for the Pacific Gas & Electric Co., and 405 tons for a bridge over the Trinity River for the State. Prices continue on a firm basis at 2.35c., c.i.f.

Cast Iron Pipe.—S. A. Moceri took 515 tons of 6 to 12-in. Class B pipe for the improvement of McKinley Hill district, Tacoma. The United States Pipe & Foundry Co. secured 303 tons of 10-in. Class B pipe for Coquille, Ore., and the Pacific States Cast Iron Pipe Co. took 192 tons of 2-in. Class B pipe for Los Angeles. The American Cast Iron Pipe Co. was low bidder on 377 tons of 6 to 10-in. Class B pipe for Anaheim, Cal., and the R. E. Hazard Contracting Co. was low bidder on 112 tons of 4 to 8-in. Class B pipe for the improvement of Estelle Street, San Diego.

Track Material.—The United States Steel Products Co. was low bidder on 82 special layouts, 21,000 tie plates, 30 kegs of track bolts, 130 kegs of track spikes, 13,000 brace tie plates and 550 tons of 98 to 129-lb. girder rails. Its bid was $60.75 on 450 tons of 105-lb. girder rails.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅜-in. and over	3.15c.
Small angles, under ⅜-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Sales Larger, Mostly for Shipment to North—Open-Hearth Operations at Low Point of Year

BIRMINGHAM, Sept. 3.—A good volume of new pig iron tonnage was booked last week for September delivery, this coming from melters who have been buying from month to month and close to current needs. Additional buying will develop during the next week or so, as a number of small melters are still not covered for September. There has been practically no activity in fourth quarter iron to date. The general run of small-lot orders continues at a fair rate. Yard stocks of Birmingham furnaces were reduced in August for the second consecutive month. All three merchant producers reported shipments larger than production, and the August decrease in stocks was greater than in July. This was largely due to shipments outside of the South. A substantial tonnage is said to have been booked in competitive markets at price concessions from $1 to $2 under Southern market quotations. Iron in the Southern market continues at $14.50 base. Within the past week there were no changes in furnace operations, but during August three furnaces were blown out, two of them by merchant foundry producers. Fourteen furnaces are now in blast. The Republic Iron & Steel Co. is relining a stack blown out the middle of August and expects to have it back in operation the early part of October.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Demand for finished products, other than rails, continues undiminished, and operations remain at a high point. Quotations have not been changed in the past several weeks, but concessions are being made when the business justifies. On the whole, price conditions are as stable as in other markets. Fabricators of structural steel and reinforcing steel are beginning to feel the recession in building demands. Two of the larger structural steel fabricators still have some unfilled tonnage, and one, in particular, reports orders on hand for 60 days. New business is light and a curtailment in operations has started. The Ingalls Iron Works secured 220 tons of structural steel for conveyor and bins from the Tennessee Copper Co. at Copperhill, Tenn. Bar fabricators report only a general run of small orders. Open-hearth operations are at the lowest point of the year, owing to the reduction that took place at Ensley works of the Tennessee company when the rail mill was closed. Three of nine are being operated at Ensley, but seven of the eight at the Fairfield works are active. The Gulf States Steel Co. is operating all six at Alabama City.

Cast Iron Pipe.—Pressure pipe manufacturers report a general quietness, with present business largely made up of small orders. Prices remain at $37 to $38 a net ton, Birmingham, for 6-in. and larger diameters.

Coke.—New tonnage in foundry coke is restricted, as most of the third quarter tonnage is under contract. Shipments continue satisfactory. Prices are still $5 for both spot and contract.

Old Material.—Steel grades are active, but cast iron grades are moving

slowly. Prices are the same as for the past several weeks.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.50
Tramcar wheels	13.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Large Production of By-Product Coke

Total output of by-product coke for the 31 days of July amounted to 4,613,723 net tons, an average of 148,830 tons a day, according to the Bureau of Mines. In comparison with the June daily average of 150,319 tons, this was a decrease of 1 per cent, but in comparison with July of last year it was an increase of 18 per cent, the respective totals for these months being 4,509,564 tons and 3,911,082 tons.

There were 86 by-product plants in operation during July, and they produced 94 per cent of their capacity.

Total output of beehive coke is estimated at 600,200 tons, a decrease of 0.4 per cent when compared with 602,400 tons, the revised figure for the preceding month, but an increase of 121 per cent over July, 1928. The combined output of by-product and beehive coke was 5,213,923 tons, 2 per cent above June.

In seven months, production of by-product coke has reached 31,307,452 tons, by far the highest total on record. This is 14 per cent ahead of last year. Except for May, the July total output is the greatest ever made in one month.

E. J. Schwabach Co. and I. J. Louis & Co., commodity houses, both of 60 Beaver Street, New York, merged Aug. 31. Henceforth business will be transacted under the name of the former company. The firm holds memberships in all the principal commodity exchanges.

St. Louis

Tone Is Firmer in Pig Iron—Scrap Scarce and Strong and Prices Are Advancing

ST. LOUIS, Sept. 3—While current sales of pig iron are not in large volume, the market has a firmer tone. The situation has been cleared by the recent heavy sales by Southern blast furnaces, which reduced their stock piles and buttressed their backlogs. Throughout this district the remainder of 1929 requirements have been pretty well covered. Advantage has been taken by melters of the competition between Northern and Southern furnaces to lay up liberal stocks at low prices. The extreme low figures of the past several weeks have disappeared, and now the lowest which can be done on No. 2 Southern hereabouts is $13.25 to $13.50, furnace. Sales reported in the past week total about 6000 tons, of which the St. Louis Gas & Coke Co. took 2400 tons, the rest having been divided between Alabama and Chicago district makers. August shipments exceeded those of July, also the August, 1928, total.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite city	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—Small jobs, aggregating a fair tonnage, are reported by fabricators and concrete bar interests, but individual lettings are not of large size. Numerous projects are pending. The largest transaction was 450 tons of reinforcing concrete bars for the McMillan Hospital, placed with the Laclede Steel Co. Warehousemen report business satisfactory. Galvanized sheets have improved further, and the movement of tin plate is normal for the season. Prices are steady.

Coke.—Preliminary reports of by-product interests in this district indicate total August shipments in excess of those in the same month last year. Demand for foundry coke holds up well, but purchasing is on an immediate requirement basis. Contracting by industrial users is in fair volume, but domestic sizes continue slow.

Old Material.—All grades of scrap iron and steel are strong, with heavy melting steel and steel specialties leading the demand. Mills are in need of material, and, while reluctant to pay the prices asked, have been forced recently to meet dealers' terms on some items. Railroad offerings have increased, but are still bringing top prices, and bidding for them is spirited. Inquiries for a number of grades have been received here from other centers, notably Chicago. Country mixed scrap is scarce, and has been advanced $1 per ton. Malleable was marked up another 50c., and fractional advances were recorded on several other items. The following railroad lists appeared: Mobile & Ohio, 29 cars; Pennsylvania, 69,945 tons; Missouri Pacific, 170 cars; Big Four, 1150 tons; Missouri-Kansas-Texas, 3000 tons; Cotton Belt, 15 cars; Rock Island, 10 cars; Belt Railway, 11 cars, and New Orleans Great Northern, 65 tons.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.75 to $15.25
No. 2 heavy melting or shoveling steel	14.50 to 15.00
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	17.00 to 17.50
Railroad springs	19.50 to 20.00
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	15.00 to 15.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	17.25 to 17.75
Machine shop turnings	7.00 to 7.50
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	12.50 to 13.00
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Cincinnati

Pig Iron Demand Slows Up—Alabama Iron Sold at $13 to $14, Birmingham

CINCINNATI, Sept. 3—District consumers of pig iron continue reluctant to enter the market for sizable quantities of iron. Sales last week declined sharply from the level of the preceding week. Most furnaces are marking time, taking small orders and awaiting the renewed interest of buyers, when fourth quarter requirements force them into the market. Total sales last week were about 4000 tons, compared with 6000 the preceding week. Of this tonnage, 1200 tons, in small lots, was placed with Southern furnaces at about $14, base, Birmingham. A Tennessee furnace which heretofore had accepted orders on a basis of $13.50, Birmingham, refused a fair tonnage at this quotation, and notified its selling agent that no more iron would be sold at less than $14, base, Birmingham, for delivery into this district. Heretofore, Southern furnaces have maintained quotations

at $14 for Cincinnati delivery, although tonnage orders and business outside the metropolitan area were taken at $13.50 and in a few instances at $13. Except for an inquiry from a Louisville, Ky., consumer for 600 tons of Southern foundry, there is no pending business before the trade.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Coke.—With most foundries covered for their fuel needs for the remainder of this quarter and in some instances through the fourth, no new business, except for occasional spot shipments, has been reported. Specifications for by-product foundry coke have tapered still more during the last week, although district foundries are reported to be busy. Prices on by-product foundry grades continue firm at about $10.05, delivered in Cincinnati.

Old Material. — Dealers are still competing strongly for heavy melting steel and other good grades of old material, but mills are not willing to pay current prices. New business is quiet. As old contracts end, mills renew quietly for short periods.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.25 to $14.75
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.75
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.25 to 14.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Finished Material.—The return of several automobile manufacturers to the district sheet market, combined with the well-sustained demand from users of specialty sheets, brought new bookings of district sheet mills to a point above capacity last week. Backlogs, which had been cut into materially during the last few weeks, again were increased. During the early part of the week an improvement in deliveries had been noticed, but the entry of automotive manufacturers, most of whom placed rush orders, has again complicated the situation. Thus, promises of four to six weeks on blue annealed sheets and three to four weeks on black sheets are about the earliest shipments reported, while full pickled and other special grades are still well extended. Prices in all grades, except galvanized sheets, are firm and no changes for the fourth quarter are anticipated.

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.

4-in.	34.00

Boston

Pig Iron Sales for Week Exceed 10,000 Tons — Slight Easing in Scrap Prices

BOSTON, Sept. 3.—Sales of pig iron the past week exceeded 10,000 tons, about 80 per cent of which was Southern and Mystic iron. No lots larger than 500 tons were sold to any one consumer, and practically all were for fourth quarter delivery, an indication that the small and medium-sized foundries have started an active buying movement for final 1929 requirements. A Massachusetts machinery manufacturer has yet to cover on 2000 to 3000 tons. Little change is noted in prices. While most Buffalo stacks are openly quoting $18 a ton, base, furnace, that price has been shaded, and it is still possible to obtain iron made in that district at $17, base furnace. Most of the Southern iron sold the past week was at $14.50 a ton, base furnace, but at least one furnace went to $14 rather than lose the order. Sales by the Mystic Iron Works were generally at $20 to $21.75 a ton, furnace, for No. 2X and No. 1X, depending on the freight rate. Some Indian iron has been bought at $21.75 to $22 a ton, on dock here, duty paid.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.28 to $22.28
†Buffalo, sil. 2.25 to 2.75	21.78 to 22.78
*Buffalo, sil. 1.75 to 2.25	21.91 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.41 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	23.61
*Ala., sil. 2.25 to 2.75	24.11
†Ala., sil. 1.75 to 2.25	19.75 to 20.25
†Ala., sil. 2.25 to 2.75	20.25 to 20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Warehouse Business. — Consumption of warehouse products, which showed some increase late in August, is expected to improve further during the remaining four months of 1929 owing to the activity of metal-working shops. That competition for business is keen among warehouses handling domestic steels and those offering imported material is evidenced by the growing willingness to shade regular list prices. Concessions vary according to the size and desirability of the order.

Shapes and Plates. — Despite reports from other sections of the country of a tapering off in business, local mill representatives say New England bookings are holding up well and running well ahead of last year. Deliveries on plates, while better than they were a month or two ago, are still delayed. It is estimated that consumption of standard shapes in New England the last quarter of 1929 will nearly double that for the corresponding period last year. For attractive tonnages, 1.90c. a lb. can still be done, but 1.95c. is the general asking price. A local fabricator has closed on 3000 tons of steel for a Boston district job. Because the work was placed without competition details are withheld.

Cast Iron Pipe.—Prospective pipe business dropped off materially the past week. Braintree, Mass., is asking bids on a round tonnage of 6-in. pipe, and Southwick, Mass., on six miles of 8 and 10-in. stock. Because of the sold-up condition of foundries on small pipe, prices are well maintained despite the dearth of prospective business, yet attractive tonnages of large pipe unquestionably can be had at concessions. Prices quoted openly on domestic pipe are: 4-in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.10. A $3 differental is asked on Class A and gas pipe.

Imports and Exports. — Arrivals of foreign iron at this port during the first half of August were 973 tons of Indian and 500 tons of Dutch, a total of 1473 tons, which compares with 548 tons during the first half of July, this year, and 695 tons in the first half of August, last year. Arrivals of ore the first half of August were 6750 tons of Bona and 11,380 tons of Newfoundland, a total of 18,130 tons, as compared with 16,510 tons the first half of July, this year, and 12,583 tons the first half of August, 1928. Scrap exported to Danzig the first half of August, this year, amounted to 3180 tons.

Coke. — The by-product foundry coke situation has not changed. Specifications against last half contracts exceed expectations. The price is holding firmly at $11 a ton, delivered within a $3.10 freight rate zone.

Old Material.—Pre-holiday buying of scrap fell off a little, and the market for No. 1 heavy melting steel and forge flashings was a little easier, while $10 a ton on cars, shipping point, was the general market for long bundled skeleton. Shading of prices, however, is reported as temporary, and will, it is believed, be followed by a resumption of buying at full prices owing to the continued scarcity of most material wanted by Pennsylvania mills. Brokers say they have a considerable tonnage yet to cover. New England foundries have shown more interest in pig iron than in scrap. The market for No. 1 machinery cast is firm at $15 to $15.50 a ton, delivered, but $14 to $14.50 a ton for textile cast is maintained with difficulty owing to increasing supplies. July scrapping of textile machinery was the heaviest for any one month since records have been maintained, and a lot of machinery also was discarded in August.

Buying prices per gross ton, fo.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.00 to $12.50
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.00
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	7.00 to 7.50
Cast iron borings (steel works and rolling mill)	6.50 to 6.75
Bundled skeleton, long	10.00 to 10.50
Forge flashings	10.25 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.25
Shafting	14.00 to 14.75
Steel car axles	18.00 to 18.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	9.75 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.50
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.00 to 18.50

Buffalo

Pig Iron Inquiries Total 10,000 to 12,000 Tons — Steel Mills Operating Well — Scrap Steady and Firm

BUFFALO, Sept. 3.—Producers are interested in an aggregate of 10,000 to 12,000 tons of pig iron inquiry from various sources, principally from Eastern points. Fewer inquiries are being received from the district, most of the business here being closed through personal solicitation before reaching the inquiry stage. An inquiry from New Jersey is for 1000 to 2000 tons of foundry, and several lots of 400 or 500 tons of foundry and malleable are pending. A New England basic user is putting out feelers for a considerable tonnage, but the exact amount is not known. Producers here are adhering to a $19.50 base for the district.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Finished Iron and Steel.—All mills are maintaining high production schedules. The Donner Steel Co. was temporarily operating five open-hearths, but has now increased to seven. Little new business was placed with structural fabricators during the week, but several jobs are in prospect. Tonnage is being figured now for the new State prison at Attica, N. Y., and for a marine aerodrome for the city of Buffalo. A local maker took 180 tons of reinforcing mesh for State highways and 80 tons for a highway job at Ludlowville, N. Y.

Old Material.—The market is holding well. Demand for shipment on the last large tonnage of No. 1 heavy melting steel sold here has increased, making conditions a little more difficult for the dealers, who are paying $17.75 for material for shipment on this order. A few sales of No. 1 machinery cast scrap have been made at $16. Some short steel rails, railroad knuckles and couplers and rolled steel wheels have been sold at $19.50. Sales of short shoveling turnings have been made at $12.50 to $13, and sales of mixed borings and turnings and of cast iron borings at $12 to $12.25. Strength of the outside markets is making it difficult to pick up tonnages in this district and most of the dealers are short on all material sold during the past month. Dealers are expecting a sizable buying movement soon. Most of the scrap immediately east of Rochester is going to Pittsburgh and Youngstown districts. A large consumer of scrap in Buffalo continues to receive two boat loads of material from Detroit each week, and is maintaining its stockpile despite heavy operation.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.50 to $18.00
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	9.00 to 9.50
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	19.50 to 19.75
Coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades:	
Short shov. steel turnings	12.50 to 13.00
Blast Furnace Grades:	
Short mixed borings and turnings	11.50 to 12.25
Cast iron borings	11.50 to 12.25
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	16.00 to 17.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Canada

General Outlook Holds Much Promise

TORONTO, ONT., Sept. 3.—The general outlook in the iron and steel industry of Canada continues to hold much promise for the last quarter of this year. The production of pig iron and steel continues at a high rate. While July production figures were at about the highest point this year, the output during August was sustained.

It has just been announced that the Algoma Steel Corporation, Sault Ste. Marie, Ont., has received a new rail order from the Canadian Pacific Railway. While the actual tonnage has not been given out, it was stated that the order will keep the rail mill going for a month. This order, together with backlogs, will supply enough business for the rail mill until about Dec. 1.

Pig Iron.—Slow but steady improvement features the general trend of pig iron business. New orders are mostly in small tonnages, but the total volume is fairly good. Several orders during the week called for lots up to 500 tons, and others of like size are said to be pending. Some melters are showing interest in fourth quarter needs. Local blast furnace representatives look for considerable future

buying when books are opened for the last quarter about Sept. 15. Pig iron prices are unchanged.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60

Delivered Montreal

No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50

Imported Iron, Montreal Warehouse

Summerlee	$33.50
Carron	33.00

Structural Steel.—While new business is slow, the prospective demand for structural steel continues large. Bridge construction work in Ontario, Quebec and British Columbia, already announced, will call for large tonnages, and on some of this work bids are now being received.

Old Material.—Steadily improving demand features business in this market. Sales are generally in better tonnage than at any time in the past two months, and consumers are showing more interest in their present and future scrap needs. Small contracts are being placed for delivery during the next month or six weeks, and inquiries are coming out for supplies to be delivered to the end of the year. Steel scrap developed a stronger demand during the week, with a few large tonnage orders reported in the Toronto and Hamilton districts. Iron scrap sales, however, continue to be the prominent feature of the market.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.	$10.00	$8.50
Rails, scrap	11.00	9.00

Malleable scrap	14.00	....

Chicago - Green Bay, Wis., Rate "Not Unreasonable"

WASHINGTON, Sept. 3.—The rate of 20.5c. per 100 lb. on iron and steel articles from Chicago (and points taking the same rate) to Green Bay, Wis., is not unreasonable or otherwise unlawful, according to a proposed report of Examiner Williams A. Maidens, made public today. The examiner said, however, that the rate is not in harmony with the rate in effect from the same territory to Milwaukee.

The Chicago-Milwaukee rate is 9.5c. and was declared to be "very much depressed." The complaint against the Chicago-Green Bay rate was made by the Green Bay Association of Commerce on behalf of the Northwest Engineering Corporation and other iron and steel users.

Youngstown

Decline in Automobile Curtails Strip Mill Operations—One Sheet Producer Offering Immediate Shipments

YOUNGSTOWN, Sept. 3.—The steel industry in the Valleys faces a month of uncertainty. Incoming specifications and orders will be watched with more interest than they have been at any time this year. Local executives see nothing alarming in prospect, as steel demand may ordinarily be expected to grow stronger in September and October. But the very heavy consumption of steel in the first eight months of the year has led some to believe that the usual autumn improvement will not develop marked proportions. Such a view is undoubtedly based on the uncertainty in the automobile industry. Valley steel companies are dependent on this industry for an important share of their prosperity. Local steel consuming companies are each year taking larger proportions of the output of Youngstown mills, but the industry here must still look to outside sources of outlet in disposing of that percentage of production which enables the mills to operate at a high and consequently profitable rate.

The large output of pipe in the Valleys is nearly all shipped to distant points, and at present the prospects for this product are unusually good. Local mills have taken numerous small feeder lines for many of the larger pipe line projects placed this year. These orders have permitted comparatively high and well diversified operations in recent weeks. Local mills are taking advantage of water shipment on this material, and large tonnages of pipe are moving by rail to Ambridge and Woodlawn, Pa., where it is transferred to barge and shipped to Southern points.

Sheet backlogs are gradually being used up, and one large producer has just notified the trade that it is able to make immediate shipments of all the common finishes. Others are better supplied with commitments and will be able to maintain fair operations for the greater part of the month on present tonnage. Sheet operations last week averaged about 90 per cent of capacity, but the holiday this week, coupled with slightly lower rolling schedules, will reduce this percentage about five points. Strip operations are at not more than 75 per cent of capacity and further curtailment is probable before the expected increase in automobile requirements calls for larger tonnages.

Recent price weakness in sheets has apparently been checked. On galvanized, local mills are occasionally forced to go to 3.50c., Pittsburgh, but the usual quotation is 3.60c. and some business is being taken at that figure. On black sheets, the price is steady at 2.85c., Pittsburgh, and blue annealed material is holding at 2.20c. for the No. 10 gage base and 2.35c. for the No. 13. On wide strips, the market is fairly well represented by a 2.10c., quotation. Both hot and cold-rolled strip are established at recent prices of 1.90c. and 2c., Pittsburgh, on the hot-rolled and 2.75c., to 2.85c. on the cold-rolled.

Fourth quarter pig iron buying has not yet begun and only small and scattered inquiry for this period has developed. Consumers of basic will soon have to come into the market, but purchases are likely to be delayed as long as possible in order to figure out the turn of the market. Prices seem to be unusually firm at $18.50, Valley, for foundry and basic iron and $19 for malleable and Bessemer, and no advance is anticipated for fourth quarter.

The scrap market is holding its recent strength. Sales of No. 1 heavy melting steel have been made in the last week at $19. Hydraulic compressed sheets range from $18 to $18.50, but recent sales have been made at the higher figure. Specialties are strong and also the lighter grades of steel, such as machine shop turnings and short shoveling steel turnings.

Rome Iron Mills Leased

The Rome Iron Mills, Inc., announce that it has leased its plant at Rome, N. Y., to the Wrought Iron Co. of America. The mill organization has been retained and the Wrought Iron Co. of America intends to continue making the same grades of iron as in the past.

The Wrought Iron Co. of America was formed by a merger of the Lebanon Iron Co., Lebanon, Pa., and the Scranton Bolt & Nut Co., Scranton, Pa.

Ohio Steel Foundry Co., Lima, Ohio, has placed a contract for the erection of a foundry building, 100 x 200 ft., at its Springfield plant. This will be equipped with an electric furnace and modern foundry equipment and will be used exclusively for the manufacture of Fahrite heat resisting alloy castings and for the company's other alloy products. These alloy castings have been produced for the past seven years in the company's electric steel foundry at Springfield. With the erection of the new foundry the manufacture of alloy castings will be segregated in a separate building and under separate supervision.

September in automobiles promises to show a total output fully equal to and probably higher than that for August, says *Automotive Industries.*

CARNEGIE LIBRARY OF ATLANTA

Non-Ferrous Metal Markets

One Producer Raises Copper Price to 18¼c.—Sales Heavy —Lead Active—Tin Quiet

NEW YORK, Sept. 3.

Copper.—Buying turned sharply upward in the past week and reached a total of about 50,000 tons, most of which consisted of domestic sales. However, foreign bookings during August were far ahead of those in July. As the buying movement gained momentum, consumers who had been holding off for several months came into the market to protect themselves against the possible results of a situation favoring producers. The Labor Day holiday only halted activities temporarily, for this morning foreign orders alone amounted to 3500 tons. With order books well augmented, the leading producer today announced an advance of ¼c. a lb. to 18.25c., delivered in the Connecticut Valley, for electrolytic copper. Other sellers have not yet followed this lead and are continuing to quote 18c. However, they declare that they have booked about all of the tonnage they care to take at 18c. and today were refusing some business at that figure. This action naturally indicates that within a day or two the market probably will be 18.25c. Some producers are inclined to look upon the advance as a mistake, stating that it would be much better to encourage consumers to buy freely by keeping prices at the level which has prevailed for the past few months. Lake copper is moving in liberal volume and the price ranges from 18c. to 18.12½c., delivered. In most cases, bookings have been for August and September delivery.

Copper Averages.—The average price of Lake copper for August, based on daily quotations in THE IRON AGE, is 18.12½c., delivered New York. The average price of electrolytic copper is 17.75c., refinery, or 18c., delivered in the Connecticut Valley.

Tin.—The past week has been one of the quietest of the year. Sales of about 750 tons were almost exclusively for delivery in the next two months. Despite the dullness, the market has a firm undertone and prices held well until today, when spot Straits tin dropped to 45.50c., New York. The decline reflected the weakness of the situation at London, where prices were lower, with spot standard quoted at £204 10s., future standard at £208 10s., and spot

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Sept. 3	Aug. 31	Aug. 30	Aug. 29	Aug. 28

- Lead, bar ..... 9.75c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.75c.
- Babbitt metal, high grade ..... 55.50c.
- Solder, ½ and ½ ..... 31.75c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.25c.
Copper, hvy. and wire	14.50c.	15.75c.
Copper, light and bottoms	12.50c.	13.75c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

Straits at £208 10s. The break in London was caused by the publication of the monthly figures of the National Metal Exchange, which showed an increase in August of 2611 tons in the visible supply. The Singapore price today was £212 15s.

Lead.—Bookings in the past seven days were equal to those of the best previous week this year. Consumers in general are manifesting interest in covering their requirements for September and October. The volume of inquiries indicates that buying should be well sustained in the immediate future. Despite the strength of the market, producers are not attempting to push up prices and the leading interest in the West is quoting 6.55c., St. Louis. The largest producer is adhering strictly to 6.75c., New York, as its contract price.

Zinc.—The market is extremely weak, with consumers buying only in small quantities. Inquiries are of moderate volume, but producers do not anticipate an appreciable improvement in bookings during the coming week. Prime Western zinc is selling at 6.80c., East St. Louis.

Antimony.—Although Chinese metal is quoted at 9c. a lb., New York, duty paid, distress lots out of warehouses have been sold at as low as 8.62½c. In some cases 8.75c. is being asked, but no business is being done at that figure. The easing of the political situation in the Far East has been partially responsible for the weakness which has appeared in the local market.

Nickel.—Ingot nickel is quoted in wholesale lots at 35c. a lb., shot nickel at 36c. and cathode electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is being quoted at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

Sept. 3.—Interest in non-ferrous metals continues to expand and sales for the week showed considerable improvement. Shipments against past obligation were in larger volume.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 47.25c.; lead, 6.70c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.85c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

Non-Industrial Projects Will Take Large Portion of Past Week's Awards and Inquiries

STRUCTURAL steel lettings, amounting to 26,000 tons, were slightly better than those of the previous week. Non-industrial projects will take almost one-half of the tonnage. Outstanding awards were 7000 tons for a highway bridge at Portland, Ore., and 3000 tons for an apartment house in New York.

Structures for non-industrial purposes also predominated the fresh inquiries which appeared during the week. Ten thousand tons will go into an addition to the *Chicago Tribune* Building and 3000 tons into an office building at Milwaukee for the Chicago & North Western Railroad. Awards follow:

SPRINGFIELD, VT., 175 tons, high school, to unnamed fabricator.

NASHUA, N. H., 100 tons, office building, to unnamed fabricator.

FALL RIVER, MASS., 100 tons, State bridge, to Boston Bridge Works, Inc.

BRANFORD, CONN., 100 tons, foundry, to Palmer Steel Co.

STAMFORD, CONN., 600 tons, First National Bank Building, to McClintic-Marshall Co.

NEW YORK, 1700 tons, Lenox Hill Hospital, to Harris Structural Steel Co.

NEW YORK, 1000 tons, Gordon Baking Co. building in Queens, to Levering & Garrigues Co.

NEW YORK, 800 tons, Fox Film building on West Fifty-sixth Street, to Hinkle Iron Co.

NEW YORK, 3000 tons, apartment building at Seventy-first Street and Park Avenue, to Hinkle Iron Co.

NEW YORK, 1600 tons, apartment building at Riverside Drive and Seventy-seventh Street, to Easton Structural Steel Co.

NEW YORK, 600 tons, apartment building on East Seventy-ninth Street, to Harris Structural Steel Co.

MINEOLA, N. Y., 700 tons, hangars at Roosevelt Field, to Jones & Laughlin Steel Corporation.

PHILADELPHIA & READING RAILROAD, 600 tons, car shops at Wayne, Pa., to McClintic-Marshall Co.

HARRISBURG, PA., 1300 tons, Hotel Harrisburger, to McClintic-Marshall Co.

STATE OF PENNSYLVANIA, 160 tons, Erie County highway bridge, to American Bridge Co.

CHICAGO, 110 tons, building for Cushman's Sons, Inc., to New City Iron Works, local.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 140 tons, highway bridge, to American Bridge Co.

READING RAILROAD, 360 tons, bridge at Saint Clair, Pa., to Bethlehem Steel Co.

COPPERHILL, TENN., 250 tons, Tennessee Copper Co. conveyor and bins, to Ingalls Iron Works, Birmingham.

FINDLAY, OHIO, 210 tons, office building for Ohio Oil Co., to Massillon Bridge & Structural Co.

MINNEAPOLIS, 1700 tons, addition to Foshay Tower, to Duffin Iron Co., Chicago.

WICHITA, KAN., 750 tons, tanks, awarded to a Joliet fabricator by Winkler Engineering Corporation.

PORTLAND, ORE., 7000 tons, St. John's bridge; 5000 tons to Wallace Bridge & Structural Steel Co. and 2000 tons to United States Steel Products Co.

SEATTLE, 950 tons, sheet piling, Alki Avenue sea wall, to German bidders.

VICTORIA, B. C., 350 tons, bridge over Capilano River, to Western Canada Structural Steel & Bridge Co.

TILLAMOOK, ORE., 105 tons, Nehalem River bridge, to unnamed bidder.

LOS ANGELES, 350 tons, factory for Willard Storage Battery Co., to Consolidated Steel Corporation.

EL SEGUNDO, CAL., 200 tons, factory on 114th Street, to Consolidated Steel Corporation.

PHOENIX, ARIZ., 600 tons, power house for Central Arizona Light & Power Co., to Allison Steel Co.

NIZHNI-NOVGOROD, RUSSIA, tonnage not stated, automobile plant for Ford Motor Co., to Austin Co., Cleveland.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

PROVIDENCE, R. I., 100 tons, United States Rubber Co. plant.

FAIRFAX FALLS, VT., 100 tons, State bridge.

NEW YORK, 1100 tons, Western Hotel.

NEW YORK CENTRAL RAILROAD, 1000 tons, work at Grand Central Terminal in New York.

BROOKLYN, 700 tons, public school No. 230.

ATTICA, N. Y., 300 tons, New York State prison.

PHILADELPHIA, 3000 tons, Market Street National Bank building.

KITCHENER, ONT., 500 tons, market building.

TORONTO, ONT., 1500 tons, technical school on Mount Pleasant Road.

PROVINCE OF QUEBEC, 500 tons, two bridges over Gatineau River at Hull and Wright for Provincial Government.

LOUISVILLE, KY., 2000 tons, office building; Holabird & Roche, architects.

CHICAGO, 10,000 tons, addition to *Chicago Tribune* plant.

INDIANA HARBOR, IND., 2400 tons, extension to Inland Steel Co. plant.

MILWAUKEE, 3000 tons, office building for Chicago & North Western.

DES MOINES, IOWA, 2400 tons, office building.

FARGO, N. D., 400 tons, highway bridge.

SPENCES BRIDGE, B. C., 2000 tons, bridge for Canadian Pacific Railroad over Nicola River.

SAN FRANCISCO, 325 tons, addition to American Can Co. plant; bids being taken.

SAN FRANCISCO, 450 tons, power house for Pacific Gas & Electric Co.; bids being taken.

SACRAMENTO, CAL., 405 tons, bridge over Trinity River, Humboldt County; bids Sept. 25.

Federal Screw Works to Acquire Cleveland Plant

Superior Screw & Bolt Mfg. Co., East 93d Street and Aetna Road, Cleveland, will be taken over by the Federal Screw Works, Detroit, as a result of negotiations which are reported to have been closed, although details are not yet available. The Superior company specializes in the manufacture of high carbon steel screws and bolts. Its officers are B. G. Tremaine, Jr., chairman; Norton T. Jones, president; C. L. Wedow, secretary, and A. E. Fox, treasurer.

PERSONAL

J. M. ROTH, chairman of the board of the Copperweld Steel Co., Glassport, Pa., has resigned after having served the company in various capacities since its founding. He is the inventor of the hot molten welding process patent on copper-welded wire and other products. He was instrumental in the founding of the company, and served as its president until 1926, when he became chairman of the board. He has been succeeded by HARRISON NESBIT, president Bank of Pittsburgh, who has been a director of the company for some time. FRANK R. FROST, president Superior Steel Corporation, Pittsburgh, has also been made a director of the Copperweld company.

—

OTIS L. DAVIS has joined the staff of the Brainard Steel Corporation, Warren, Ohio, in the capacity of sales engineer. Since graduating from the University of Iowa he has been with the Western Electric Co. and more recently with the Acme Steel Co., Chicago, as sales supervisor, developing special lines.

—

EDWIN W. ELY has been appointed chief of the Division of Simplified Practice, Department of Commerce. He had been acting chief of the division since the promotion of Ray M. Hudson to assistant director of the Bureau of Standards. Other promotions made include that of I. J. Fairchild to chief of trade standards and of Dr. A. S. McAllister to chief of the Division of Specifications.

—

THOMAS B. FRANK, treasurer Cincinnati Planer Co., Cincinnati, has been selected to head the New England Cost Conference to be held at Babson Park, Wellesley Hills, Mass., this week. He is a member of the board of directors of the National Association of Cost Accountants.

—

ADRIAN B. WEAVER has resigned from the Chicago sales force of Hickman, Williams & Co., pig iron brokers.

—

B. F. MOHR, assistant to the vice-president in charge of operations, Illinois Steel Co., Chicago, has returned from a two and one-half months' trip to Europe.

—

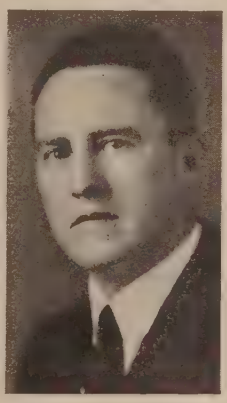
RALPH SCOTT, formerly sales manager of the Gardner-Denver Co., is en route to London, England, where he is to be stationed as one of the company's foreign branch managers. W. G. AGNEW, until recently sales representative for the company in Arizona, is to be in charge of the company's foreign branch at Lima, Peru. The Gardner-Denver Co. manufactures rock drills and drilling machinery, with plants in Denver, Quincy, Ill., and La Grange, Mo.

—

JOHN FRASER and WILLIAM ELLIS HUGHES have been made directors of A. G. Kidston & Co., Ltd., engaged in the iron, steel and machinery business in Glasgow and London.

—

BLAKE C. HOOPER has been appointed sales manager of the Baker Industrial Truck Division of the Baker-Raulang Co., Cleveland. His first contract with the industrial truck business was in 1916 when he became a manufacturer's representative in St. Paul. In 1921 he was



BLAKE C. HOOPER

appointed Northwest representative of the Baker-Raulang Co. For nine years prior to his entering the industrial truck field, he served in various engineering capacities for the Chicago & Alton, Illinois Central and Rock Island railroads. He will continue in active charge of the company's railroad department.

—

L. E. GRIFFITH has been elected to the board of directors and a vice-presidency of the Riley Stoker Corporation, Worcester, Mass. He was graduated from Lafayette College, Easton, Pa., in 1912. His sales-engineering experience included connections with the Babcock & Wilcox Co. and the United Machine & Mfg. Co. When the Riley Stoker Corporation purchased the United Machine & Mfg. Co., Mr. Griffith was president of the latter company.

—

WILLARD E. FREELAND, some years ago New England editor for THE IRON AGE, later professor of marketing at the Massachusetts Institute of Technology, and recently head of Freeland & Warren, Inc., engaged as consultant in organization, management, merchandising and marketing, announces the formation of a new company to succeed Freeland & Warren, the name of the new company being Freeland, Wansker, Bates & Lawrence, Inc., 805 Statler Building, Boston.

—

MORTEN GRINDAL, who spent about a year in the United States investigating foundry apparatus and machinery, has established his own firm in Sweden as a maker of foundry equipment. He had formerly been engaged in this and allied lines in Norway. His company is the A.-B. Motala Maskiner, Motala, Sweden, and, among other things, has a type of molding machine by which the sand is packed in the flask by subjecting the mold carrier to a hammering action while the mold is under pressure. He has filed patent applications in the United States.

—

PROF. DR. F. KÖRBER, director of the Kaiser-Wilhelm-Institute für Eisenforschung, Düsseldorf, and Prof. Dr. Ing. E. H. SCHULZ, director of the research department of the Vereinigte Stahlwerke, Dortmund, are on a tour of inspection and study in the United States, with present headquarters at the Pennsylvania Hotel, New York.

—

CHARLES P. PERIN, Perin & Marshall, consulting engineers, New York, has returned from a brief visit to England.

—

JAMES A. FARRELL, president and chief executive officer of the United States Steel Corporation, will return to New York on the Aquitania Sept. 6 from a sojourn in France and Spain.

—

JAMES C. ALLEY, pig iron broker, New York, has returned from a two months' motor trip through England, Scotland, Wales and Ireland.

—

E. A. MERCNER, of the Philadelphia sales office of the Bethlehem Steel Co., has been appointed resident agent of a new office the company has opened in the Manufacturers' Association Building, York, Pa. J. E. MURPHY, also of the Philadelphia office, has been appointed resident agent in charge of an office opened in the Wilkes-Barre Deposit & Savings Bank Building, Wilkes-Barre, Pa.

The Orton Crane & Shovel Co. has appointed Thomas D. Crowley & Co., 8 South Michigan Avenue, Chicago, as special railroad sales representative in the United States for the Orton line of locomotive cranes, crawling - tread cranes, shovels and draglines, gantry cranes, truck cranes, and clamshell and orange-peel buckets. Mr. Crowley has been identified with the railroad industry over 25 years. In 1922 he organized his own company for handling railroad equipment.

OBITUARY

EDWARD WORCESTER, until 1922 vice-president in charge of sales, National Tube Co., died at his daughter's home in Pittsburgh on Aug. 28, aged 74 years. He was born at East Bridgewater, Mass., and began his business career with the Chapman Valve Co,

EDWARD WORCESTER

After five years he resigned to become identified with the sales department at the Chicago plant of the National Tube Co. Later he returned to Boston to take charge of sales for the Walworth Mfg. Co. In 1882 he again returned to Chicago, where he was secretary of the Crane Brothers Mfg. Co. In 1886 he became associated with the National Tube Co. at St. Louis, and a short time later was transferred to McKeesport, Pa., where he served as assistant sales manager. He was elected a vice-president of the company in 1903, and served in that capacity until his resignation late in 1922.

—

JACOB SCHONFARBER, general manager Atlantic Tubing Co., Providence, R. I., for whom funeral services were held in that city Tuesday, Aug. 27, will be buried in Baltimore, his native city. He was the victim of an automobile accident Friday night, Aug. 23.

—

FRANKLIN REDMAN HENRY, president Majestic Mfg. Co., St. Louis, maker of cooking apparatus, died Aug. 25, aged 62 years. Before becoming affiliated with the manufacturing company he was a street railway executive in St. Louis. He was a director of the Mississippi Valley Merchants State Trust Co. In 1908 he became vice-president and general manager of the Majestic company and was made its president in 1923.

—

JOSEPH WOLTER, a pioneer shipbuilder in Wisconsin, died at his home in Sturgeon Bay, Wis., Aug. 23, at 72 years of age. He was president of Sturgeon Bay Shipbuilding Corporation, one of the founders of the Rievolt & Wolter Shipbuilding Corporation, Sheboygan, and of the Sheboygan Dredge & Dock Co.

—

HENRY A. TUTTLE, president H. A. Tuttle Mfg. Co., Stamford, Co., which was liquidated in 1906, and later associated with the Evans Stamping & Plating Co., Taunton, Mass., and known also in the gear manufacturing industry, died Wednesday, Aug. 28, at his home in Upton, Mass. Mr. Tuttle was born in Galesburg, Ill., 66 years ago.

Lower Rail-Water Rates to Texas Proposed

Reduction of 7.5c. Per 100 Lb. Suggested in Tariffs Filed with Interstate Commerce Commission

WASHINGTON, Sept. 3.—Rail-and-water freight lines have filed schedules with the Interstate Commerce Commission proposing reduced rates from Atlantic seaboard steel mills to points in Texas.

The reduction to the so-called group 3 in Texas, which includes such points as Dallas, Denison and Corsicana, will amount to 7.5c. per 100 lb. The points of origin include Sparrows Point, Md., and steel centers in eastern Pennsylvania.

The rail-and-water lines, through their agent, W. J. Sedgman, intend to put the lower rates into operation as an offset to the low proportional rates on steel products from the Cleveland, Youngstown, Pittsburgh and Buffalo districts to Western seaboard points, which were allowed on July 10, when the Interstate Commerce Commission decided not to suspend them despite protests from the Chicago Association of Commerce, the Youngstown Chamber of Commerce and the Bethlehem Steel Corporation.

In support of the new schedules proposed in the Sedgman tariffs, it is contended that Eastern steel mills have been deprived of some of their advantage as a result of the low proportionals, and the new rates from the Eastern points have been offered in an effort to restore, in part at least, the situation as it existed prior to July 10.

The filing of the Sedgman tariffs has brought a protest from the independent steel producers in the Chicago district, including the Acme Steel Co., Inland Steel Co., Interstate Iron & Steel Co., Clayton Mark & Co. and the Chicago Association of Commerce. Steel producers in the Chicago district, it is stated, use the all-rail routes to the Southwest, while competitors as near by as Lorain, Ohio and Cleveland are able to use the rates of the rail-and-water lines because of the low proportional rates.

The effect upon the steel consumers in Texas is to permit them, under the proportional rates and the proposed Sedgman rates from the East, to draw upon a larger area in buying their steel.

Electrochemists to Discuss Aeronautics

At the coming convention of electrochemists to be held in Pittsburgh, Sept. 19 to 21, emphasis will be placed on the close interrelation of aeronautics and electrochemistry.

W. P. Dobson and A. S. L. Barnes, engineers of the Hydro-Electric Power Commission of Toronto, Ont., will present data on the production of hydrogen by electrochemical decomposition of water. Some of the newer types of cells will take as much as 15,000 amp., producing 250 cu. ft. of hydrogen an hour.

Light Alloys for Aircraft

(*Concluded from page* 616)

about the same as cast iron. Its resistance to corrosion is greater than that of aluminum. With these excellent properties, beryllium has a serious fault as a structural material in that it lacks ductility. However, he believed that a ductile alloy consisting almost entirely of beryllium will eventually be developed; the task is not easy, although work has so far met with much encouragement. Light ductile alloys containing up to 60 per cent of beryllium have been made with a reported tensile strength of 80,000 lb. per sq. in. Such alloys have a density nearer to magnesium and should have a wide field of application.

For some uses it is not necessary to have an alloy that is even moderately ductile. In its unalloyed and rather brittle state beryllium could probably be used for pistons and for castings where low density would allow it to replace cast iron to advantage. There seems to be an adequate supply of beryl and the speaker believed that beryllium eventually will be produced at $1.40 to $2.70 per lb.

The Houston, Tex., office of the Chain Belt Co., Milwaukee, manufacturer of Rex deep well oil chains, conveyors and concrete mixers, has moved to larger quarters at 1310 Second National Bank Building. Russell G. Davis is manager.

Manganese Producers to Discuss New Processes

American Manganese Producers Association will meet at the Mayflower Hotel, Washington, Sept. 9 and 10. On the first day the meeting will listen to a report on the condition of the industry by representatives from States in which manganese occurs. On Sept. 10 the following papers describing recent developments in concentration of manganese ore will be read:

"The Bradley Process," by Wilson Bradley, president Bradley-Fitch Co.

"Flotation of Carbonate and Oxide Manganese Ores," by Will H. Coghill, superintendent, Bureau of Mines Experimental Station, Rolla, Mo.

"New Processes," by Prof. A. T. Sweet, Michigan College of Mines.

Italy to Make Magnesium, Aluminum and Alloys

A group of metallurgical industries is in process of completion in the new port of Venice, consisting of three allied electrometallurgical installations for the manufacture of magnesium-aluminum and its products, according to Consul James B. Young at Venice. The group includes an aluminum industry, a magnesium industry and one producing magnesium-aluminum and its products, working these two component metals and their alloys. The plants of this group will be adjacent to each other.

One of the primary objects of these new industries is the Italian manufacture of light metals, especially for the aircraft industry as well as for automotive, electrical and other consumption. The well-known properties of magnesium and its alloys form a demand for these metals. Magnesium-aluminum is showing the first signs of a possible future general supplanting of copper for high-tension electric power transmission lines in Italy, and the Venetian plant, not yet completed, already has a contract for wire for that purpose.

The aluminum plant of this group has been completed and in operation for some months with an output of about 3000 metric tons of aluminum a year. Production will be increased to about 6000 tons a year by the addition of five more batteries of electric furnaces. When completed it is planned to have an approximate total output of 20,000 tons of alumina, 6000 tons of aluminum and 6000 electrodes.

The magnesium plant now in process of construction is to start with an output of about 250 tons of magnesium annually. This is to be doubled in the near future, and later development will bring a total annual output of 2000 tons.

It is the intention to reduce the dependence of Italy on foreign copper and at the same time to build up an exportation of magnesium electrometallurgical products, as well as of aluminum and aluminum products and alloys.

Dr. Gwyer for Institute of Metals Fall Lecture

Arrangements for the Düsseldorf meeting of the Institute of Metals are now complete. Over 200 persons from ten different countries will take part. The proceedings will open on Sept. 9 with the annual autumn lecture, which will be given by Dr. A. G. C. Gwyer on "Aluminum and Its Alloys." Dr. Gwyer of Warrington, England, is a member of council of the Institute of Metals and an original member of the institute. He studied at University College (now the University of Bristol). He spent two years at the University of Göttingen, carrying out metallographical research under Prof. Tammann. In 1912 he became research metallurgist to the British Aluminum Co., Ltd., Milton, Staffordshire. He was transferred in 1915 to the Warrington Works of the same company and in 1920 was appointed chief metallurgist.

Spiegeleisen Imports Are Large This Year

Shipments of spiegeleisen from foreign makers into the United States are on a larger scale this year than for some time. To Aug. 1, this year, Government statistics show that 11,243 tons had been entered, having a valuation of $326,910 or approximately $29 per ton. This year's shipments, which are at the rate of 1606 tons per month, are nearly four times the receipts in 1928, which were 435 tons per month. In 1927 the imports were 621 tons per month.

Tungsten's Industrial Value —American Requirements

The enormous saving to industry which has resulted from the use of tungsten is revealed in a bulletin which has just been issued by the Commerce Department. Two uses of this metal, the bulletin points out, overshadow all others, namely, high-speed tool steel and tungsten filament used in incandescent lights. The use of tungsten in high-speed tool steel exercises an important influence upon industries of all kinds. In comparison with steels used a few years ago, high-speed tungsten tool steel has caused a five-fold increase in efficiency, has eliminated waste in time, and has saved millions of dollars annually in labor.

The use of the tungsten filament decreases the power requirement and increases the candle power of the globe. It has been estimated that, owing to the adaptation of tungsten in incandescent light, a net saving of $240,000,000 a year has resulted.

Requirements of the United States are estimated to be about 4000 tons annually of 60 per cent tungstic trioxide concentrate, with domestic production amounting to about one-quarter of this amount. By far the greater part of the world's production comes from China, and that country may be said to dominate the world's market in tungsten. The bulk of the world production of this metal is utilized by the steel-manufacturing countries.

Graduate Courses in Metallurgy

Evening courses in engineering and chemistry, leading eventually to the master's degree, are announced by Polytechnic Institute of Brooklyn, Court and Livingston Streets, Brooklyn, N. Y. These courses are in chemistry, civil engineering, electrical engineering, mechanical engineering, mathematics, physics and engineering economics.

Two of the courses deal with metallurgy and metallography. The course in industrial metallurgy is to be given on Thursday evenings from 6:30 to 8:30. The course in nonferrous metallography will be given on Wednesday evenings from 6:30 to 9:30, the first hour of this period being devoted to a lecture, and the remaining two hours to laboratory practice.

In celebration of the completion of extensions to its foundry, the Industrial Steel Castings Co., Toledo, Ohio, kept open house Aug. 20 and entertained guests from Chicago, Detroit, Cleveland and other cities. After luncheon in the plant the foundry was inspected by the guests. With its additions, the company has increased its molding capacity 250 per cent and its pattern department 500 per cent. This enlargement is the second in three years.

Production and Shipment of Raw Materials and Finished Products

	July, 1929	June, 1929	July, 1928
Steel barrels produced (a)	790,175	774,853	647,844
Steel barrels shipped (a)	782,411	779,567	645,881
Steel barrels unfilled orders (b)	1,372,697	1,548,999	1,232,412
Steel barrels produced (a), 7 months	5,041,199	.....	4,356,436
Babbitt metal consumed (a), lb.	5,360,711	5,927,907	4,692,825
	June, 1929	May, 1929	June, 1928

(b) End of month.

Growing Size of Airplane Industry

Approximately 25,000 people are employed directly in the manufacture of airplanes and airplane motors in the United States, according to a survey made by the Bureau of Labor Statistics, Department of Labor. It is pointed out that modern industrial development is creating an increasing amount of labor-saving machinery which is displacing men and that, therefore, the development of any new industry is of great importance in giving employment to the men displaced by improved machinery elsewhere.

Aside from manufacturing, the airplane industry gives employment to much other labor, both directly and indirectly, the bureau states. Factories and hangars must be built; pilots both for mail and commercial work must be employed; schools of instruction are coming into existence; and many mechanics and other ground employees are needed at air fields. Employment is given also, it is stated, to persons engaged in the manufacture of material, metal, wood, cloth, rubber, etc., used in planes. Moreover, airplanes also have their effects on the production, distribution and consumption of gasoline.

In an article in the August issue of *Monthly Labor Review*, the bureau said that plants manufacturing airplanes are found in 29 States, New York being the most important, with 4396 employees, followed by California, with 1605. Other States with more than 1000 persons employed in the making of airplanes are Michigan, Washington, Kansas and Ohio.

Of the 101 firms from which reports were received, 78 produced airplanes during 1928, the output being 4886 planes. The indications were said to be that the 1929 production will be much greater. Of the 23 plants engaged in making motors, 17 had some product in 1928, when 3684 motors were made in these plants. New Jersey and Connecticut were the ranking States.

Iron Ore Imports Much Heavier in July

July imports of iron ore at 301,418 gross tons were the largest since August, 1927, when 303,586 tons came in. With that exception, the July total was the largest since July, 1923, when 439,367 tons was received. While the July tonnage was only 24 per cent greater than in June, it exceeded July, 1928, by about 65 per cent.

For the seven elapsed months a total of 1,769,154 tons has come in. This shows a gain of 21 per cent over the imports for the corresponding period of last year. Chile still leads, with a little more than half the total. The principal differences from last year include the doubling of shipments from Cuba, a great increase in those from Sweden, where a year ago a strike was in progress, and a large reduction in imports from French Africa.

SOURCES OF AMERICAN IMPORTS OF IRON ORE
(In Gross Tons)

	July		Seven Months Ended July	
	1929	1928	1929	1928
Canada	2,051	1,596	2,556	44,322
Cuba	68,450	11,000	388,350	190,286
Chile	140,192	102,000	912,867	817,500
Spain	18	4,300	38,231	16,203
Sweden	42,388	.....	165,470	19,614
French Africa	11,750	40,760	109,660	282,131
Other countries	36,569	23,600	152,020	81,613
Total	301,418	183,256	1,769,154	1,451,669

Offers Free Course in Physical Chemistry

To bridge an important gap in engineering education, by making available to older men employed in the chemical industries the latest developments in chemical engineering, Cooper Union's Institute of Technology, New York, will inaugurate in the fall a free evening course in physical chemistry, thermodynamics and allied subjects.

The purpose of the course, it is explained, is to assist those men who obtained their engineering degrees, before some of the most recent discoveries and methods were taught, to supplement their experience by a complete knowledge of the best modern practice, as recommended by the foremost engineering schools.

Propose Studies on Wire Rope

All persons interested in the manufacture or use of wire rope are invited to a conference at Engineering Societies Building, New York, at 2 p. m., Sept. 13. This is the third conference on this subject to be held within six months under the auspices of the American Society of Mechanical Engineers research committee and Engineering Foundation to discuss the desirability of organizing a research committee in the United States to advance the knowledge of the properties and life of wire rope through a cooperative investigation.

The formal part of the program will consist of brief papers presented by men well informed on the many applications of wire rope in the various fields of engineering and industry. Dr. Conrad Matschoss, director Verein Deutscher Ingenieure, will be present and will tell of the studies now being conducted by the German wire rope committee. A report, prepared by Dr. W. A. Scoble, will also be read describing the work of the Wire Ropes Committee of the Institution of Mechanical Engineers in Great Britain.

Free Course Offered by San Francisco Steel Treaters

A free course in practical metallurgy has been sponsored by the Golden Gate Chapter of the American Society for Steel Treating at San Francisco. There are to be 18 lectures covering the manufacture of steel, with particular stress upon heat treatment and specifications for various uses. A laboratory course will also be given to those qualified. This course will cover actual heat treatment, physical tests and microscopical examination of the commonly used steels.

Registrations may now be made for the course at the Humboldt Evening High School, Eighteenth and Dolores Streets, San Francisco. The chairman of the educational committee is S. R. Thurston.

Advantages of Steel-Frame Houses Pointed Out

Many advantages of steel-frame residences were revealed in a recent prize contest for that type of structure sponsored by the Connecticut Architectural League. L. R. Hammond, chairman of the contest committee, in reporting results to the American Institute of Steel Construction, Inc., stated that information obtained through the contest indicates that steel frame is the method of house construction which will most nearly permit 75 per cent of the work to be done in the factory on a basis of 312 days of work for 312 days of pay, as against 312 days of pay for 200 days of work, the present arrangement.

In addition, the steel frame provides opportunity for a quality of precision and coordination of all service installations, such as water, heat, electric power and light and ventilation, with a corresponding great reduction in cost, which seems practically impossible in older methods of house construction.

Chart on Molybdenum Steels

An attractive chart has been issued by the Climax Molybdenum Co., 61 Broadway, New York, showing the ratio of carbon steel to alloy steel production from 1921 to 1928 inclusive, with a small chart, as an insert, illustrating the approximate annual production in tons of molybdenum steel and iron for the same period. The ratio of carbon steel to alloy steel production was 15.03 to 1 in 1928 as against 23.43 to 1 in 1921. The consumption of molybdenum alloy steel is estimated to have reached 400,000 tons in 1928, as against only 150,000 tons in 1925 and about 10,000 tons in 1921.

European Markets Show Little Activity

German Output High But Business Quiet—British Structural Material Shows Fall Revival—France Worried Over American Tariff

(*By Cablegram*)

LONDON, ENGLAND, Sept. 2.

DESPITE the effect of the holidays, Cleveland blast furnaces are still busy, with little foundry iron to offer for September. An early improvement in the demand is generally anticipated. Hematite is rather more firm but the price still remains below cost.

New demand for British finished steel is dull, but there is increasing demand for structural material, which is considered a favorable augury of approaching autumn revival. Mills rolling sections are quite active.

Considerably better demand has developed for tin plate and prices have advanced fully 3d. to 18s. 6d. ($4.48) to 18s. 9d. ($4.54) basis. Welsh steel bars have been raised officially 3s. 9d. (85c.) to £6 10s. ($31.52) delivered. The reason is said to be the improved industrial outlook here, due to the reparations settlement at The Hague. Inquiries for tin plate are coming forward from most of the overseas consuming countries.

Brisk demand has been seen latterly for galvanized sheets, but India still is apathetic. Makers are now more comfortably placed and most of them are quoting £13 10s. ($65.47) f.o.b. works port.

Black sheet markets are slow, but the undertone is firm on account of dearer sheet bars.

Formation of a big British steel works combine, referred to in previous cablegrams, has now been concluded in principle, it is stated, between Dorman, Long & Co., Ltd., Middlesbrough, and Bolckow, Vaughn & Co., Ltd., also at Middlesbrough. It will probably eventually take in other North East Coast firms, to form a North East Coast combine, and other developments later.

David Colville (David Colville & Sons, Ltd., Glasgow) is said to be initiating steps for a consolidation of Scottish steelworks.

Clyde shipbuilding results in August included the launching of 17 vessels, aggregating 49,000 gross register tons. The total for eight months is less than last year.

Babcock & Wilcox, Ltd., London, has purchased a 49 per cent interest in the Polish boiler works of Zieleniewski, Fitzner, Gamper.

Continental markets are still rather easy, though sentiment is again tending toward optimism.

The International Wire Cartel is meeting in Luxemburg on Sept. 17, and the Irma (International Rail Maker's Association) at Vienna on Sept. 25.

German output for July was 1,200,000 (metric) tons of pig iron, 1,466,000 tons of raw steel (ingots and castings) and 1,029,000 tons of rolled steel.

Saar raw steel production in July made a new post-war record at 198,000 tons, but pig iron output was lower, at 184,000 tons.

Italian steelworks have established a central selling syndicate, after the lapse of 18 months.

German Business Quiet

Iron and Steel Output at High Level—Machinery Exports Larger Than Last Year

BERLIN, GERMANY, Aug. 19.—The improvement in business apparent in the spring has slackened and reports of the labor unions on unemployment show a slight increase in July. The number of bankruptcies is larger than a year ago. The trend of wages is slightly upward, but the average weekly wage of skilled workers in the iron, steel and non-ferrous metal industries in July was $12 with unskilled labor earning an average of $9.02. These are wage-agreement rates and include the legal supple-

ments paid to married workers with two children.

The vacation season and uncertainty as to the result of the reparations conference at The Hague have checked activity in the steel industry. Recently stocks of steel companies have advanced rapidly, as a result of high rates of production, large exports and general optimism over renewal of the domestic syndicates and prolongation of the International Steel Cartel. Following the announcement that the General Electric Co. in the United States will participate in the Allegemeine Electricitäts Gesellschaft in Germany, stock of the latter company has advanced from 160 to 205.

German Production High

Pig iron production in July reached a new high of 1,203,510 tons. In the first seven months of the year pig iron output was 7,772,314 tons, compared with 7,621,974 tons in the first seven months of 1928. The total production of pig iron for this year is expected to exceed the 1927 total of 13,102,528 tons, the largest post-war year. The domestic pig iron market is unchanged, but some tendency to weakness is evident in export prices.

The export market for rolled products has begun to improve following the recent period of weakness in prices and the Stahlwerksverband has advanced its export price on steel bars at £5 14s. to £5 15s. a ton (1.23c. to 1.24c. a lb.), f.o.b. Antwerp or Hamburg. The export price of beams and certain other products has been slightly reduced. The wire market is weak. Wire rod demand is small and with the exception of some revision of prices for export to Far Eastern markets the International Wire Rod Cartel has retained the official price of £6 5s. ($30.31) per ton.

Export business in machine tools and agricultural machinery is increasing. The Westmark Industrie Co., jointly operated by the Karl-August Huette and the Hoch und Tiefbaufirma Gruenzig, has received a 50,000,000 m. ($11,900,000) contract to sink mines, furnish equipment and erect 1000 dwellings for miners for the Société des Charbonnages de Faulquamont. The entire transaction will be charged to reparations account as deliveries in kind. Exports of machinery in the first half of this year totaled 304,134 tons, a monthly average of 51,000 tons, compared with an average of 44,800 tons a month in 1928.

The small automobile market is more active, with current sales about 5 per cent greater than a year ago. The motorcycle industry reports record production with 115,000 motorcycles produced in the first half of this year and a total output of 190,000 estimated for the entire year. Imports of motorcycles in the first half of this year were 5643, compared with 4377 exported.

Japan Inquires for German Wire Mill Machinery

HAMBURG, GERMANY, Aug. 19.—Builders of wire drawing machinery and rolling mills have received inquiries from Japan for equipment for a new mill to produce wire rods and wire at the Imperial Steel Works at Yawata. The estimated capacity of the new mill is 150,000 tons a year, but it is reported that a definite decision to establish it has not yet been reached. Most of the wire mills recently built in Japan have been equipped with German machinery.

Cartel Meeting to Discuss Syndicates and Quotas

BERLIN, GERMANY, Aug. 19.—The next meeting of the International Steel Cartel will be held Sept. 12, probably in Vienna, at which time it is expected that the cartel will be prolonged for a brief period to permit negotiations to settle various differences of opinion. Belgium is understood to be indifferent and somewhat opposed to the creation of selling and price-fixing syndicates for separate products. Belgian objections are based on the fact that lower production costs in Belgium permit Belgian mills to sell profitably in open competition.

Much of the discussion at the cartel meeting is expected to be devoted to the question of larger quotas. Belgium as well as Germany has never been satisfied with the quotas. It is claimed by Rhenish-Westphalian mills that Belgian producers, to establish proof of the necessity of an increase in their quotas, are pushing production, even though present sales do not warrant present operations.

Germany Buys Swedish Ore

DÜSSELDORF, GERMANY, Aug. 21.—The Vereinigte Stahlwerke A. G. has concluded a new contract for iron ore with the Grängesberg company for delivery of Swedish ore in 1933 to 1942. In the second quarter of this year imports of iron ore were 5,029,200 tons, compared with 3,307,600 tons in the same period of 1928, when deliveries were curtailed by the strike in Sweden. The iron ore market is active and German consumers are paying 2s. (48c.) a ton more on new contracts than was paid on contracts last year. The entire German manganese ore requirements for 1930 are reported to have been covered.

African Manganese Ore Sold

Recently South African manganese ore has appeared in the European market and the South African Manganese Ore Corporation has appointed William H. Muller & Co., of The Hague, Holland, as distributers. The quality of the ore is said to be high with manganese content ranging up to 54 per cent.

Tariff Proposals Stir France to Discussion

BORDEAUX, FRANCE., Aug. 15.—The United States tariff proposals have aroused considerable discussion among steel producers in France and it is generally believed that, under the proposed schedule, export of iron, steel and machinery to the United States will be practically impossible. At the same time it is suggested in many quarters that American competition in Continental markets and throughout the world will increase as production grows in excess of domestic requirements.

It is not expected that the representations of 38 nations will have any important influence on application of the new tariff and it is pointed out that, even though certain duties are not increased, they may be raised 50 per cent at a later date under the flexible provision of the tariff.

Locomotive Building Capacity Reduced

BERLIN, GERMANY, Aug. 19.—As part of the movement that has developed to reduce locomotive building capacity, the Locomotivfabrik Hohenzollern, controlled by the Haniel interests, has closed and transferred its quota in the association of locomotive builders to the Friedrich Krupp A. G. The quota of 7.85 per cent, added to the present Krupp quota, gives the latter company a total of 13.8 per cent of the German output.

It is expected that the Linke-Hofmann-Buschwerke and possibly the Allegemeine Electricitäts Gesellshaft will surrender their quotas, which will hasten the concentration of capacity. It is reported that the negotiations between the Rumanian Government and the Allegemeine company for 100 locomotives have been concluded.

Germans Sue Competitor for Price Cutting

HAMBURG, GERMANY, Aug. 19.—An unusual legal proceeding has been taken by former members of the Syndicate of Weldless Bored Tubes, which was formed in February and automatically dissolved this month. Dissolution of the syndicate was the result of one member selling tubes at prices considerably less than the established schedule of the cartel. The remaining members have now taken legal action before the Cartel Court, claiming damages from the member underselling the established market, for dissolution of the cartel and for loss of various orders. The damages claimed are in excess of the penalty provided in the cartel agreement. As such cases are frequent among the cartels, the decision of the Court is considered of great importance.

Administrative Changes in Tariff Bill

Senate Finance Committee Would Determine Competitive Level, Cost of Transportation and Labor Participation

WASHINGTON, Sept. 3.—The Senate Committee on Finance, in its majority report on the tariff bill, made public today, said that its changes of the House bill affect about 40 upward revisions of individual rates in the metal schedule and over 60 downward revisions, including items transferred to or from the free list. The plan is to report the bill tomorrow to the Senate and to take it for consideration on Thursday.

Reference was made to the fact that all duties in the steel schedule were reduced by an amount compensatory both for the transfer of manganese ore to the free list and for reductions in the rates on manganese alloys.

"Advances in research and in the development of new products since the tariff act of 1922 resulted in a more comprehensive treatment of alloys in the House bill," the report continued. "There are, however, a number of products of the rare metals which were not adequately provided for in the House bill, and a revision of a few of the rates appeared warranted. The rates on tungsten ore, alloys of silicon, and aluminum, chromium and its alloys, and cerium metal and its alloys were decreased. Reclassification of tantalum and its alloys and the addition of carbides of tungsten and molybdenum and products composed of these metals results in some instances in increases in rates.

"Nickel oxide was transferred to the free list, as were zinc dross and skimmings. A sliding scale, based on New York market prices, was introduced for antimony metal with rates designed to exercise a stabilizing influence on prices which have shown marked fluctuations during post-war years. It is thought that the present bill provides adequately for non-ferrous metals and their derivatives and that the phraseology and rate structure is sufficiently comprehensive to provide equitable rates for products most likely to be developed within the next few years."

The Senate committee modified the House bill so as to retain the existing law providing for six bipartisan commissioners. Under the present act the term of a commissioner is 12 yr. The House bill provided for terms of 7 yr. The Senate committee amendment proposes terms of 6 yr. except that in case of the first six new appointees, their terms are to be designated by the President at the time of nomination so they may expire one at the end of each of the first 6 yr. after the date of the enactment of the bill. The increase in salary of the commissioners to $12,000, as provided in the House bill, was retained.

Describing the difficulties in administering the flexible provisions of the tariff act which permits the President, after investigation by the Tariff Commission, to increase or decrease duties by not more than 50 per cent, the Senate committee provided for factors not included in the House bill for ascertaining whether or not the foreign and domestic articles are upon a competitive level in the domestic market.

It inserted a definition of the term "costs of transportation," not defined in the present law." The committee is of the opinion that the imported article should be allowed costs of transportation from areas of substantial production in the principal competing foreign country to the principal port of importation in the United States, and that the domestic article be allowed the costs of transportation from areas of substantial production that can reasonably be expected to ship the article to such principal port of importation."

In ascertaining the principal competing country with respect to any imported article the President is to take into consideration the quantity, value, and quality of the article imported from each competitive country and any other differences in the conditions under which the article imported from each such country competes with the like or similar competitive domestic article.

The Senate committee continues the provision in the present law and in the House bill which provides for appeal from the Customs Court of Appeals to the United States Supreme Court in suits relating to unfair methods in the import trade and left the final decision with the Customs Court.

The Senate committee continues largely the foreign basis of valuation but calls for alternative systems of American valuation in cases where United States appraisers are unable to satisfactorily determine foreign costs of value. The Senate committee also inserted an amendment requiring the commission to convert the duties named in the bill to equivalent rates on the basis of domestic value, as distinguished from American valuation, and to report to Congress. This provision looks to the eventual adoption of the United States value as the basis of fixing ad valorem rates of duties.

The Senate committee bill provides that United States value of imported merchandise shall be the price at which the imported merchandise is offered for sale in the principal market in the United States in wholesale quantities, or, if similar imported merchandise is not so offered for sale in the United States, then an estimated value, based on the price at which comparable merchandise, imported or domestic, is offered for sale, with such adjustments as may be necessary owing to differences in the characteristics of given products.

Several requests of the American Federation of Labor were granted by the Senate committee. One was that articles designated by an American trade mark must be actually manufactured in the United States instead of in foreign countries with lower labor costs. Another was complied with when the committee added "mined or produced" to the act forbidding the importation of convict-manufactured goods. Another provision permits labor organizations, along with domestic manufacturers, to appear as a party in interest in any reappraisement proceeding and in any protest against the collector's decision.

Canadian Pig Iron Output at Peak in July

TORONTO, ONT., Sept. 3.—Production of pig iron in Canada in July amounted to 99,786 tons, according to a statement published by the Dominion Bureau of Statistics. This output was the highest recorded for the current year and marked an advance of 11 per cent over the 89,873 tons produced in June, and a gain of 5 per cent over the total of 95,422 tons made in July, 1928.

Compared with the figures for June, data for July showed an advance in the output of basic iron to 79,241 tons from 68,059 tons and a slight drop in foundry iron output to 14,779 tons from 16,252 tons; production of malleable iron was 5766 tons against 5562 tons in June.

For the seven months ended July 31 the production of pig iron in Canada was 618,343 tons, an increase of 10 per cent over the total of 563,435 tons made during the corresponding period of 1928, which in turn was 24 per cent greater than the output of 454,710 tons produced during the first seven months of 1927. This year's output included 480,999 tons of basic iron, 101,831 tons of foundry iron and 35,513 tons of malleable.

Production of ferroalloys in Canada in July totaled 7030 gross tons, an increase of 12 per cent over the June output of 6261 tons.

Output of steel ingots and direct steel castings amounted to 129,827 tons in July. This total represented an increase of 9 per cent over the output of 119,505 tons of the previous month and was 57 per cent greater than the total of 82,807 tons reported for July, 1928. Output of ingots increased to 123,248 tons from 113,341 tons and steel castings to 6579 tons from 6164 tons in June. For the seven months ended July 31, 1929, the production of steel ingots and direct steel castings was 868,669 tons, or 19 per cent more than the 731,145 tons during the first seven months of 1928, which in turn was 35 per cent over the 542,560 tons reported for the corresponding period of 1927. This year's output to date included 826,848 tons of ingots and 41,821 tons of castings.

Iron and Steel Institute to Hold Extra Meetings

In addition to the regular autumn meeting of the Iron and Steel Institute at Newcastle-upon-Tyne, England, Sept. 9 to 11, a meeting has been arranged for Tuesday, Sept. 17, in the Secondary Schools, Doncaster Road, Scunthorpe, England, by arrangement with the Lincolnshire Iron and Steel Institute. Another extra meeting will be held at the Birmingham Chamber of Commerce, Birmingham, England, Thursday evening, Sept. 26, by arrangement with the British Cast Iron Research Association. At each of these additional meetings some of the papers which are scheduled for the autumn general meeting will be repeated.

Donner Steel to Expand; Earnings Increase

Announcement has been made by the Donner Steel Co. of the acquisition of a tract of land adjoining its present plant in Buffalo as the site for a new finishing mill, details of which are temporarily withheld. The company has also purchased 30 acres of property across the street from the present plant. This tract will be used in the future for docking and switching facilities. The installation of the new mill will cost $2,000,000.

Net income of the Donner company for the first six months of 1929 showed an increase of 227 per cent over the corresponding period in 1928 and indications are that the net income for the year will be the largest in the history of the plant.

Larger Stocks of Industrial Coal

Stocks of anthracite and bituminous coal in industrial plants in the United States and Canada on Aug. 1 are estimated by the National Association of Purchasing Agents at 32,712,000 net tons. This shows a gain of more than 4 per cent from the 31,415,000 tons on July 1 and is the largest total since May 1. It is estimated that industrial consumption during July was 35,040,000 tons, whereas United States production totaled 45,635,000 tons.

Supplies on hand are estimated as averaging 27 days' use at current rates of consumption. Steel mills have 27 days' supplies; railroads, 19 days'; by-product coke plants, 24 days'; electric utilities and coal gas plants, 46 days' and other industries, 32 days'.

To Demonstrate Haystellite Cutting Tools

Demonstrations of Haystellite, the cast tungsten-carbide cutting alloy made by the Haynes Stellite Co., Kokomo, Ind., will be conducted in the show rooms of Strong, Carlisle & Hammond, 1392 West Third Street, Cleveland, during the week of the National Metals Exposition, to be held in Cleveland, Sept. 9-13.

Cast iron and semi-steel will be machined on a special heavy-duty high-speed lathe equipped with the Haystellite tools.

Packages Bound by Metal Tie

A metal tie binding method has been developed by the Gerrard Co., Inc., Chicago. Wire is looped around a package, threaded through the machine and the tie completed with one throw of the lever forward and backward which tensions, seals and trims the ends. It is claimed that shippers using this method are saving 30 per cent and upward in time.

Pullman Co. to Buy 18 Machine Tools

The Pullman Co. will buy the following motor-driven machine tools for Buffalo, N. Y.: 4 14-in. grinders; 1 21-in. grinder; 1 36-in. x 8 ft. planer; 1 20-in. drill press; 1 18-in. engine lathe; 1 4-ft. radial drill; 1 24-in. heavy-duty drill; 1 18-in. shaper; 1 No. 2 milling machine; 1 16-in. lathe; 1 24-in. lathe; 1 power hack saw; 1 bolt threader, 2-in; 1 18-in. drill; 1 bench grinder.

To Make Roller Bearings

Tyson Roller Bearing Co., Canton, Ohio, has been organized with a capital stock of $3,000,000, and it is announced it will shortly begin the erection of the first unit of a new plant. The company will manufacture a type of roller bearing designed by Frank Tyson, who will be chief engineer of the new organization.

Production and Shipment of Steel Furniture and Shelving

	July, 1929	June, 1929	July, 1928
Steel furniture, new orders (a)	$2,559,991	$2,521,630 (c)	$2,594,216
Do., shipments (a)	2,624,552	2,573,674	2,515,482
Do., unfilled orders (a) (b)	2,240,260	2,320,032	2,071,553
Steel shelving, new orders (a)	939,057 (d)	958,866	713,330
Do., shipments (a)	867,496 (e)	920,355	722,516
Do., unfilled orders (a) (b)	999,328 (f)	934,129	705,657

(a) United States Department of Commerce.
(b) End of month.
(c) Smallest since November, 1927.
(d) Smallest since last February.
(e) Smallest since last December.
(f) Largest on record.

COMING MEETINGS

Lake Superior Mining Institute. Sept. 6 and 7. Annual meeting, Houghton Club, Houghton, Mich. A. J. Yungbluth, Ishpeming, Mich., secretary.

American Manganese Producers' Association. Sept. 9 and 10. Annual meeting, Mayflower Hotel, Washington. Harold A. Pumpelly, Metropolitan Bank Building, Washington, secretary.

American Society for Steel Treating. Sept. 9 to 13. National metals congress and exposition, Hotel Cleveland and Public Auditorium, Cleveland. W. H. Eisenman, 7016 Euclid Avenue, Cleveland, secretary.

American Institute of Mining and Metallurgical Engineers. Sept. 9 to 13. Annual meeting of Institute of Metals and iron and steel division, Hotel Cleveland, Cleveland. H. Foster Bain, 29 West Thirty-ninth Street, New York, secretary.

American Society of Mechanical Engineers. Sept. 11 to 13. Iron and steel division, Hotel Hollenden, Cleveland. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

American Welding Society. Sept. 9 to 12. Fall meeting, Hotel Statler, Cleveland. M. M. Kelly, 33 West Thirty-ninth Street, New York, secretary.

Institute of Metals (British). Sept. 9 to 12. Fall meeting, Düsseldorf, Germany. G. Shaw Scott, 36 Victoria Street, London, S. W. 1, England, secretary.

Iron and Steel Institute (British). Sept. 10 to 13. Fall meeting, Newcastle-on-Tyne, England. George C. Lloyd, 28 Victoria Street, London, S. W. 1, England, secretary.

American Railway Tool Foremen's Association. Sept. 11 to 13. Annual convention, Hotel Sherman, Chicago. F. A. Armstrong, 546 West Monroe Street, Chicago, secretary.

American Electrochemical Society. Sept. 19 to 21. Fall meeting, William Penn Hotel, Pittsburgh. Colin G. Fink, Columbia University, New York, secretary.

American Refractories Institute. Sept. 24 and 25. Fall meeting with Refractories Division of the American Ceramic Society, Deshler-Wallick Hotel, Columbus, Ohio. Dorothy A. Texter, Oliver Building, Pittsburgh, secretary.

American Drop Forging Institute. Sept. 25 to 27. Fall meeting, Buckwood Inn, Shawnee-on-Delaware, Pa. C. H. Smith, president, Steel Improvement & Forge Co., Cleveland, chairman of convention committee.

Concrete Reinforcing Steel Institute. Sept. 30 to Oct. 2. Semi-annual meeting, Wawasee Hotel, Wawasee, Ind. M. A. Beeman, 2112 Tribune Tower, Chicago, secretary.

National Industrial Advertisers' Association. Sept. 30 to Oct. 2. Eighth annual convention, Gibson Hotel, Cincinnati. Benjamin H. Miller, 420 Lexington Avenue, New York, secretary.

National Machine Tool Builders' Association. Sept. 30 to Oct. 4. Second machine tool exposition, Public Auditorium, Cleveland. E. F. DuBrul, 617 Vine Street, Cleveland, manager.

National Safety Council. Sept. 30 to Oct. 4. Eighteenth annual congress, Stevens Hotel, Chicago. W. H. Cameron, 108 East Ohio Street, Chicago, managing director.

Machinery Markets and News of the Works

August Makes Unusual Showing

Tool Sales Were Little Short of July Level—General Electric Inquiring for 80 Machines

SIZABLE purchases by several important buyers and a consistently good volume of orders from miscellaneous sources raised the August level of machine tool sales to a point little short of July and within striking distance of June and May.

In view of the fact that August is usually a rather dull midsummer month, with business adversely affected by the vacation season, this is regarded as an exceptionally good showing.

Moreover, inquiries are of such substantial volume that bookings should continue at a satisfactory rate during the next few months.

Although fresh orders have tapered slightly in the past month, the delivery situation has not improved. Most of the leading machine tool builders have enough business to last out the year and deliveries extending into 1930 are now commonly quoted on a number of types of tools.

The International Harvester Co. has bought most of the special purpose tools and standard machines for its Farmall tractor plant at Rock Island, Ill., but still must buy tool room equipment.

The General Electric Co. is inquiring for about 80 machine tools, many of which are reported to be for the department developing apparatus for talking motion pictures. The list includes 20 engine lathes, 19 milling machines, five of which are of the vertical type, six hand screw machines, seven sensitive drilling machines and a variety of other types of tools.

Tool and die shops are exceptionally busy and have been steady buyers in the Chicago market. Good used tools are scarce and used tools are not looked upon as offering serious competition to new equipment.

New York

NEW YORK, Sept. 3.—The General Electric Co., Schenectady, N. Y., has issued an inquiry for about 80 machine tools, many of which are said to be for the department working on the development of apparatus for talking moving pictures. The list includes 20 engine lathes, 19 milling machines, including five vertical, 6 hand screw machines, 7 sensitive drilling machines and a variety of other types of tools. August business has been exceptionally good with many of the leading sellers, the volume running close to that of July, which in a few instances was the best month of the year. Most of the leading machine tool builders have enough business on their books to last out the year. Deliveries extending into 1930 are now commonly quoted on a number of types of tools.

Dry Ice Corporation of America, Inc., 50 East Forty-second Street, New York, manufacturer of freezing materials under a carbon dioxide gas process, is arranging expansion program during next six to nine months, including construction of six new plant units at points in South and on Pacific coast, to increase present output from 170 to 370 tons per day, reported to cost $225,000 with equipment. Enlargements will also be made in several present plants. Robert R. Rust is president.

Brooklyn Edison Co., Pearl and Willoughby Streets, Brooklyn, is having plans drawn for six-story equipment storage and distributing building, with mechanical service and repair divisions, as well as automobile service, repair and garage department at Fourth Avenue and Third Street, to cost $1,000,000 with equipment, Voorhees, Gmelin & Walker, 101 Park Avenue, New York, are architects.

H. J. Nurick, 44 Court Street, Brooklyn, architect, has plans for a multi-story automobile service, repair and garage building at Livonia Avenue and Barrett Street, to cost about $100,000 with equipment.

Curtiss Airports Corporation, 27-29 West Fifty-seventh Street, New York, is planning airport at Alameda, Cal., near San Francisco, for land and seaplanes, with hangars, repair and reconditioning units, oil storage and distributing buildings and other field structures, at cost of more than $1,000,000 with equipment.

Seal Lock Burial Vault Co., 10-208 Ninety-fifth Avenue, Richmond Hill, L. I., will take bids for new one-story plant on Sixty-eighth Road, Forest Hills district, to cost about $45,000 with equipment. W. J. Boegel, 185 Madison Avenue, New York, is architect.

National Container Corporation, Review Avenue, Long Island City, manufacturer of corrugated paper, cardboard and other containers, has concluded arrangements for purchase of plant and business of Hygrade Eagle Corrugated Paper Products Corporation, Hunters Point Avenue and Manley Street, Long Island City, and will consolidate with latter. Expansion program will be arranged for increased output. Purchasing company will increase capital from 110,000 to 140,000 shares of stock, no par value, portion of fund to be used for acquisition and development.

General Cable Corporation, Graybar Building, New York, has purchased plant at Kingsland Avenue and Hamilton Street, Harrison, N. J., now occupied by A-A Wire Co., manufacturer of insulated wire and cables, a unit of organization, consisting of group of eight one-story units, totaling 160,000 sq. ft. floor space, and will develop as permanent plant for above unit. Property was originally built and occupied by New Jersey Tube Works.

Standard Underground Cable Co., Seventeenth and Pike Streets, Pittsburgh, unit of General Cable Corporation, has awarded general contract to Public Service Production Co., Public Service Terminal, Newark, N. J., for two-story addition to plant at Perth Amboy, N. J., to cost about $50,000 with equipment. Portion of Pittsburgh works will be removed to new structure.

Central Hudson Gas & Electric Corporation, 50 Market Street, Poughkeepsie, N. Y., has arranged for sale of block of stock to total about $7,500,000, majority of proceeds to be used for expansion and improvements, including power development and transmission line construction.

Standard Oil Co. of New Jersey, 26 Broadway, New York, has taken options on tract of about 200 acres on Staten Island, with waterfront facilities, and is said to be planning construction of new storage and distributing plant to cost $500,000 with equipment. A finishing and packing plant for petroleum products is also planned.

North Jersey District Water Supply Commission, 24 Commerce Street, Newark, will receive bids until Sept. 17, for 42 perforated copper screens and 70 galvanized steel frame shutters for Wanaque Dam water project. Morris R. Sherrerd is consulting engineer.

Eastern New Jersey Power Co., 601 Bangs Avenue, Asbury Park, N. J., has plans for two-story addition to steam-operated electric power plant at Allenhurst, N. J., to cost $200,000 with equipment. Management, Engineering & Development Co., Electric Building, Asbury Park, is architect and engineer.

Matawan Tile Co., Matawan, N. J., manufacturer of floor and wall tile prod-

ucts, plans rebuilding of portion of plant destroyed by fire, Aug. 27, with loss reported at close to $100,000, including equipment. Bennett K. Eskesen is president.

Western Electric Co., 195 Broadway, New York, has leased building at 225-239 Warren Street, Newark, N. J., totaling 47,000 sq. ft. floor space, and will remodel and equip for manufacture of precision equipment, including television and similar apparatus.

Public Service Electric & Gas Co., Public Service Terminal, Newark, has plans for new plant for manufacture of motor bus bodies on waterfront property at Sewaren, N. J., to cost $100,000 with equipment. Company will also build new steam-operated electric generating plant at same location to cost $4,000,000. Public Service Production Co., an affiliated organization, same address, will be in charge of construction work.

Philadelphia

PHILADELPHIA, Sept. 3.—Bids will be received on general contract until Sept. 15 by I. Fischman & Sons, Inc., Tenth Street and Allegheny Avenue, Philadelphia, manufacturer of soda fountain equipment, for new two and three-story plant on Erie Avenue, to occupy block front from F to G Streets, estimated to cost $1,500,000 with machinery. Clarence E. Wunder, 1520 Locust Street, is architect.

Baker Steel Co., G and Venango Streets, Philadelphia, plans rebuilding portion of machine shop at F and Atlantic Streets, destroyed by fire Aug. 27.

Reading Co., Reading Terminal, Philadelphia, has awarded general contract to Arey-Hauser Co., Elverson Building, for one-story electric car construction and repair shop, 137 x 325 ft., with lean-to extension, 25 x 119 ft., at Nineteenth Street and Wagner Avenue, Wayne Junction, to be used in connection with railroad electrification program in this district. Cost will be $300,000 with equipment. Clark Dillenback is company architect.

E. S. Dailey, 4459 Hurley Street, Philadelphia, and associates have organized Adams Foundry Co., and plan operation of local machine shop, pattern shop and foundry for manufacture of finished castings, tools, etc. James B. Clarke, 6220 Homer Street, is interested in new organization.

Pennsylvania Railroad Co., Broad Street Station, Philadelphia, has awarded contract to United Engineers & Constructors, Inc., 112 North Broad Street, for one and one-half story interlocking machine and operating building at West Philadelphia yards, estimated to cost $50,000.

John A. Roebling's Sons Co., South Broad Street, Trenton, N. J., has begun construction of one-story addition to rope shop No. 1, 240 x 315 ft., for manufacture of wire strand and wire rope. Equipment from present building will be removed to new unit and additional machinery provided for enlarged output. Work has also been started on one-story addition to plant at Roebling, N. J., near Trenton, 200 x 500 ft., to be equipped for manufacture of copper wire. Entire expansion will cost $125,000 with equipment.

Board of Education, Chambersburg, Pa., plans installation of manual training equipment in new senior high school at Third and Queen Streets, estimated to cost $280,000, for which plans are being drawn by Lawrie & Green, 821 North Third Street, Harrisburg, Pa., architects.

Pennsylvania Stamping Co., Red Lion, Pa., has taken over local one-story factory, 80 x 200 ft., formerly occupied by Red Lion Carton Co., for manufacture of patented crates and kindred products.

Board of Trustees, State Teachers' College, East Stroudsburg, Pa., C. B. Bensinger, president, State Capitol Building, Harrisburg, Pa., is having plans prepared for extensions and improvements in power plant to cost $50,000 with equipment. Davis & Lewis, Board of Trade Building, Scranton, Pa., are architects.

Penn Jersey Metal Products Corporation, Newton Avenue and Line Street, Camden, N. J., recently incorporated for $125,000, is now operating plant doing general machine work of jobbing character and manufacturing tools, dies and metal stampings. Company will be in market from time to time for machine tools and presses. William Fraser, Jr., is president and William N. Marshall secretary and treasurer.

New England

BOSTON, Sept. 3.—Local machine tool dealers report the past week quiet. The most important sale was five small tool room lathes to a Connecticut plant. Otherwise business was confined to single tools. An encouraging report is that a number of manufacturers who have contemplated buying equipment and who previously signified intentions of holding off until having opportunity to inspect machines at the national exhibit, now say they probably will make purchases before the show, owing to the fact that the delivery situation has not improved.

Pittsburgh Plate Glass Co., Pittsburgh, has plans for a warehouse at East Hartford, Conn., for which conveying equipment will be required.

United States Rubber Co., New York, is taking bids for a one-story, 300 x 100-ft. manufacturing unit at Providence, R. I. Purchase of motors and conveying equipment is contemplated.

Superior Spring & Mfg. Co., 373 Washington St., Hartford, Conn., has completed plans for a one-story, 14 x 28-ft., and two-story, 58 x 128-ft. manufacturing and storage plant.

Eastern Massachusetts Electric Co., 197A Washington St., Salem, Mass., is having plans made for a powerhouse, for which a crane will be bought.

The Whitin Machine Works, Whitinsville, Mass., has acquired the American Casablancas Co., manufacturer of spinning machinery, and will transfer production to its plants.

Nutmeg Crucible Steel Co., Branford, Conn., is planning construction of a one-story, 100 x 70-ft. foundry, to cost $20,000 without equipment.

Negotiations have been completed by Anthracite Operators Conference, 120 Broadway, New York, for purchase of controlling interest in Balanstat Corporation, Springfield, Mass., manufacturer of thermostat heat control equipment. Production is now being carried on at plant of Porter-McLeod Machine Co., Hatfield, Mass., and will be continued there temporarily. Later it is proposed to build new plant to make not only heat control, but also new forced draft equipment, another specialty of Balanstat company. George D. Roberts is treasurer.

Following recent acquisition of Lamson Oil Co., Inc., Field's Point, Providence, R. I., by Richfield Oil Corporation, purchasing company has plans for new local storage and distributing plant, with capacity of 260,000 gal., to cost $65,000 with equipment. Clinton B. Lamson is president.

Atlantic Public Utilities, Inc., Park Square Building, Boston, operating electric light and power properties in Massachusetts, Maine, New Hampshire and other States, is disposing of bond issue of $1,500,000, portion of proceeds to be used for expansion. R. W. Gilbert is president.

To provide funds for purchase of Norwalk Lock Co., Norwalk, Conn., manufacturer of locks, builders' hardware, etc., and for expansion in present facilities, Segal Lock & Hardware Co., 155 Leonard Street, New York, is arranging for increase in capital from 155,000 to 400,000 shares of stock, no par value. Increased capacity is planned.

Holo-Krome Screw Corporation, Hartford, Conn., will begin manufacture of hollow set and hollow cap screws at 80 Pliny Street, where company occupies 20,000 sq. ft. of space. Production will be 75,000 screws daily. Company will be in market regularly for chrome nickel steel. Plant will include heat treating department. W. A. Purtell is president.

South Atlantic

BALTIMORE, Sept. 3.—Baltimore & Ohio Railroad Co., Baltimore, has approved plans for a mechanical coal-handling plant at Fairmont, W. Va., to replace existing wood tipple. New unit will supply combination coal and sand service, with capacity of 300 and 100 tons of material, respectively, and will cost $50,000 with equipment. H. A. Lane is chief engineer.

Annapolis Water Co., Annapolis, Md., will receive bids until Sept. 16 for new pumping plant and filtration works for municipal water system, estimated to cost $100,000 with machinery. City will share in expense. W. C. Monroe, City Hall, is city engineer in charge.

Stonleigh Stores Corporation, 810 North Charles Street, Baltimore, Albert P. Strobel, Jr., president, is completing plans for five-story automobile service, repair and garage building, with addition of three stories underground, 190 x 194 ft., at Saratoga and St. Paul Streets, to cost $1,500,000 with equipment, William G. Nolting, Keyser Building, is architect.

Dixie Dowel Co., Winston-Salem, N. C., recently formed by R. C. Vaughn, Wachovia Bank Building, and associates with capital of $100,000, is planning operation of local plant for manufacture of dowel pins and kindred products.

Consumers Utilities Co., Winchester, Va., is said to have plans for artificial gas plant at Harrisonburg, Va., where franchise recently was granted, to cost $100,000 with high pressure distributing system, etc. Charles E. Stoddard is company engineer.

Smith-Douglas Co., Board of Trade Building, Norfolk, Va., has arranged for purchase of tract of about 10 acres on Bradley Road, near city limits of Danville, Va., and plans new commercial fertilizer plant to cost $60,000 with equipment.

West Point Power Co., West Point, Ga., has secured Federal permission for new hydro-electric power development on Chattahoochee River, at point between West Point and Franklin, with capacity of 100,000 hp. Plans will be drawn by McDonald & Co., Southeastern Trust Building, Atlanta, Ga., engineers.

De la Howe State School, Willington, S. C., is planning installation of power equipment and proposes early purchase of 25-hp. steam turbo-generator and accessory equipment.

Mica Products Corporation, Martinsville, Va., recently organized with capital of $100,000, plans extensive operation of feldspar and mica properties in Virginia and North Carolina, where the company has group of 35 mines. Grinding mills will be operated in different centers for commercial production. Executive offices will be maintained at Norfolk, Va. H. C. Field is president.

Pitcairn Aviation, Inc., Land Title Building, Philadelphia, is asking bids until Sept. 10 for hangars at Candler Field, Atlanta, Ga., to include reconditioning and repair shop facilities, etc., 150 x 250 ft., to cost $60,000 with equipment. Branch office is in Fourth National Bank Building, Atlanta, with John K. Otley in charge.

Detroit

DETROIT, Sept. 3.—Saranac Machine Co., West Main Street, Benton Harbor, Mich., has asked bids on general contract for two-story addition, to cost $27,000 with equipment. H. W. Harper, Fidelity Building, is architect.

Airparts Tool Co., Detroit, recently organized, will take over and consolidate Wayne Tool Co., 642 Catherine Street, and H. R. Krueger & Co., 439 East Fort Street, both manufacturers of production tools, jigs, dies, etc. New company plans expansion and improvement program for increased output. Joseph W. Rothmeyer, heretofore president of Wayne company, and H. R. Krueger, head of Krueger company, will continue in charge of consolidated organization.

Packard Motor Car Co., East Grand Boulevard, Detroit, has awarded contract to W. J. C. Kaufmann, 10,610 Shoemaker Street, for superstructure for addition to power plant at East Palmer and Bellevue Avenues, to cost more than $200,000 with equipment. Sessions Engineering Co., General Motors Building, is engineer.

Lake Orion Airport, Inc., Lake Orion, Mich., care of L. C. Anderson, Lake Orion, recently formed by Mr. Anderson and associates, plans construction of municipal airport, including hangar, repair and reconditioning shop and other field units, to cost $60,000 with equipment.

Mechanical Handling Systems, Inc., 3454 Denton Street, Detroit, has asked bids on general contract for one-story addition to cost $70,000 with equipment.

City Commission, Wyandotte, Mich., is considering construction of a municipal electric light and power plant.

New Orleans Fruit Co., Harrison and Water Streets, Flint, Mich., has plans for two-story cold storage and refrigerating plant to cost about $130,000 with machinery.

Highland Park Tool Co., 15 Victor Avenue, Highland Park, Detroit, is considering one-story addition to cost $30,000 with equipment. W. A. N. Pares is head.

Following recent purchase of plant of Field Body Corporation, Owosso, Mich., by Weatherproof Body Corporation, Corunna, Mich., new owner is planning for early operation as branch plant for manufacture of automobile bodies. An extension and improvement program to cost $75,000 is under way. E. C. Morine is president of Weatherproof company.

Pittsburgh

PITTSBURGH, Sept. 3.—The machinery business in this district has been rather quiet in the last two weeks as this period seems to have been the height of the vacation season. However, with the Labor Day holiday past, improvement is expected and judging by the volume of inquiry before the trade the present month should be a very active one. Tools placed recently have come from scattered sources, with individual orders predominating. However, large plants in the district have been closing regularly against their quarterly lists.

More than usual interest is attached to the heavy volume of business in heavy machinery and equipment for steel mill use which is coming to makers in this district. The American Sheet & Tin Plate Co. will soon place orders for four 4-high mills to be used at its McKeesport and Mercer, Pa., works. The H-beam mill for the new structural mill of the Illinois Steel Co. at Gary, Ind., will be built by Pittsburgh interests and orders have also been placed here recently for the equipment at the Monroe, Mich., plant of the Newton Steel Co., Youngstown. The Corrigan, McKinney Steel Co., Cleveland, is also understood to have placed a new billet mill with a local buider. Equipment for a number of large installations in the immediate Pittsburgh district, which have been mentioned previously, is still pending and the Wheeling Steel Corporation has recently announced an expansion program at its Steubenville, Ohio, works which will require considerable equipment.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has engaged John H. and Wilson C. Ely, 605 Broad Street, Newark, N. J., to prepare plans for new factory branch, storage and distributing plant on tract of land on Haynes Avenue, Newark, recently acquired, to cost $500,000 with equipment.

Pittsburgh Forgings Co., First National Bank Building, Pittsburgh, with plant at Coraopolis, Pa., has concluded arrangements for merger with Riverside Forge & Machine Co., Jackson, Mich. Both plants will be continued. Edwin Hodge, Jr., president of Pittsburgh company, will occupy same position with combined organization, and G. H. Wilkins, heretofore president of Riverside company, will be treasurer.

Cooper-Bessemer Corporation, Grove City, Pa., manufacturer of Diesel and other engines, etc., plans extensions and improvements in power plant, including installation of additional equipment, to cost $40,000.

Sylvania Products Co., Emporium, Pa., manufacturer of radio tubes and equipment, is completing new three-story addition, 80 x 200 ft., and will install equipment to give employment to about 300 additional operatives. Expansion will cost $100,000 with machinery.

Crotty & Co., Inc., Parkersburg, W. Va., is being formed with capital of $200,000 to take over and expand local plant and business of company of same name, manufacturer of oil well tools and equipment. James F. Alexander, Parkersburg, has secured controlling interest in company and will head new organization. Henry L. Crotty will continue as an official of company.

Buffalo

BUFFALO, Sept. 3.—Sterling Engine Co., 1250 Niagara Street, Buffalo, manufacturer of gas engines, parts, etc., is completing plans for two-story addition, to cost about $50,000 with equipment. F. J. and W. A. Kidd, 522 East Franklin Street, are architects.

Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, is planning early removal of plant of Thomas-Morse Aircraft Corporation, Ithaca, N. Y., manufacturer of all-metal airplanes, recently acquired, to Buffalo, where new unit will be established for this branch of production, including aircraft for military service. Present capacity will be increased. Lawrence D. Bell is vice-president of purchasing company.

McCauley Metal Products, Inc., 660 Grant Street, Buffalo, has asked bids on general contract for one-story addition, portion to be used for storage and distributing service, to cost $40,000. A. B. Meissner, 55 Tuxedo Place, is architect.

General Specialty Co., Buffalo, has been formed with capital of $30,000 to take over and expand company of same name with local plant at 65 Carroll Street manufacturing metal goods. Edward E. Gansworth is president.

Marcellus Casket Co., Van Rensselaer Street, Syracuse, N. Y., has awarded general contract to W. J. Burns Co., Keith Theater Building, for four-story addition to cost about $90,000 with equipment. M. L. King, Dennison Building, is architect.

Cleveland

CLEVELAND, Sept. 3.—While machine tool sales were rather light the past week the volume of business during last month was quite satisfactory considering that August is usually a dull month. Dealers' sales ran considerably under those in July. A slight spurt in orders last week by a local turret lathe manufacturer brought its August sales up close to those of July. Business during the week was well distributed among various industries and most orders were for single machines. While buying by the automotive industry continues light, a few orders came from automobile plants in the Michigan territory. Deliveries on most lines show only a slight improvement.

Plans are being drawn by Electric Products Co., 1725 Clarkstone Road, Cleveland, manufacturer of electrical equipment, for two-story addition, 80 x 100 ft., reported to cost about $60,000 with equipment. H. M. Morse Co., 750 Prospect Street, is architect and engineer.

Youngstown Steel Door Co., Arcade Building, Cleveland, manufacturer of steel car doors, etc., is building new plant at Youngstown, Ohio, to cost $100,000 with machinery. Company's products are now being fabricated at plant at Midland Steel Products Co., Cleveland, but all production will be concentrated at new Youngstown plant in future. Company is identified with Youngstown Sheet & Tube Co., Youngstown.

City Council, Bucyrus, Ohio, plans municipal airport, with hangar, reconditioning and repair shop and other mechanical and field units, estimated to cost about $40,000 with equipment.

Geometric Stamping Co., 121 East 131st Street, Cleveland, is said to be planning new addition, consisting of another story

on present two-story shop, to cost $40,000 with equipment.

National Bronze & Aluminum Foundry Co., East Eighty-eighth Street and Laisy Avenue, Cleveland, has plans for one-story foundry, 71 x 109 ft., to cost $50,000 with equipment.

St. Louis

ST. LOUIS, Sept. 3.—St. Louis Rust Proof Co., Broadway and Poplar Street, St. Louis, has begun work on a new two-story plant unit, totaling about 13,500 sq. ft. floor space, to be equipped for chromium plating service, to cost about $28,000 with equipment. A. C. Eckhardt is president.

Mack International Motor Truck Corporation, 2804 Pine Street, St. Louis, with headquarters at 25 Broadway, New York, has awarded a general contract to Fruin-Conlon Contracting Co., Merchants Laclede Building, for one-story factory branch, 200 x 287 ft., with assembling and service departments, on Chouteau Street, near Jefferson Avenue, St. Louis, to cost about $230,000 with equipment. H. E. Foster, 400 West Madison Street, Chicago, is architect and engineer.

Mexica Refractories Co., Mexico, Mo., has preliminary plans under way for new plant for manufacture of fire brick and refractory shapes, reported to cost about $50,000 with equipment. J. B. Arthur is president.

City Council, Russellville, Ark., has approved plans for a municipal electric light and power plant, and will arrange fund at early date of $245,000 for construction and equipment, including distributing system. W. L. Winters, Merchants Bank Building, Fort Smith, Ark., is engineer.

City Council, Little Rock, Ark., has been authorized by public vote to arrange bond issue of $200,000 for municipal airport, including hangars, repair and reconditioning shops, oil storage and distributing building, and other field units. City engineer in charge.

Cincinnati

CINCINNATI, Sept. 3.—Demand for machine tools during August, while not up to the high level of July, was unusually good for this period of the year. Bookings during the last week, however, were in better volume than during the preceding week and added further to the large quantity of unfilled orders now on file. This steady demand throughout the summer has been substantial rather than sensational, orders generally being for one or two machines. Local builders of machine tools have maintained capacity production throughout the summer months. Despite this continued factory activity, deliveries are extended, and three to four months is about the best that can be promised. Inquiries reflect the continued healthy interest of buyers both in replacements and new equipment. While domestic business has been brisk, foreign business has been lagging. Word from two Russian commissions, which received quotations from several local manufacturers, is being awaited, but so far only requests for further information have been received.

Contract has been let by Royal Blue Bed Spring Co., 3274 Beekman Street, Cincinnati, to H. C. Hazen Contracting Co., 2070 Reading Road, for extensions and improvements in factory unit at 2549 Cummins Street, to cost about $38,000. W. O. Lathrop is head.

Commerce Garage Co., Chamber of Commerce Building, Cincinnati, has filed plans for a seven-story service, repair and garage building, 60 x 190 ft., on Race Street, to cost close to $300,000 with equipment.

Eagle Engineering Co., Springfield, Ohio, manufacturer of special machinery, parts, etc., is said to be planning one-story addition on adjoining site, 160 x 180 ft., on West Main Street, reported to cost more than $45,000 with equipment.

Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, will soon break ground for a one-story addition to plant at Maryville, Tenn., 45 x 490 ft., to cost more than $125,000 with equipment.

Advance Battery Co., 227 East Lee Street, Louisville, has begun superstructure for a new one-story addition, to cost about $20,000 with equipment.

United Welding Co., Middletown, Ohio, has plans for a new one-story addition to cost $25,000 with equipment.

Quartermaster, Construction Department, Air Corps, United States Army, Wright Field, Dayton, Ohio, has plans under way for a one-story mechanical and repair shop to cost about $250,000 with equipment.

Chicago

CHICAGO, Sept. 3.—August fell little short of July in machine tool bookings and was within striking distance of June and May. An important factor contributing to the past month's business in this district was the buying of equipment for the Farmall tractor plant of the International Harvester Co., at Rock Island, Ill. Orders for most of the special purpose tools have now been placed and purchases of standard machines are approaching completion, with the buying of tool room equipment still to be done. The purchasing program now being concluded is expected to raise the output of the Farmall plant to 200 tractors a day. In view of steadily expanding demand, it is intimated that still further expansion of capacity is now being considered.

Although there have been no other outstanding machine tool lists before the trade during the month, business from miscellaneous sources has been consistently in good volume. In some cases orders have been referred until after the impending machine tool show at Cleveland, and vacations have also been a factor in slowing up buying, but withal aggregate business booked by local distributers has been far above normal for the summer season. Evidences of tapering industrial operations are not lacking, but there have been partially offsetting increases in activity also, with the consequence that the net letup has been small.

Sellers point out that the most important incentive for machine tool buying—the high cost of labor—is, to a large extent, independent of passing fluctuations in industrial activity. Metal working shops generally are alert to the necessity for cutting all possible corners to reduce their cost burden and realize that the replacement of obsolete or obsolescent equipment is in the interests of real economy.

Used tools are no longer serious competitors of new equipment. In fact, good used tools are scarce.

Machine tool deliveries have shown slight improvement, but are still very much extended.

Business prospects for this month have been brightened by the inauguration of purchases by the Continental Motors Corporation, Muskegon, Mich., which has not been an important buyer for a considerable period. There are also indications that added business will come from automobile manufacturers in the Central West.

Tool and die shops are exceptionally busy and are consistent buyers in the Chicago market. The Western Electric Co. is farming out less work in connection with the manufacture of sound-moving picture apparatus, indicating that its own production in this field is getting into full swing.

The Rock Island is inquiring for a 5-ft. universal radial drill for delivery at Horton, Kan. Other Western railroads show little interest in machine tools except for the preparation of preliminary figures for 1930 budgets. It is still too early to estimate the probable outlays of the railroads for equipment.

A number of large lists are in prospect for public schools on the west side of Chicago, the program for one school alone calling for 50 engine lathes. No action on this equipment can be looked for, however, until the city's finances are straightened out.

Reports vary as to collections, but on the whole it appears that obligations are being met satisfactorily.

Crane builders are heavily engaged; one leading company is booked so far ahead that it is virtually out of the market.

Western Clock Co., Buffalo Street, Peru, Ill., has awarded general contract to Jobst & Sons, Lehman Building, Peoria, Ill., for four-story addition to be used for parts production and assembling, to cost $200,000 with equipment. A. S. Goodenough is engineer

Ora-Tone Radio Co., 1010 George Street, Chicago, manufacturer of radio equipment, plans replacement of portion of plant recently destroyed by fire with loss of $40,000, including equipment.

Lyon Metal Products Co., Montgomery Street, Aurora, Ill., has awarded contract to Sumner-Sollitt Co., 307 North Michigan Avenue, Chicago, for one-story addition to power plant, to cost $70,000 with equipment. Frank D. Chase, Inc., 720 North Michigan Avenue, Chicago, is architect and engineer.

Chicago Steel Tank Co., 6400 West Sixty-sixth Street, Chicago, has filed plans for one-story addition, 120 x 200 ft., designed to increase capacity about 40 per cent, particularly in connection with steel tanks for oil burner installations. Cost will be $125,000 with equipment. Foltz & Co., 510 North Dearborn Street, are architects.

Central West Public Service Co., 117 North Thirteenth Street, Omaha, Neb., is planning enlargements in steam-operated electric generating plant at Woonsocket, S. D., including installation of equipment to double present capacity, at cost of $90,000.

International Harvester Co. of America, Inc., 606 South Michigan Avenue, Chicago, is planning one and two-story factory branch, storage and distributing plant at Grand Forks, N. D., to cost $60,000 with equipment. W. D. Price is construction superintendent.

City Council, Cedar Rapids, Iowa, is planning municipal airport, including hangars, repair and reconditioning shops, oil storage and distributing buildings and other units, to cost $180,000 with equipment. A special election has been called on Sept. 12, to approve bonds to finance the project.

Board of Education, Administration Building, Denver, Colo., plans installation of manual training equipment in new high school at Mariposa Street and Forty-first Avenue, to cost $500,000, for which plans will be drawn by T. H. Buell & Co., United States National Bank Building, architects.

Ruth Automatic Garage, Inc., 38 South Dearborn Street, Chicago, has awarded general contract to J. B. French Co., 30 North Michigan Avenue, for 28-story service, repair and garage building at 329-335 Plymouth Court, to cost $1,000,000 with equipment. A. S. Graven, Inc., 100 North La Salle Street, is architect.

Milwaukee

MILWAUKEE, Sept. 3.—Easier tendencies have not been as marked in machine tools as had been anticipated, but some dealers report that demand has fallen off, while others find the previous high level is maintained. Inquiries for September are showing surprising volume, with more than the expected amount coming from the automotive industry. Nearby automobile manufacturers plan resumption of large production within several weeks following a pronounced lull. Leading manufacturers in almost all lines continue production at capacity. Jobbing machine shops have all the work they can handle, but tool and die makers report the decline normal at this time. Woodworking plants are experiencing a spurt of activity.

Simmons Co., New York, is starting construction of addition to plant at Kenosha, Wis., to cost at least $100,000 for production of "Zalmite," newly perfected base for furniture metal composed of products formerly wasted. Foundations contemplate eventual erection of six-story building, but one story and basement only are to be erected at present.

Wisconsin Ornamental Iron & Bronze Co., 1665 Booth Street, Milwaukee, recently merged with General Bronze Co., Long Island City, N. Y., has let general contract to S. M. Siesel Co., 160 Ogden Avenue, Milwaukee, for one-story addition to brass foundry, 75 x 116 ft., to cost about $40,000 with equipment. E. A. Ernest is president.

City of Sheboygan, Wis., announces low bidder for construction of buildings and structures for new municipal filtration plant is Verhulst Co., Inc., Calumet Drive, Sheboygan, at $251,000, but equipment bids although opened have not been disclosed. Total authorized fund for plant is $750,000. Alvord, Burdick & Crawford, Chicago, and Jerry Donahue Engineering Co., Sheboygan, are the engineers.

City Council, Chilton, Wis., has authorized sale of $215,000 bond issue to purchase local plant of Oconto Waterworks Co. Proposed improvements include deep well pump with electric drive and standpipe at estimated cost of $35,000 to $38,000. Gordon & Bulot, 53 West Jackson Boulevard, Chicago, are engineers.

Royal Airways Corporation, 614 East Gorham Street, Madison, Wis., is ready for bids on airplane hangar of stucco and tile on steel framework, 100 x 130 ft., including service shop, at Pennco field. E. N. Quinn is president and general manager and Flad & Moulton, Washington St., Madison, are architects.

Northern Engraving Co., LaCrosse, Wis., has let contracts to F. R. Scwalbe & Sons, LaCrosse, for addition to plant producing automobile dash boards and art metal products, one-story, 100 x 200 ft. P. M. Gellatt is president.

The Crane Market

INQUIRY for cranes has been light, but with Labor Day past a continuation of buying activity is expected. The United States Meals Refining Co., Cartaret, N. J., has closed on a list of fourteen overhead cranes for Canada with the Dominion Bridge Co. The New York Central Railroad is in the market for two 25-ton locomotive cranes, and the Mitsubishi Shoji Kaisha, 120 Broadway, New York, has been taking bids on one locomotive crane for export to Japan.

Among recent purchases are:

United States Metals Refining Co., Cartaret, N. J., fourteen 10-ton overhead traveling cranes for Copper Cliffs, Ont., from Dominion Bridge Co.

Foundation Co., 120 Liberty Street, New York, two 15-ton electric traveling cranes for Chicago, Milwaukee & St. Paul Railroad from Milwaukee Electric Crane & Mfg. Corporation.

Raymond Concrete Pile Co., 140 Cedar Street, New York, 30-ton locomotive crane from Ohio Locomotive Crane Co.

David Ripley & Sons and Frank W. Hopping, Newark, N. J., 7½-ton crawl-tread crane from Browning Crane Co.

Walsh Construction Co., Syracuse, N. Y., 30-ton locomotive crane from Browning Crane Co.

C. V. Dandignac, Port Richmond, S. I., New York, 7½-ton truck crane from Browning Crane Co.

Goodman Mfg. Co., Chicago, 10-ton, 21-ft. span, 3-motor, overhead traveling crane from unnamed builder.

Illinois Steel Co., Joilet, Ill., 10-ton, 62-ft. span, 4-motor, overhead crane from Milwaukee Electric Crane & Mfg. Corporation.

Emerson Brantingham Co., Rockford, Ill., 3-ton, 3-motor, overhead crane from unnamed builder.

Indiana

INDIANAPOLIS, Sept. 3.—Following recent acquisition of Allison Engineering Co., Main and Thirteenth Streets, Indianapolis, manufacturer of gas engines, etc., by General Motors Corporation, General Motors Building, Detroit, site is being cleared preparatory to construction of new plant units, for which plans are in progress. Works will be used for production of aircraft motors. An expansion plan is to be carried out by new owner during next 12 to 18 months to cost more than $400,000 with equipment. N. H. Gilman is president.

Edwards Iron Works, 2101 South Main Street, South Bend, Ind., has awarded general contract to Charles A. Jordan Co., 725 Wilber Street, for one-story addition, 200 x 325 ft., to cost about $85,000 with equipment.

Warner Gear Co., Muncie, Ind., a division of Borg-Warner Corporation, manufacturer of automobile gears, etc., is completing a new one-story unit to be equipped for about 30 per cent increase in present capacity, estimated to cost about $1,000,000 with machinery. C. S. Davis is president of parent organization.

W. W. Ahlschlager, 65 East Huron Street, Chicago, architect, has plans under way for multi-story automobile service, repair and garage building at Ohio and Illinois Streets, Indianapolis, reported to cost close to $900,000 with equipment.

Reynolds Regulator Co., 1520 Lincoln Street, Anderson, Ind., is said to be planning one-story addition to cost about $35,000 with equipment.

Northern Indiana Public Service Co., Hammond, Ind., is planning four-story electric-operated pumping plant at Long Beach, Ind., reported to cost more than $75,000 with equipment. L. C. Bernard, First Trust and Savings Bank Building, Hammond, is architect; A. P. Melton, 504 Broadway, Gary, Ind., is engineer.

Gulf States

BIRMINGHAM, Sept. 3.—Houston Armature Works, Inc., Preston Avenue, Houston, Tex., is planning new one-story electrical equipment plant on site lately acquired at Broadway and Prairie Avenue, to be one-story, to cost about $45,000 with equipment. A. C. Kater is president.

Texas-Louisiana Power Co., Fort Worth Club Building, Fort Worth, Tex., has approved plans for immediate construction of addition to steam-operated electric generating plant at Pecos, Tex., estimated to cost $200,000 including transmission line extensions.

Galveston Wharf Co., Galveston, Tex., has filed plans for new grain elevator, 230 ft. high, with capacity of 6,000,000 bushels, to include conveying, elevating, screening and other equipment, estimated to cost $1,500,000.

McWane Cast Iron Pipe Co., 3700 North Eleventh Avenue, Birmingham, Ala., has awarded general contract to A. F. Felix, 2119 North First Avenue, for one-story and basement addition, 40 x 100 ft., to cost about $40,000 with equipment. Miller & Martin, Title Guarantee Building, are architects.

Southern Air Transport System, Fort Worth, Tex., has plans nearing completion for hangar at Love Field, Dallas, Tex., consisting of two bays, 110 ft. and 90 ft. respectively, with repair and reconditioning shops in rear, estimated to cost about $85,000 with equipment.

Board of Education, Greenville, Miss., is planning installation of manual training department in new two-story E. E. Bass junior high school, estimated to cost $200,000, for which bids will be received on general contract on Sept. 17. N. W. Overstreet, Fire Insurance Building, Jackson, Miss., is architect.

Port of Corpus Christi, Corpus Christi, Tex., plans installation of conveying, elevating and other mechanical-handling equipment at new loading terminal, estimated to cost $300,000, for which fund has been arranged. Structure will be occupied under lease by Duval Texas Sulphur Co., Corpus Christi.

Pacific Coast

SAN FRANCISCO, Aug. 29. — Contract has been let by Southern Pacific Railway Co., Los Angeles, to Robert McKee, 515 Hewitt Street, for group of locomotive repair shops on San Fernando Road, consisting of engine house, machine shop, 73 x 225 ft.; power house, 50 x 54 ft.; and six other one-story units, to cost $350,000 with equipment. Engineering department of company is in charge.

Los Angeles Engine Works, Inc., Los Angeles, has awarded general contract to Ted R. Cooper Co., Western Pacific Building, for one-story plant, 50 x 140 ft., on Turner Street, to cost $50,000 with equipment.

Board of County Supervisors, Hall of Records, Los Angeles, is asking bids until Sept. 10 for a 300 kva. generator set for the Los Angeles general hospital.

Standard Auto Body Co., Fifteenth Street and Central Avenue, Los Angeles, has awarded general contract to Jergesen & Dequine, 1316 Paloma Avenue, for one-story addition, 100 x 150 ft., to cost $65,000 with equipment. Richard D. King, Van Nuys Building, is architect.

Charles W. Ertz, Pittock Block, Portland, Ore., architect, will soon take bids on general contract for two-story automobile service, repair and garage building, at Burnside and Thirteenth Streets, 200 x 200 ft., to cost $150,000 with equipment.

Olympic Forest Products Co., Port Angeles, Wash., is perfecting plans for new local pulp mill in conjunction with saw mill. The first noted will have a capacity of about 150 tons per day, to be tripled at later date. The saw mill will be equipped for output of 1,000,000 ft. per month. Entire project will cost $1,000,000 with machinery.

Spring Street Iron Works, Klamath Falls, Ore., is considering rebuilding portion of plant recently destroyed by fire with loss of $70,000 with equipment.

Compton Union High School, Compton, Cal., plans construction of manual training shops at proposed new junior high school group in Haynes-Clearwater district, estimated to cost $100,000. Frank M. Goodwin, Stockwell Building, Compton, is architect.

Dabney-Mills Alloys Corporation, Long Beach, Cal., has been formed to manufac ture and sell diamond substitute and hard facing metals in the oil and other industries. Factory at 3454 Pine Avenue and sales office and warehouse at 3508 Atlantic Avenue are in operation. Company will be regular user of ferrotungsten, ferrochromium, ferrosilicon and nickel shot. F. R. Shumack is purchasing agent.

Canada

TORONTO, Ont., Sept. 3.—While most machine tool orders are for one or two tools each, buying in general is fairly extensive because of heavy replacement needs. Many small lists are appearing with the result that builders and distributers are looking for a brisk fall demand. The display of tools and machinery at the Canadian National Exhibition, being held in Toronto, is also a factor toward betterment in machine tool sales. The automotive industry and railways are buying regularly for replacement purposes, but orders for new plant equipment are somewhat limited.

Swansea, Ont., will build two sewage pumping stations on Queen Street, for which bids are being received by N. L. Ivey, 107 Runnymede Road, Toronto. Equipment will be purchased.

Bids are being taken for a $300,000 factory at Longueuil, Que., for Fairchild Aircraft, Ltd., 1253 McGill College Avenue, Montreal, Que. W. H. Wardell, 1463 Union Avenue, Montreal, is consulting engineer. The main building will be 140 x 260 feet.

Plans are being prepared by James, Proctor & Redfern, Ltd., 36 Toronto Street, Toronto, for the erection of a one-story brick and steel factory addition to plant of Sieberling Rubber Co. of Canada, Ltd., at 99 Paton Road, Toronto. Cost is estimated at $25,000.

The Hull Match Co., Montreal, has awarded general contract to A. F. Byers & Co., 1226 University Street, Montreal, for a factory on Montclair Boulevard, Perry & Luke, 1190 University Street, Montreal, are architects.

Dominion Bridge Co., Vancouver, B. C., has plans for construction of $1,000,000 plant.

Hayes Wheel & Forgings of Canada, Ltd., Merriton, Ont., has awarded general contract to E. P. Muntz, Ltd., Temple Building, Toronto, for machine shop to cost $100,000. H. G. Acres & Co., Ferry Street, Niagara Falls, Ont., are consulting engineers.

Foreign

IN connection with development of motor truck body manufacturing facilities, including extensions in Amo works at Moscow, Soviet Russian Government, Moscow, is planning purchase of machine tools, bench tools, woodworking machinery and other mechanical equipment in United States, through Amtorg Trading Corporation, 261 Fifth Avenue, New York, official buying agency for Soviet Union. The Amo plant will be developed for a capacity of 25,000 2-ton trucks per year, while plants at Yaroslav and Spartalk will be equipped for gross production of 1000 heavy truck units and 2500 light trucks a year respectively. Arrangements have been concluded with Hercules Motor Corporation, Canton, Ohio, manufacturer of gasoline motors of heavy type, for technical assistance in establishment of division at Yaroslav works for production of units of this kind.

Director of Aviation, Department of War, Sanitago, Chile, is selecting site and will prepare plans for establishment of civil airport, including hangars, repair and reconditioning shops, oil storage and distributing buildings, and other field units. Entire project will cost $500,000.

Following recent organization of Andrews Toledo, Ltd., Sheffield, England, to take over local plant and business of Jno. Hy. Andrews & Co., Ltd., manufacturer of drill and tool steels, steel rods, etc., new company is planning for complete modernization of works, including installation of additional equipment for increased output. Property will be transferred early in November. J. F. Parker is chairman of board of new organization.

New Trade Publications

Steel Strips for Cement Floors.—Lockstrip Mfg. Corporation, Long Island City, N. Y. Several new brochures on Lockstrip for cement floors to supplant scoring, form an expansion joint and flush finish surface, have been published.

Motor Control Equipment.—Electric Controller & Mfg. Co., Cleveland. A four-page pamphlet relates the advantages of using the company's motor starters and automatic compensators.

Large Vertical Motors. — Wagner Electric Corporation, St. Louis. A new bulletin, No. 159, has been issued, covering all types of large vertical motors, in ratings of from 1½ to 30 hp. As illustrated by diagrams in the bulletin, a feature of the motors is that they all have the same flange or lug dimensions, making it possible for manufacturers and users of small motor-driven machinery to interchange motors of different types and ratings on the same mounting dimension.

Switchboard Meters.—Sangamo Electric Co., Springfield, Ill. An addenda to bulletin No. 73 describes Sangamo type HN a.c. switchboard meters.

Boiler Feed Control.—Northern Equipment Co., Erie, Pa. Catalog of 16 pages, illustrating and describing the Copes system of boiler feed control, showing methods of attachment and some of the records taken from instrument charts. The actuating element is a thermostat.

Fire-Fighting Equipment.—American LaFrance & Foamite Corporation, Elmira, N. Y. A 176-page catalog, which contains complete listings and descriptions of portable fire-fighting equipment, is virtually a text book on the subject of fire apparatus. The catalog is divided into eight sections and has a comprehensive index.

Electric Steel Castings.—Belle City Malleable Iron Co., Racine, Wis. A new 20-page, 6 x 9 booklet on the application and production of basic electric steel castings, besides showing and describing the facilities for the making of electric steel castings, gives many pointers on the effective use of steel castings, illustrated by actual examples. Details of the problems are given to facilitate the use of these ideas on other products and by other manufacturers.

Steel Castings.—Lebanon Steel Foundry, Lebanon, Pa. Bulletin No. 19 of two pages, entitled "Controlling Production," illustrated, is another of a series in the story of Lebanon electric furnace steel castings. It discusses the system used by this company in keeping track of and controlling the many varieties of castings which are constantly being produced.

Steel Castings.—Nugent Steel Casting Co., Chicago. Bulletin No. 119 of two pages, illustrated, is entitled "Improving an Age-Old Product." It discusses how the company makes the same metal into a better swivel than used to be produced and saves the manufacturer one operation.

Electric Heat in Industry. Public Service Co. of Northern Illinois, Chicago. Brochure of photographs of installations of electric furnaces for steel melting, heat treating, baking various products and for cooking.

THE IRON AGE

New York, September 12, 1929

ESTABLISHED 1855 VOL. 124, No. 11

Lacquer Department Conveyorized

Studebaker Doubles Output, Saves 15 Per Cent on Labor and Reduces Rejections 25 Per Cent by Installing New System

BY BURNHAM FINNEY*

WHEN the Studebaker Corporation decided recently to concentrate all manufacturing activities at South Bend, Ind., it was faced with the necessity of greatly increasing its output there to take care of the volume of automobiles formerly made at Detroit. Instead of constructing additional units at a high cost, it examined ways and means by which operations might be carried on more intensively in its present buildings, and finally decided to install an extensive mechanical conveying system reaching into many departments.

The conveyorizing of the lacquer department was included in the expansion program. By means of the new system, production of hoods in the department has been increased from 400 to 800 in a 10-hr. day and the output of sets of sheet metal parts has mounted from 125 to 350 in the same working period. Concurrently, labor saving has amounted to 15 per cent and rejections have declined 25 per cent.

*THE IRON AGE, New York.

HOODS Are Carried Through All Operations in Department on Overhead Chain Conveyor

Sheet metal parts going through the lacquer department consist of the running board splash apron, radiator splash apron, fenders, gas tank covers and hoods. They are brought from final inspection in the stamping department to the lacquer department on an overhead chain conveyor and there are transferred by hand by two men to another overhead chain conveyor. The department is served by two conveyor lines, one for hoods and one for other parts. Both conveyors are constructed of 4-in. I-beams with steel angle supports. Running on the I-beams are two-wheel trolleys with standard H attachments connected by No. 458 drop forged chain.

As they move along the conveyor line, the running board splash aprons, radiator splash aprons, fenders and gas tank covers (hereafter referred to as the "fender line") are cleaned with Rex Pamco Reducer to remove spots and are sprayed with Rex Pamco Cleaner to take off all grease and slight rust from previous handling. The spraying booth is an individual unit with an air-agitated pressure tank located outside the booth. The cleaner is forced by air through two hose into the booth, where a workman sprays it on the sheet metal parts.

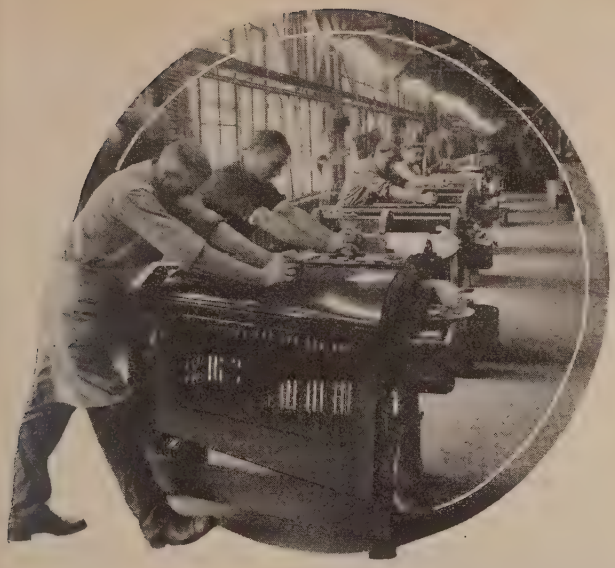
Fenders Baked in Drying Oven

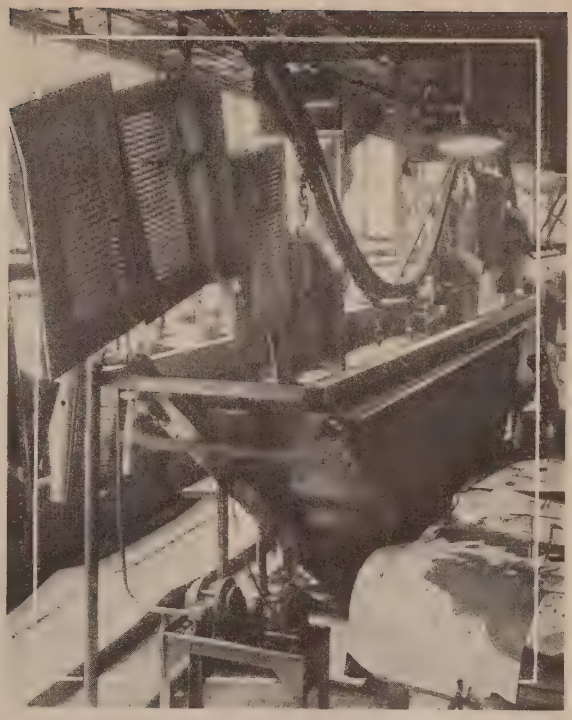
Passing out of the spray booth on the conveyor, fenders are air-dried while moving toward the drying oven, where they are baked from 20 to 30 min. at 400 deg. Fahr. This oven, manufactured by Young Brothers Co., Detroit, is of standard panel design, with the oil heating unit situated in a pent house on the roof of the building. Heat is forced through ducts from the heating unit to the oven and is drawn out there by means of exhaust fans.

In the oven the Rex cleaner flakes on the fenders, so that the first operation after emerging from the oven is the scuffing off of this material. This is done by rubbing the fenders by hand with steel wool, after which they are wiped down with an alcohol cloth to make sure that no rust has accumulated. For spraying the prime coat, fenders are carried through a booth in which the Floco system of automatic shower bath is used. This booth contains a series of shower spray heads, some of which are turned upward and some downward, so that all parts of the fenders have the spray of paint turned directly on them. The spray heads are adjustable to suit local conditions. A number of drain pans form the floor of the booth. Through these pans the paint returns to the storage tank, where it is ready to be pumped again into the Floco system.

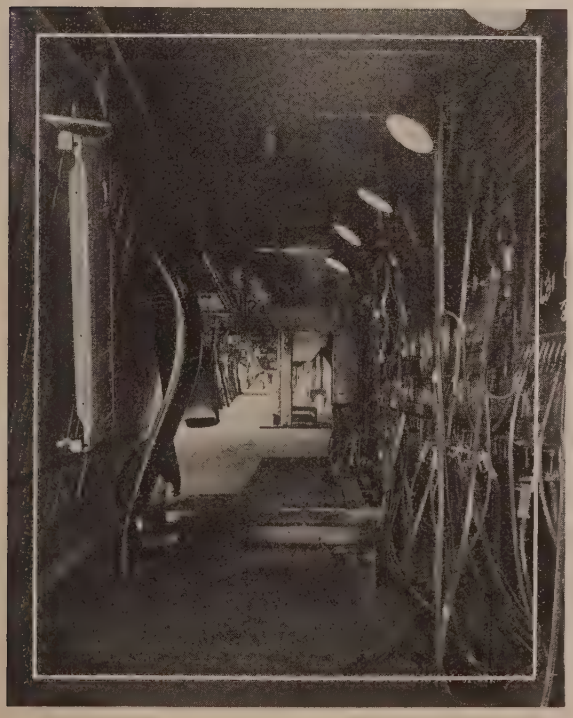
The supply tank for the Floco system is located in a service elevator tower on the third floor. From this tank the material is pumped to a second supply tank, in the sawtooth of the fourth floor, which is of small capacity

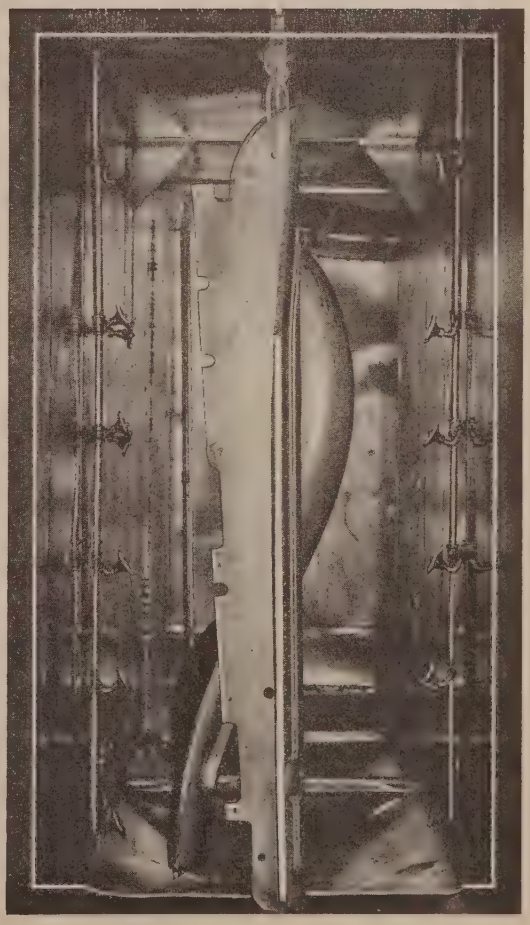
AFTER Hinges, Corner Pads and Handles of Hoods Have Been Assembled and Riveted, Hoods Are Put on Special Slat Conveyors Where They Are Striped with a Striping Pencil (Bottom). The striping operation is shown above





AFTER the Lacquering Operation, Sheet Metal Parts Are Taken from Conveyor, Put on Special Rubbing Bucks and Rubbed Down by Hand with Oil, Pumice Stone and Water (Upper Left). Hoods are dipped in a tank for the priming coat, the paint in the tank being specially agitated at the top and bottom (upper right). Booth in which Rex Pamco cleaner is sprayed on fenders and other parts is individual unit with air agitated pressure tank located outside booth. Cleaner is forced by air through two hose into booth (lower left). Prime coat is sprayed on fenders by Floco System of automatic shower bath (lower right). Booth contains series of adjustable shower spray heads. Several drain pans form the floor of the booth





and is designed to keep the pump constantly primed, thus giving to the spray heads a proper pressure.

Fenders Pass Along Conveyor Bank

Coming out of the Floco booth, fenders pass along a considerable bank in the conveyor for dripping purposes. The bank is in a special glass-inclosed room, offering protection against dust and dirt, where the floor is made up of a series of drip pans. From this room the conveyor leads into a drying oven, where the prime coat is baked on for a period of 2 hr. at a temperature ranging from 370 to 400 deg. Fahr. Coming from the oven, the fenders are cooled for 5 min. and then are lightly sanded. From this point they start a journey through a number of spray booths and drying ovens, during which they are sprayed outside with from six to eight coats of lacquer, are air-dried for 10 min. between each coat, and are oven-dried for 45 min. at 170 deg. Fahr. They are water-sanded, mist-coated and retouched. They are then sprayed inside with black paint, again oven-dried for 45 min. at 170 deg. Fahr., removed from the conveyor for a Parko-Rub, and polished. After being polished, they are hung on a conveyor and are delivered to the final car assembly line, passing en route through a finished stockroom, where they can be removed for storage, if desired.

Hoods go through a similar process, except that they are dipped in a tank for the priming coat, the paint in the tank being specially agitated at the top and bottom. Moreover, after polishing operations, hoods are sent by overhead conveyor to the assembly department, where hinges, corner pads, and handles are assembled and riveted. They are then put on a slat conveyor on which they are striped with a striping pencil. Finally the two halves of each hood are assembled and are placed on an overhead I-beam conveyor to be delivered to the final car assembly line.

Ovens Are Constructed of Wood

Ovens in which lacquer coats are dried are economically constructed of wood framework with plaster board sides. Since the temperature of the oven never exceeds approximately 170 deg. Fahr., the use of such material is feasible.

After the coat has been thoroughly dried, following the lacquer spraying operation, sheet metal parts are taken from the conveyors by hand and are put on special rubbing bucks. Here they are rubbed down by hand with oil, pumice stone and water. Under each rubbing buck is a drain to carry away the drip or splash of the liquid.

The floor of the spraying booths is a mastic deck with drains connected to a sewer. The mastic deck is composed of material similar to asphalt, which is laid on top of the original cement floor of the booth. With this construction it is possible to wash booths with water and a lacquer remover about twice a week to keep them from collecting a thick layer of lacquer dust. For use in case of fire, booths are equipped with automatic sprinkling heads. In addition, there are two sprinkler heads in the exhaust stack of each booth.

At various points along the conveyor line, and also after final inspection, are repair stations where any work that is scratched or otherwise marred can be removed and put through a special process to restore its original appearance.

The fender painting conveyor is 4608 ft. long and is driven by one 5-hp. motor operating at 1200 r.p.m., with a dual caterpillar drive. The motor is connected to a Reeves Class 1, Type E variable-speed drive, which in turn drives two Jones No. 15 double-type reducers from a common shaft. The ratio of the reducers is 44 to 1. This in turn drives bevel gears directly connected with spur gears with a shear pin coupling to chain sprockets.

COMING Out of Floco Booth, Fenders Pass Along Bank in Conveyor for Dripping Purposes. Bank is in glass-inclosed room the floor of which consists of a series of drip pans

The entire conveying system in the department was designed and installed by the Jervis B. Webb Co., Detroit. The special conveyor for the striping of hoods was supplied by the Chain Belt Co., Milwaukee, and the lacquer mixing equipment is the product of the Binks Spray Equipment Co., Chicago.

For instrument boards, garnish molding and door-panel units, the layout had to be made so that parts could be run in grain, or lacquer or metallic enamel. This was made possible by using the same combination ground color and primer for both lacquer and grain. Complete car sets are obtained within a 3-hr. period. Parts are delivered to the final body assembly line by an overhead I-Beam conveyor carrying crates, each of which contains a complete set of garnish moldings, door panels and instrument board for one car. The layout utilizes 3166 ft. of conveyor, and in 32,248 sq. ft. of floor space 4875 garnish moldings, 2700 garnish door panels and 800 instrument boards are produced in a 10-hr. day, with a production increase of 200 per cent and a cost reduction of 35 per cent.

Uses Universal Heat-Treating Unit

Packard Plant Has Three Furnaces, with Pushers and Pullers Interconnected with Time Controls, Forming One Continuous and Automatic Outfit

BY F. W. MANKER

THREE large furnaces and a quench tank, set in a straight line in series, so that the work can pass progressively through each in turn, have been put into operation by the Packard Motor Co., Detroit.

Inter-connected conveyors and automatic temperature controls make this unit continuous and automatic in operation. It can be adjusted for four operations at once—such as normalizing, heating for hardening, quenching and drawing—or it can be divided up so that one class of work can be annealed or normalized while another is being hardened and drawn.

By altering the time cycles and temperatures of the various units, all sizes of work, from small forgings up to large axles, can be treated interchangeably. Parts being treated regularly in this installation include front and rear axles, connecting rods, transmission gears, differential driving pinions, steering knuckles, steering knuckle levers, etc. That, this range in size is possible is due to the fact that a standard grid-type tray, of alloy steel and 14 in. wide, is used to carry the work through the furnaces.

Only two operators are employed, one to load the work on the trays at the charging end of the first furnace and the other to reload as the work comes out of the

COMPARISON of Heat-Treating Costs (Right) by the Continuous Method with Previous Costs Shows the Advantage of the Former at All Except a Very Low Production Rate

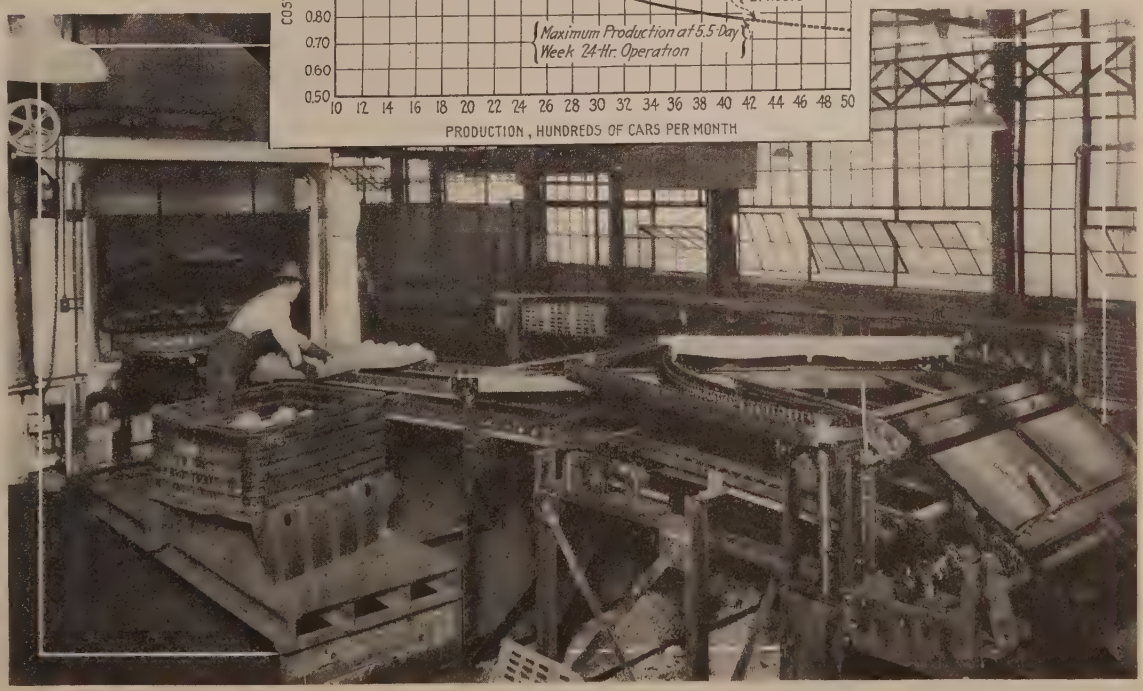
CHARGING End of Normalizing Furnace (Below). At right is the conveyor which brings returning trays to the correct position and drops them to the gravity conveyor which feeds them to the charging table



quench to go through the drawing furnace. The trays are returned, oriented automatically and passed into the first furnace again without further attention.

Packard engineers developed the conveyor system at either end, as well as that between the hardening and drawing furnaces. The furnaces and the remainder of the conveyor system were designed and built by the Surface Combustion Co., Toledo, Ohio. These furnace walls are made of 9 in. of firebrick and 9 in. of insulation and are held together with buckstays.

In cross section each furnace is 6.5 ft. wide and 3.2 ft. high. The first is 22 ft. long and the others 25 ft. The first furnace has eight gas burners close to the discharge end, as this is the most critical point of the heat treating cycle. These fire directly into the heating chamber. At the discharge end are two oil burners firing into tunnels, running the length of the furnace under the hearth, and

with which the pusher operates, and this in turn is controlled by a Stromberg time clock.

At the discharge end a mechanical puller reaches into the furnace, engages the trunnions of the trays and pulls them forward. This is operated by the same time clock, in series with a relay to correct for the time lag between the two movements. The puller is used because it was not found practicable to put all the load on the pusher.

Work which is to be normalized only is automatically dumped, after passing through the normalizing furnace, on to the normalizing cooling conveyor, pan type. This carries it along and then automatically discharges it, in about an hour, into tote boxes. The trays continue on, so as not to interrupt the cycle for other work. The transfer is made through a chute which drops the work directly on to the normalizing cooling conveyor. To get sufficient clearance for a gravity drop the receiving end of

OUTLET End of Hardening Furnace, at Right Side of Picture, with Quench Tank Below and Pass-over Conveyor Above It. The slat conveyor for bringing parts up from the quench is at lower left corner

discharging their products of combustion through numerous ports.

By dividing the furnace into three zones—preheating, heating and soaking—a proper heat gradient is obtained. Automatic temperature control is located in each zone and recording pyrometers are provided. Hot gases pass along toward the charging end, giving off their heat to the cold incoming work, moving in the opposite direction, thereby insuring efficient operation.

Waste heat from each furnace is discharged through a vent in the roof, close to the charging end. In the vent is a recuperator. Fresh air for combustion is forced through the coil in this recuperator, heated to some 600 deg. Fahr. and then delivered to the burners.

Inspirators at the gas burners regulate the gas-air ratio. Thus a reducing, neutral or oxidizing atmosphere can be obtained at will, and automatically maintained.

Trays of work are pushed through, by a mechanical pusher, on three alloy-steel rails. This pusher is motor driven, through a bell-crank link drive. The time the work is in the furnace is controlled through the frequency

this conveyor commences at a point below the floor. It may be seen coming up through the floor in one illustration.

If, on the other hand, hardening is to follow, the trays travel along the conveyor which bridges the gap between the two furnaces, and into the hardening furnace. This roller conveyor is 22 ft. long, this distance giving the work the proper cooling before it enters the hardening furnace.

As with the normalizing furnace, the hardening furnace is divided into three heating zones, automatically controlled as to temperature. There are the same type pusher and puller. This furnace has ten gas burners and two oil burners, operating as in the normalizing furnace. At the discharge end the work is dumped through a chute into a quench tank. As in the normalizing furnace, any desired heat gradient can be maintained.

Dumping is done in a unique manner. The trays have a trunnion at each end, on the advancing side, but are supported by the rails underneath. These rails end at

OUTLET End of Drawing Furnace. The 23-ft. dog-chain cooling conveyor in foreground suffices for air cooling. Parts drop from it into tote boxes and are then passed through the cleaning room

the quench chute and the trunnions ride on to another set of rails on the sides of the furnace. As the tray leaves the supporting rails it upsets, swinging by the trunnions from the side rails, and the work drops off into the quench.

At this point the puller reaches in, engages the trunnions, and pulls the tray out on to the rails of the pass-over conveyor, over the quench tank and to the loading table of the drawing furnace and places it in position to receive the work again. The parts are brought up to this point out of the quench by a slat-type continuous conveyor and an operator reloads them into the trays.

The drawing furnace is similar to the others except that it is heated by only two burners. After the work has passed through the proper heat gradient, it is pulled out on to a dog-chain cooling conveyor, 23 ft. long. When finally the tray of cooled pieces is dumped, the work drops into tote boxes for removal to the cleaning room.

DISCHARGE from End of Normalizing Furnace Appears at Extreme Left with Chute (A) to Normalizing Cooling Conveyor. At right this conveyor rises from the receiving position and runs alongside the furnaces

This conveyor then makes a turn with the tray and upsets it on to a single-strand chain conveyor, where it rides on edge and between two guide rails. This conveyor runs the length of the three furnaces and delivers the tray on to a "turn around" conveyor in front of the charging end of the normalizing furnace.

As the tray is tipped over on to this "turn around" conveyor, it lies flat but with the trunnions pointing to the rear. To correct its position the conveyor, which consists of two parallel traveling chains with slats between, makes a complete turn with it and drops it down on to a short gravity conveyor which feeds it to the loading platform of the normalizing furnace.

Production has been greatly in excess of that from the furnaces formerly used. The output of this installation is equal to that of 24 box furnaces, and two men only are required, as contrasted with 12 men on the box furnaces. Due to atmospheric control, scaling and pitting has been almost entirely eliminated, and spoilage has been reduced considerably over the entire range.

Handling Steel Tubes into Storage with One Operator

USING a combination of an overhead carrying device and a permanent stacking rack, steel tubes in loads up to 2 tons are handled from unloading platform to storage and from storage to point of use in the plant of the Spicer Mfg. Co., Toledo, Ohio. The system was put in by Cleveland Electric Tramrail, Wickliffe, Ohio.

The permanent stacking rack consists, as one photograph shows, of two U-shaped steel bars for each load handled. The illustrations show 38 tubes in such a rack being taken from the platform alongside railroad car and dropped in position in the storage pile. This method of handling permits intensive use of the storage space, as aisles between loads are not necessary. Tubes of the same size and specification are piled in successive loads, one above the other, and may be removed as needed with the minimum of handling.

Two men in the railroad car unload the tubing by hand directly into the rack. One operator does all the transporting from that point into storage and again out of storage and into use. He needs no assistance beyond the floor-operated tramrail carrier running over the standard overhead rail system. He can pick up and store a carload of tubing in one-half day, and, depending somewhat upon the distance he has to move the loads, can keep two men in the car busy unloading and stacking on the platform.

One photograph shows the transfer between the low-level rail used on the platform, which passes through the door, and the high-level rail within the storage and manufacturing building. The section which is raised is operated by push-button control. Safety devices installed on this equipment prevent the load from running off the section being raised and also prevent the load from running over the end of either rail when the connecting system is not in position to receive it. A pin and socket device is used to produce proper alinement between the elevating section and the upper and lower rails with which it functions.

As the doorway through which the load passes from the platform has an automatic fire-door to conform with Underwriters' regulations, the section of track passing through the doorway is fitted with a swinging link which operates automatically as the moving fire-door comes in contact with the throw-out mechanism. This permits the door to be closed—either automatically, in case of fire, or manually, at the end of the day.

Depositing a Lift of Tubing on the Pile

Material Handling Applied to Nitrate

Chilean Industry Revolutionized by Labor-Saving Equipment —Twice as Much Nitrate Recovered from Ore with Sharp Cut in Cost

BY STERLING H. BUNNELL

AMERICAN material-handling machinery is successfully replacing labor, even where it is cheap. In the Chilean nitrate industry, Guggenheim Brothers have introducd a completely mechanized and highly efficient system of handling nitrate ore and extracting the nitrate or saliter. The new system is operated by a Diesel-engine plant aggregating 22,000 hp., and all heat in the engine exhaust gases and the jacket water is utilized in warming solutions used in the plant operation. The result, as compared with the Shanks system, which has been in general use without any essential improvement since its original invention long ago, is the recovery of about twice as much of the nitrate contents of the caliche in the ground, with only 30 per cent of the labor, and about 18 per cent of the fuel per ton of nitrate, and a reduction in cost amounting to over $10 a ton.

The story of the great Chuquicamata copper deposit, containing 1½ per cent copper and considered utterly without value some 20 years ago, is generally known. The development by E. A. Cappelen Smith of the Guggenheim interests of mechanical means for crushing and leaching the low-grade rock in enormous quantities made Chuquicamata the enormously valuable mine of the Chile Exploration Co.

Old Practice Wasteful

The nitrate grounds, where more than 100 nitrate plants were operating, many of them at a loss and none with more than a bare profit, invited a similar development. The practice was to break up the caliche rock by hand, haul it to the extraction plant in small railroad cars or mule carts, crush it to 3-in. lumps and load it by hand into shallow iron tanks, where it was flooded with liquor from the previous operation. The broken rock and liquor were then heated by steam at about 40 lb. pressure and the liquor was actively boiled for several hours, until the greater part of the sodium nitrate contained in the caliche was dissolved. The saturated hot liquor was then drawn off into shallow open tanks and allowed to cool for six days, by which time a considerable quantity of the nitrate was crystallized out. The cooled mother liquor was then pumped back to tanks full of fresh caliche, while the wet crystals were shoveled out of the crystallizing tanks, carried to a drying floor, and left several weeks to drain off the excess water.

Waste was evident all along the line; the steam heated tanks were not jacketed, the crystallizing tanks were exposed to the hot sun by day, and the spent caliches or "ripio" still contained about one-third of the original nitrate contents, so that only about 60 per cent of the nitrate contents of the caliche was recovered. Further, only about 75 per cent of the caliche excavated ever reached the plant, the rest being broken fine or otherwise left on the ground. Very slight use was ever made of mechanical methods for handling the crushed rock; and, in contrast with American practice, there seems never to have been a consulting engineer or constructing firm specializing in the improvement of Shanks-system nitrate plants.

Cappelen Smith conceived the idea of constructing a huge nitrate plant, using the identical system that had proved successful in handling and leaching copper ore. On a tract of caliche land containing about 3 square miles, located about 60 miles from the port of Tocopilla in Chile, the Maria Elena nitrate plant was built. The caliche rock is brought to the crusher house in 30-ton railroad cars, and dumped in a revolving car dumper. The rock is crushed successively in jaw, gyratory and Symonds crushers to a size about ½-in., and at the rate of about 16,000 tons a day.

From the crusher house, the material is transported by a long conveyor belt, which discharges by a tripper into a movable vat-filling and spreading mechanism, carried on a cantilever bridge supported on a gantry on railroad tracks, as shown in one of the accompanying illustrations. The loader bridge can thus fill in uniform layers any one of a series of 10 concrete tanks about 100 ft. square by 20 ft. deep.

After filling with rock, the tank is flooded with mother liquor, which is warmed by waste heat from the Diesel engines and circulates through three tanks in succession, until its nitrate content is built up to near saturation. The strong liquor is then circulated through a series of countercurrent coolers, the last of which are refrigerated, so that the nitrate is caused to crystallize out. The cooled liquor returns through the countercurrent coolers, taking on heat from the hot liquor coming from the leaching vats and thus conserving all possible heat energy. The condensers of the refrigerating machines are cooled by liquor requiring to be heated.

New Equipment and Methods Yield Savings

When the oldest of the three tanks in the series gives up the last of its nitrate, it is cut out and a tank of fresh rock is cut in. After draining the tank of mother liquor, the spent caliche is unloaded by grab buckets from two cantilever bridges working together in the same tank. The wet ripio, which contains only 2 to 3 per cent nitrate, is delivered by hoppers in the gantries supporting the unloading bridges to railroad cars and hauled away to a dump. The gantries and tracks supporting the unloading bridges are located on the opposite side of the leaching tanks from the loading bridge and constructed high enough to pass over the latter, so that the operation can proceed in regular order from one end of the row of tanks to the other, returning from tank No. 10 to tank No. 1 at the beginning of the line.

Besides the large rock-crushing plant, leaching tanks and material-handling machinery, the equipment comprises an elaborate system of pipes or valves by which any of the tanks can be connected into the system as required, a pump house with 26 motor-driven centrifugal pumps, the countercurrent coolers, crystallizing tanks, handling

DRAG Scrapers (A) Remove the Overburden of Earth from the Caliche. Mining is by power shovels. The shovels load the caliche into steel cars (D) on the track alongside. Trains are moved by electric locomotive (C) operating by trolley on main lines and by storage battery on loading tracks. Power for the shovels is supplied from portable transmission towers. Jackhammer drilling (B) prepares the caliche for blasting

mechanism, centrifugals and conveyor belts for drying the nitrate and delivering it to the loading platform, ammonia refrigerating machinery, air compressors and a very complete machine shop with iron and steel foundry. The plant proper is more than a mile in length.

Power Scrapers and Shovels Employed for Mining

The development by Col. Robert Marsh, Jr., of a successful system of using large drag scrapers and power shovels for mining caliche is an equally important innovation at the Maria Elena plant. The practice of the Shanks plants has been to mine entirely by hand, with some blasting by black powder in hand-drilled holes. The miner piles his lumps of caliche for inspection by an overseer, who makes a crude test of a few pieces by touching them with a smoldering wick called a "mecha," and judging the percentage of saliter by the emission of sparks. Hand mining is an expensive and slow operation, requiring a large number of men, all of whom must be provided with housing at the cost of the plant, as the nitrate region is a desert incapable of supporting life except in such organized industrial communities.

But the application of shovels to caliche mining was not easy. The caliche lies in irregularly distributed layers from one to several feet thick, generally overlain by a stratum of "costra," which is a low grade nitrate-bearing rock, and above that by a layer of "chuca," or fine earth. Below the caliche is found "coba," rock containing no nitrate, and below this is the hard packed earth known as "banco." There may be a thin salt layer above the caliche, and all these layers vary greatly in thickness and distribution.

The only way to ascertain the amount and quality of the caliche is by digging holes through the various layers, and sampling from the sides of the holes; and the methods in use are so uncertain that it is customary to apply arbitrary discounts, or "castigos," to the official test reports, cutting off two or three points from the nominal 20 per cent which is near the minimum for profitable operation by the Shanks system.

Economy in Payroll Pays for Mining Equipment

The mechanical mining operation thus requires the stripping of an irregular overburden of part loose earth, part rock, from an irregular layer of nitrate-bearing rock, generally less than 3 ft. thick, and varying in nitrate content from perhaps 20 per cent at one point to zero in a

test hole 20 to 30 ft. distant, perhaps again showing 20 per cent in a hole farther on. As the power shovel cannot pick and choose its material, but must take it as it comes, it was evident that the grade of caliche recovered by mechanical methods would average much less than the 15 to 20 per cent that would be obtained by individually hand-picking each lump. The shovel, however, would get all the caliche, the good with the poor, while the hand operation left at least 25 per cent in the discard.

The economy of the mechanical mining operation would be enormous, as over 20 tons would be handled per man, against only 2 or 3 tons by hand. Computation showed that in an operation of the magnitude planned the saving in housing and welfare work by reason of the reduction in labor force would amount to nearly $4,000,000, enough to pay for the complete mechanical mining equipment.

The system worked out by Colonel Marsh comprises a rectangular loop of railroad track, crossed by loading tracks which are easily movable. By sampling by test holes with much more care than was ever the practice with hand mining, the depth of the overburden and the caliche are ascertained, and any patches of worthless material approximately located, so that the mining operation can skip them. The overburden, after being loosened by blasting with black powder, using compressed air drills and electric shot-firing, is removed by drag-line scrapers and deposited on the previously worked ground. Following the drag-line scraper, an electric shovel loads the caliche, also loosened by blasting, into steel cars on the loading track alongside.

The cars are moved in trains of six by electric locomotives, operating by trolley on the loop track of the yard tracks, and by storage battery when on the loading tracks. Power for the shovels is carried by overhead electric conductors supported on steel transmission towers on skids. When the caliche has been exhausted from a strip of ground alongside the loading track, the transmission towers are simply dragged, by hitching on a mule, to a new position, and the track is picked up, steel ties and all, in 66-ft. lengths by a suspension frame attached to a drag line hook. Thus in a short time the whole of a loading track may be shifted to a new position, and regular working can proceed over the entire area.

The Maria Elena plant, when put into operation, had

CALICHE Rock Is Brought in 30-Ton Cars to the Crusher House (F). Dumped into a revolving car dumper, the rock is crushed successively in jaw, gyratory and Symonds crushers. It is then transported by a long conveyor belt (G) and picked up by a loading bridge (H), which distributes it in a series of ten concrete tanks (J). Here the rock is treated with hot mother liquor, which, after becoming saturated, is passed through coolers to crystallizing vats. Nitrate stock piles above these vats are shown in upper left. In the middle foreground is a concrete tank partly emptied of spent caliche. In the distance (E) may be seen the workingmen's town

considerable surplus capacity; but the grade of the caliche proved to run lower than expected. The efficiency of the extraction was, however, so good that nearly 90 per cent of the saliter in the caliche was recovered, in spite of the fact that the caliche occasionally ran as low as 8½ per cent in saliter content. It should be noted that the Shanks-system plants become very inefficient with caliche of even 15 per cent content, so that all rock running below 15 per cent is discarded and left in the waste pile.

As the inevitable operating difficulties of a new plant were smoothed out, the output of the Maria Elena plant increased, until it became evident that it would have a capacity of 500,000 tons of saliter per year, and would recover about twice as much saliter from a given area of caliche ground as would be possible with the Shanks system, besides working profitably on material too poor for any Shanks plant.

About 9000 persons form the community at Maria Elena; and this is about one-third the number that would be required to produce the same amount of saliter by Shanks plants, of which it would take four or five of the largest size to equal the output of Maria Elena.

Change of Great Importance to Chile

The completion of the plant, with the successful solution of all difficulties and the expansion of production to double the original schedule, settled all doubts as to the economies effected by the Guggenheim system. The operating managers of Lautaro Nitrate Co. made many visits to the Maria Elena plant and inspected its operations thoroughly. They studied the operating costs and production figures, and became convinced that the Guggenheim system outclassed the best possible Shanks plants. Negotiations were accordingly begun that resulted in the control of the Lautaro Nitrate Co. passing to the Guggenheim interests, and in new financing for immediate construction of a 500,000-ton plant on caliche lands recently purchased by the Lautaro company and not yet developed with a production system.

The wasteful practices in the production of Chilean nitrate hitherto, by which the best spots were mined first and the poor material left untouched, have resulted in the loss of a large proportion of the nitrate in lands already worked, and a corresponding loss to the Chilean Government in revenue that would have been obtained from the saliter. The development of the unworked territory and large plants capable of producing saliter at low cost will be of great advantage to Chile, strengthening an industry that has been operating under great difficulties, and maintaining the revenue of the Chilean Government from the nitrate deposits, which are the principal source of Chile's national wealth.

Importance of Good Steel-Plant Lighting Systems

UNDER the conditions which now obtain in steel plants, according to M. H. Morgan, Jr.:*

1. Good light is cheap—because of great advances in the art of making electric lamps and shades and because of the low cost of electric power to steel plants.

2. Good light is of the essence of safety—because we must be able to see well to be safe.

3. Good light is a powerful aid to production—because men can and will do more and better work when they can see well.

Good light is cheaper in most cases than the very floor it illuminates; it is about the same in both first cost and operation as toilet and janitor facilities. A good interior lighting system may be installed in steel works buildings for from 5c. to 10c. a sq. ft., depending upon the class of work done and the amount of light which that work requires. This system may be maintained and operated for 2c. to 4c. a sq. ft. a year, assuming that it is used 12 out of the 24 hr., which is an average figure.

Exterior lighting is harder to estimate. If existing buildings and poles may be used to support fixtures and wiring, the cost of installation is about half that already given. The intensity used is much less and the operating cost somewhat less than half, because it is practically never necessary to use outdoor lights during daylight, whereas a dark, cloudy day frequently requires artificial lighting of interiors.

Safety Conserved by Good Lighting

Good light is of the essence of safety. Sight is by far the most useful, the keenest and the most important of the senses which inform us of obstacles, moving objects or other impending dangers; and safety most often depends upon quickness of perception of impending danger.

A report of accident causes concerned with lighting is made every few years to the Illuminating Engineering Society by the Travelers' Insurance Co. In 1910 the report showed that 23 per cent of industrial accidents were due to inadequate or improper lighting; in 1918 the figure was 10 per cent; in 1928 it was still 15 per cent, in spite of the vast improvement effected in lighting systems.

Better Output Where Lighting Is Good

A distinct gain in production is the usual result of increasing the illumination, in plants of almost every kind, from "fair" to that of the present standards. A reduction in the amount of "seconds" produced, and less spoiled material due to the workman's greater sureness of eye and lessened tendency to make mistakes, is also a usual secondary result. This conclusion is the result of tests made during the past five years upon shops and even entire plants before, and again after, bringing the lighting up to present standards.

These tests were conducted in some cases by the management of the plant; in others by the National Electric Light Association or the lamp manufacturers. The number and variety of tests, the fact that they come from so many different sources, and their substantial agreement show that the tendency toward increased production and increased accuracy of work with bettered lighting is a real and a forceful one. I quote below from several such reports:

Character of Work	Light Intensity		Increase in Production
	Old	New	
Making babbitted bearings	4.6	12.7	15 per cent
Heavy machine work	3	11.7	10 per cent
Manufacturing piston rings	1.2	18	25 per cent
Inspecting roller bearings	5	20	12.5 per cent

A good steel mill lighting system will have certain recognizable qualities, chief among which are:

1. Adequate intensity of light.
2. Freedom from glare——uniformity.
3. Provision for cleaning.
4. Provision for turning lamps off or on singly or in small groups.

Classes for Open-Hearth Furnacemen

Instruction on Important Phases of Steel Making Given at Six Months Intervals Pays Big Dividends in Improved Furnace Efficiency

BY MARTIN J. CONWAY*

MARTIN J. CONWAY

ABOUT 18 months ago some careful computations were made to contrast the estimated cost of various kinds of fuel in the open-hearth department of the Lukens Steel Co. We have 18 basic furnaces with total rated capacity of 1350 tons, and six smaller acid-lined furnaces (total rated capacity 240 tons). Up to the time of the investigation these had been fired with gas made in a battery of 52 stationary producers, using western Pennsylvania bituminous coal.

It appeared that large annual savings, running into six figures, could be made by the use of the heavy oil available at refineries at Marcus Hook, Del., the residue after distilling gasoline and lubricating oils from crude petroleum. This was to be delivered by motor truck and trailer via 35 miles of improved highway. (It may be remarked in passing that this method of transport has proved entirely satisfactory; several trucks, each with trailer carrying 120 bbl. per load, are in service. Costs are materially lower than the railroad freights—whether the latter are much too high is another question.)

Classes Instituted to Facilitate Change to Fuel Oil

From an engineering standpoint the change from gas to oil was not without difficulty. From an operating standpoint there were many chances for trouble, for none of the first helpers or melter foremen had ever run furnaces with oil fuel. It would be easy for a workman to melt down the furnace ports with the short, sharp flame, thus causing greater expense in refractories than the anticipated savings in fuel.

To avoid such untoward developments, the management approved our proposal to institute a training course for open-hearth operators. We were to meet on a certain afternoon each week, immediately after change in shifts. Melter foremen and first and second helpers for the entire plant came, on their own time, to a convenient and quiet corner of the storeroom, where benches, blackboard and other equipment were provided. Owing to rotation of shifts the instructors, who included the open-hearth superintendent and the fuel engineer, went over the same ground three times in succession, and devoted one hour each week to the actual work of instruction (although many hours were necessary for preparation). Each man came once every three weeks until four lessons were given. In all 12 weeks were required.

Model of Furnace Used to Advantage

Aside from a careful consideration of the topics to be discussed and the method of conveying somewhat technical information in terms the workmen could understand, the principal work of preparation consisted of building a scale model of the furnace, blocks, chambers, flues and valves. This was done by the pattern-making apprentice, and the views show it to be a creditable job. The roofs of furnace and chambers can be removed, so the interior shape and construction of the hearth and checkers can be observed. The blocks are also sectionalized so that the relationship of ports, downtakes and slag pockets can be studied. One end of the furnace was built to illustrate the prevailing conditions with gas firing; the other end represented the way the new oil fuel would be used.

This model proved to be invaluable. Most furnace men think that all there is to their furnace is above the charging floor—what they see in their daily work. Many of them, if they think of the checker work at all, think vaguely that it is part of the foundation, just under the hearth. Few indeed would be able to visualize the various flue connections, and be able to tell *why* certain changes should be made in the valves, flues and checkers to correct a definite condition in the hearth.

After the "training course" had been organized and properly advertised all the men fell into the spirit of it promptly. Absences were rare. Close attention and active discussion was the rule.

Ordinarily I would talk extemporaneously for about 20 min., covering all the points in an outline before me. Then the open-hearth superintendent would take about an equal length of time, developing certain phases of the subject in shop language, and illustrating his points with incidents which occurred recently in the department. Finally the meeting was open for questions, either from the floor or from the plant question box.

At the end of the fourth lesson, each man was given a copy of the lecturers' notes, neatly bound in a folder, and a group of photographs of the model.

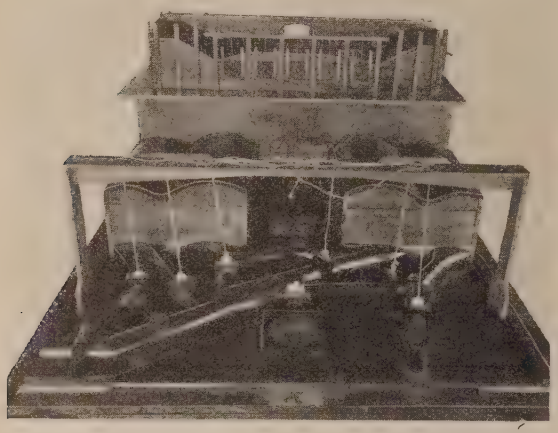
Improves Efficiency of Entire Plant

Results have been gratifying, even if hard to measure in dollars. The principal object was achieved, in that the change from gas fuel at 2-in. pressure to oil at 100-lb. was made without difficulty of any sort. Of course the oil was put on one furnace at a time, after the superintendent could be sure that the melters were handling the situation properly. But the whole operation of the department took on a different tone. Minor troubles were less frequent, the average time per heat was materially less, the consumption of ore and pig iron at the finish was cut down, and the maintenance charges lowered.

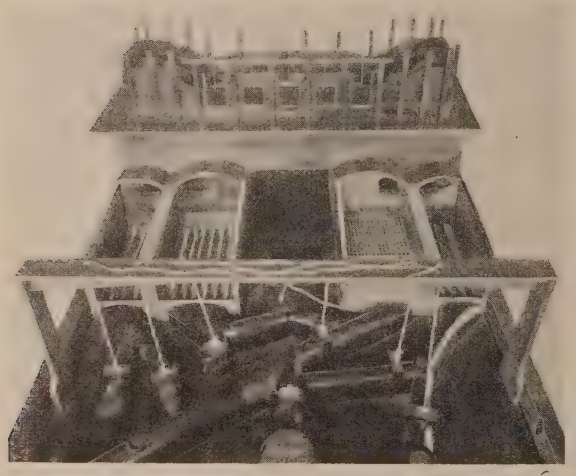
Summing up, the expected economies of oil-firing were realized, even exceeded. As a result it was decided to continue the course of instruction, and this has been done

*Fuel engineer, Lukens Steel Co., Coatesville, Pa.

at intervals of six months. The broad outline of the course remains unchanged, in order to care for new employees, but emphasis is placed on phases which the plant records show need attention. For instance, in the last course, particular attention was given to bad bottoms, to



WOODEN Model of Open-Hearth Furnace Is Sectionalized so Interior Form and Construction Can Be Studied



accidental alloy in skelp steel, to proper manipulation of ingot iron heats, and to the economies of melting to the correct carbon, neither high nor low.

Outline of Original Course

Lesson I—Furnace Construction:
1. Furnace buckstays and bindings
2. Construction of hearth; importance of tap hole
3. Walls and doors
4. Roof
5. Blocks; bulkheads, ports (gas vs. oil), slag pockets
6. Rearrangement of downtakes for oil firing
7. Regenerators; function, size, construction
8. Flues and valves

Lesson II—Furnace Operation:
1. Starting a cold furnace
2. Making bottom
3. Duties of first and second helpers
4. Qualifications of first class melter foreman, first helper, second helper
5. Repair of furnace between heats
6. Order of charging
7. Working period
8. Judgment of temperature
9. Tapping the heat

Lesson III—Making the Most Steel with the Least Fuel:
1. Low fuel efficiency of the open-hearth process
2. Improving efficiency by
   a. Improving quality of fuel
   b. Increasing furnace output
   c. Burning fuel completely and cutting down stack temperature
3. Discussion of principles of combustion
4. Nature of producer gas and fuel oil
5. Atomizing fuel oil
6. Factors for success in use of fuel oil
7. Influence of checkers:
   a. Cleanliness
   b. Period of reversal

Lesson IV—Reactions and Temperature:
1. Oxidation during melting stage
2. Slag formation with lime, magnesia and silica
3. Manganese and sulphur
4. Fixing phosphorus in the slag
5. Ore and lime boil
6. Carbon elimination and its effect on slag
7. Function of addition; efficiency or recovery.

Slight Adjustment to Coupling Causes Failure in Crankshaft

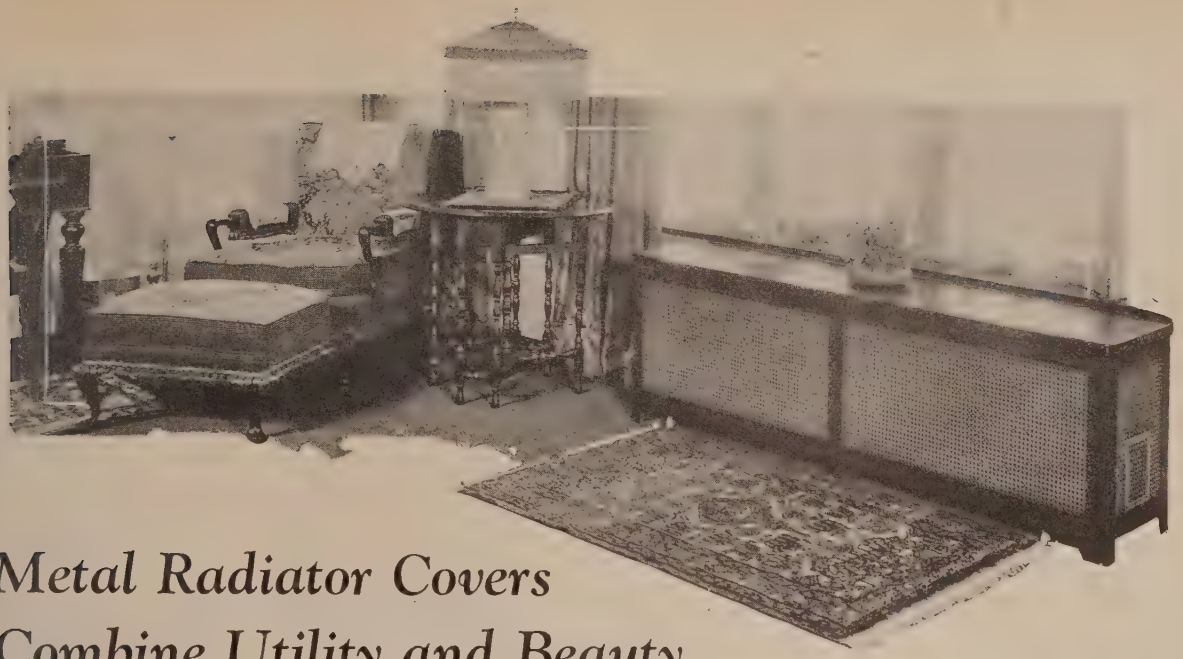
It will be recalled that the second flight of Graf Zeppelin toward America nearly resulted in disaster through crankshaft failures in two of the engines. At the time the trouble was attributed to the fact that superchargers were installed after the first successful transatlantic flight. Tests have been made on these engines at the German Testing Institute for Aircraft at Berlin and, with the assistance of a Geiger torsiograph, it was discovered that, when the rigidity of the crankshaft coupling was adjusted to a certain value, torsional oscillation of the crankshaft occurred at the regular working speed of the engine. It was demonstrated that a relatively small alteration in the rigidity of the coupling made previous to the second flight had been sufficient to bring the critical speed within the range of the working speed.

Bending Tests on Concrete Reinforcing Bars

A bend test machine has been developed at the Bureau of Standards, in which bars of various sizes and shapes appear to undergo approximately the same strain when bent through the same angle. With it tests were made on concrete reinforcing bars.

Unusual tests for this class of material consist in bending the bars, without heating, through 90 to 180 deg. with a radius of bend equal to 1, 2 or 3 diameters of the bar. The angle and radius of the bend depend generally upon the size and hardness of the bar. It seems that the tendency is to suit the specification to what the bars of different grade will meet successfully rather than to the service demanded of the bars in bending for use as reinforcement.

In the tests made on bars purchased in the open market at the bureau, those which did not break in the cold-bend test were not seriously affected as to strength by the bending. The apparent yield point in the bending test was much higher than the yield point determined in direct tension test. The impact test used gave an approximate measure of the yield point of the bar, but none of the bars broke in the impact test except a few which had been quenched in water from a high temperature.



Metal Radiator Covers Combine Utility and Beauty

BY J. B. NEALEY

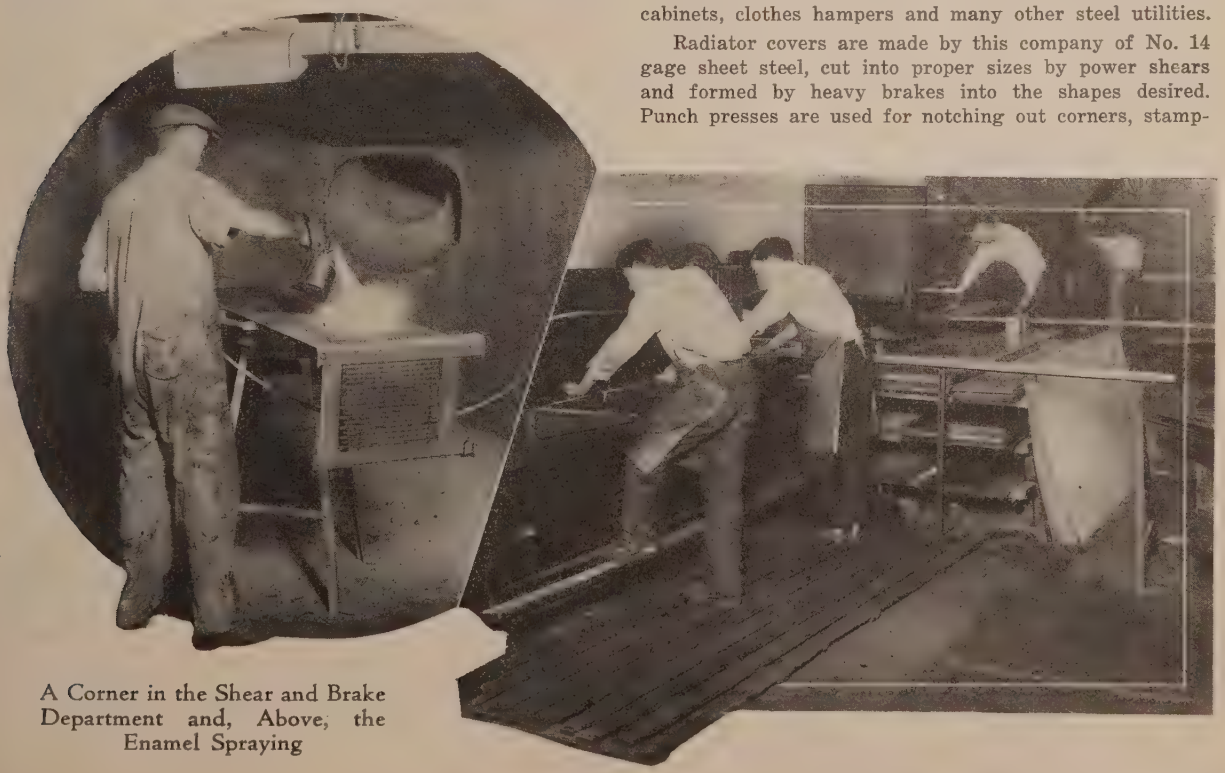
WHILE steel is essentially utilitarian, many markets have been won and there are others that could be won by combining the utilitarian with the beautiful.

The manufacture of metal radiator covers is an example of a large market that has been created by combining the practical with the merchandising factor of attractiveness.

At the outset, as well as now, these covers were designed to conceal the obtruding radiator, and sometimes to include a humidifier for the air and to eliminate wall smudge, but it was necessary to beautify them in order to sell them. So far has this idea been carried out that the schemes of interior decoration, woodwork finish and wall color treatments of individual homes and buildings comprehend harmonious designs and colors in the radiator covers.

While today there are many manufacturers of metal radiator covers, the industry is only 10 years old. One of the pioneers is the Art Metal Radiator Cover Co., Chicago, which, in addition to holding a major place in this field, is prominent in the manufacture of bathroom cabinets, clothes hampers and many other steel utilities.

Radiator covers are made by this company of No. 14 gage sheet steel, cut into proper sizes by power shears and formed by heavy brakes into the shapes desired. Punch presses are used for notching out corners, stamp-



A Corner in the Shear and Brake Department and, Above, the Enamel Spraying

ing out small sections, flanging, etc. Parts are welded by spot and oxy-acetylene processes.

All orders are grouped into schedules according to finish, wood grain, marble, plain color, inlays, etc., and any one of these schedules may carry from 50 to 250 different kinds of finishes. Any one unit may have as many as 12 coats of enamel.

As rust is detrimental to finishes, all steel is covered with oil, which must be completely removed before the finish is applied. Washing in naphtha removes most of the oil, the remainder being taken off by mechanical sanders. The prime coat must be elastic enough to absorb any oil that may be left. The cost of cleaning some of the grilled panels, it is stated, ofttimes amounts to 10 per cent of the total cost.

The prime coat and succeeding coats and enamel are sprayed on, a long line of booths being provided for this purpose. Each coat is then baked in specially constructed gas ovens, after which the coat is hand rubbed and smoothed. The baking process is one of the most intricate in the entire process as the colors will vary with heat and time. When the proper heat cycle is determined for the work in hand, it is carefully noted and faithfully followed for the rest of that order.

Seven gas-fired ovens are employed, each 15 ft. long, 12 ft. wide and 8 ft. high. Swinging doors are provided in front, and the work is charged on racks mounted on trucks. Temperatures used vary from 250 to 800 deg. Fahr., and there is also a wide range of heating periods.

A machine shop is maintained for the making of all tools, dies, jigs, etc. In preparing for the manufacture of a recent model, it was necessary for the shop to make more than 50 dies, which is indicative of the important part such a shop plays in work of this kind.

Superheating Cast Irons Shows Varying Improvement

A SERIES of tests has recently been reported in which the physical properties of a number of cast irons were compared after each iron had been subjected to three different degrees of superheat. The original article was entitled "Die Überhitzung von Gusseisen," by Peter Bardenheuer and K. L. Zeyen, and was published in *Mitteilung Kaiser Wilhelm Institute für Eisenforschung*, No. 130, Düsseldorf, Germany.

Higher Carbon Irons Are Improved

In general it was found that, with normal silicon content, the higher carbon irons showed an improvement in properties as the superheat was raised from 1365 to 1480 deg. C. and finally to 1605 deg. C. Irons with less than 3 per cent carbon showed no improvement or a definite impairing of these values.

Low-carbon irons may, however, be made susceptible to superheating by using high-silicon contents, or by adding part of the silicon as powder in the ladle. Addition of alloying elements such as chromium also increases the tendency towards improvement on superheating.

High-Frequency Furnace Used

In making the tests, a high-frequency induction furnace was used to melt and superheat the metals. For each sample a period of 15 min. was allowed at the superheating temperature, after which it was poured into a ladle and cast at about 1350 deg. C. into rods for test bars. All the bars were cast in dry sand molds. A few of the many reported results are here reproduced.

Melts No. 1, 2, and 7 illustrate the difference between the high and low-carbon irons. No. 10 brings out the effects of adding half the total silicon in the ladle and No. 14 shows a melt of very high-silicon iron. Both improve on superheating. In melt No. 18, 0.39 per cent Cr. was added, replacing Mn. In spite of the low silicon, this iron is considerably bettered by the high temperature.

Results of Superheating Cast Iron

Promoting a Dendritic Structure Harmful

In explanation of the findings, the theory is advanced that anything which tends to promote a dendritic structure is harmful. Presumably, at the high temperature employed, all of the graphite will be dissolved. Consequently when the iron cools, there is more of a tendency for undercooling than would be the case were there a few graphite nuclei present in the liquid. Opportunity is thus given for the sudden formation of fairly large dendrites with an interstitial network of finely divided graphite and ferrite. The purpose of adding silicon or of raising the silicon content with low-carbon irons is to increase the tendency for the regular precipitation of graphite on solidification.

Great Britain Controls the Chromium Supply

The source of all commercial chromium is the mineral chromite. Commercial chromite, however, contains from 35 to 55 per cent Cr_2O_3, the lower grades being used for refractories and the higher grades for steel making and in the chemical industries.

In the early part of the nineteenth century Maryland was the world's most important source of chromium. From 1860 until 1903 Turkish ore dominated the world market. Turkey was supplanted by New Caledonia in the period from 1903 to 1913, and, since the war, Southern Rhodesia has been the principal producer. The rapid development of the deposits in the Transvaal in the past two years provoke some speculation as to whether or not the Union of South Africa will some day surpass Rhodesia. Irrespective of the relative positions occupied by Rhodesia and the Union of South Africa, the British Empire will control the world market for many years, says "Mineral Industry, 1928."

Roller Bearings Put Old Mill Motors

Use of Oxy-Acetylene Cutting and Arc Welding in Altering Motors for Standard Bearings

BY J. L. BROWN*

SOME more or less successful attempts have been made to put roller bearings in existing mill motors without conforming to the "300 series" adopted as standard by agreement between the Association of Iron and Steel Electrical Engineers and the roller bearing manufacturers. This standardization, intended to apply primarily to future motor designs, has the obvious advantages of interchangeability as between various makes of roller bearings, simplification of manufacture and reduction in the number of spare parts, but its greatest efficiency cannot be realized unless it can be made to apply to existing designs and bearing change-overs in existing motors. The following paragraphs with accompanying cuts show clearly and in detail how this may be accomplished with a minimum of effort by the use of oxy-acetylene cutting and arc-welding. Fig. 1 shows the end of one half of a mill motor frame of average size opened to display the interior form of the bearing housings. By comparing Fig. 2 with Fig. 1, it will be seen that the central support or web has been cut away. This web is used in the sleeve bearing design to support the inner end of the bearing. This cutting is done to each of the four half-housings by means of the oxy-acetylene flame. The total cutting time per frame to remove the webs and other irregular projections which might interfere with the roller bearing cartridge was 2.5 hr.

The necessary welding additions to the housings were made in 14 hr. The frame interior with welding additions in place is illustrated in Fig. 3. The comparatively thin inside web of the original housing has been built up to form a substantial support for the inner end of the roller bearing cartridge.

After the final machining, which required 3 hr., the interior of the frame appeared as in Fig. 4, permitting assembly of the roller bearing cartridges as they appear in the complete motor assembly, Fig. 5.

Only a few years ago the modifications described and illustrated here would have seemed very difficult, but with the rapid development that has taken place in recent years in steel fabrication by the electric arc and oxy-acetylene flame, the necessary modification becomes only an average job when adequate working drawings are available.

Lewis-Shepard Co. Acquires Plant in Indiana

The Lewis-Shepard Co. announces the purchase of a brick manufacturing building containing approximately 60,000 sq. ft. of floor space at Crawfordsville, Ind. Instead of putting up additional buildings at Watertown, Mass., the company has decided to operate the branch factory at Crawfordsville, to serve customers west of Cleveland. It is expected that production will be well organized at Crawfordsville by Oct. 1.

The Lewis-Shepard Co. was incorporated in 1915, and since that time has expanded its manufacturing area six different times. At the outset the Crawfordsville plant will manufacture chiefly skid platforms for lift trucks and storage racks for use with portable elevators. The production of lift trucks and stackers will probably be added to the Crawfordsville production schedule as soon as possible.

Blaw-Knox Co. Announces Personnel Changes

Following the acquisition by the Blaw-Knox Co., Blawnox, Pa., of the Lewis Foundry & Machine Co., Groveton, Pa.; the Union Steel Casting Co., Pittsburgh; the National Alloy Steel Co., Blawnox, and the Pittsburgh Rolls Corporation, Pittsburgh, a number of changes in the executive personnels and boards of directors of all the companies have been announced.

The membership of the board of directors of the Blaw-Knox Co. has been increased from 16 to 22 and the following members added: J. P. Allen, president, Union Steel Casting Co.; Frank Cordes, president, Lewis Foundry & Machine Co.; J. R. Dunsford, vice-president of the Lewis company; D. L. Eynon, president, Pittsburgh Rolls Corporation; Samuel Harden Church, director in the Union company, and C. M. Thorp, Pittsburgh attorney.

Mr. Cordes has also been made a vice-president of the parent company. He continues as president of the Lewis company and also becomes vice-chairman of the board and a director of the Union company and the Rolls corporation as well as vice-president and a director of the National Alloy Steel Co.

Albert C. Lehman, president, Blaw-Knox Co., becomes chairman of the board of each subsidiary company. In addition to those mentioned above, the subsidiaries include A. W. French & Co., Chicago, manufacturers of road building machinery, acquired by Blaw-Knox early this year. Present officers of the parent company are A. C. Lehman, president; I. F. Lehman, F. M. Bowman, Frank Cordes and Wayne Rawley, vice-presidents; Benjamin L. Hirshfield, treasurer, and Chester H. Lehman, secretary.

Merger of British Steel Companies Imminent

A merger of leading steel producers of Great Britain involving between £20,000,000 and £30,000,000 ($97,000,000 and $145,500,000) is reported imminent. Outstanding in the new corporation would be the combination of Dorman, Long & Co., Ltd., with £12,000,000 ($58,200,000) capital stock, and Bolckow, Vaughan & Co., with £8,000,000 ($38,800,000) capital stock. Negotiations between these leading companies in the iron and steel industry have continued for some months and agreement in principle was reached some time ago.

Dorman, Long & Co. in 1923 acquired control of the plant and properties of Bell Brothers, Ltd., North Eastern Steel Co., Ltd., Sir E. Samuelson & Co., Ltd., and the Carlton Iron Co., Ltd. In addition to its own bridge and construction plants, mines and collieries and by-product coke operations, the company controls the Redcar Iron & Steel Works, Clarence Iron & Steel Works, Acklam Iron & Steel Works, Newport Iron Works, Carlton Iron Works, Ayrton Sheet Mills and Cleveland Wire Mills, all in the Middlesborough district. It is a producer of pig iron, semi-finished steel, plates, shapes, bars, sheets, rails and accessories.

Bolckow, Vaughan & Co., Ltd., also of Middlesborough, produces ferromanganese, spiegeleisen, pig iron, semi-finished steel, bars, shapes, plates and rails and accessories. The rated production capacity of the company is 15,000 tons of pig iron and 8000 tons of steel products a week.

Appointed Sales Agent for Rustless Iron

The Superior Steel Corporation, Pittsburgh, has been appointed sales agent for the Rustless Iron Corporation of America for hot and cold rolled rustless iron strip. Future sales for the Rustless Iron Corporation of America in the Detroit district will be handled through the Superior office at 10252 General Motors Building, Detroit, in charge of Earl Park. Mr. Park will have associated with him J. Abbott as metallurgical salesman.

The office of the Rustless Iron Corporation of America at 731 Fisher Building, Detroit, will be maintained by A. L. Grinnell, as development engineer, to continue effort in the development of new uses of rustless iron.

Armco Stack at Ashland Makes Record

A world's record for production by a blast furnace with a 13-ft. 9-in. hearth is being claimed for No. 1 furnace at the Sixth Street plant of the Ashland, Ky., division of the American Rolling Mill Co. This furnace has just completed seven years of continuous operation, which record, we are informed, has been equaled or surpassed by only one other furnace.

While it has been surpassed in endurance it has achieved a better production record than any other furnace with a 13-ft. 9-in. hearth. The old lining contained 224,000 9-in. brick. During the seven years of continuous operation with this lining there were 809,951 tons of pig iron produced, or an average of 3.6158 tons per 9-in. brick equivalent.

The No. 1 has made other creditable output records as follows: Day, 454.82 tons; week, 2844.82 tons; month, 12,083.52 tons; daily average, 393.10 tons; pounds of coke per ton of pig iron, March, 1926, 1538.

Reed-Prentice Expansion

The Reed - Prentice Corporation, Worcester, Mass., manufacturer of machine tools, has let contracts for an addition, 60 x 150 ft. in size, to take care of expansion in business and to secure additional space on the assembly floor.

The Young Radiator Co., manufacturer of radiators, cooling systems and heating units, Racine, Wis., has been operating in the last two months 12 hr. a day in most departments, and day and night in the tool shop.

An X-ray study of firebrick is reported in bulletin 193 of the Engineering Experiment Station, University of Illinois, Urbana. The pamphlet is of 13 pages and copies may be obtained from the experiment station for 15c.

Presents Argument for Steel Roofing

Building Code Committee Told That Flat Steel Roof Made of Ribbed Alloy Steel Sheets Is Economical and Will Serve Every Purpose

HERETOFORE in the preparation of building codes for congested cities, roofing consisting of steel sheets has not been given consideration except for shed buildings and temporary construction. This is due to the fact that the steel roofing available in the past was not of a quality or design that merited consideration in first class construction, other than for mill buildings.

During the past ten years, however, there have been improvements and new developments in steel roofs. Many are being produced today that have all the qualities required in the better types of buildings.

These improved "steeldeck" roofs differ from the old corrugated form of steel roofs in that they are not merely a flat sheet rolled in a wave formation. On the contrary, they consist of special alloy or otherwise specially prepared steel sheets formed so that when laid in place they present a smooth, flat outer surface stiffened by ribs formed into the sheets themselves or welded to them. On account of this flat rather than a corrugated surface steeldeck roofs are capable of being properly insulated and waterproofed to form a permanent, indestructible structure.

Definite Advantages of Steeldeck Roofs

Any new construction to deserve consideration, should have some definite quality that constitutes an improvement. These qualities of improved steeldeck roofing are a decrease in fire hazard, when compared with wood, economy when compared with other incombustible roof materials, and permanency when compared with steel roofing as used in the past.

It is not necessary to present argument that there should be a definite place in a building code for a construction which may be used at a cost little in excess of a two-inch plank roof and at the same time consists of incombustible material which prevents the spread of fire either from the inside or outside. Steeldeck roofing does exactly this. It is permanent, is designed to have strength equal to that required for any other material used for roof construction, and has insulating qualities equal to, or better than, other materials now used.

The modern tendency of building codes, of which the proposed building code prepared by the United States Department of Commerce is an outstanding example, is to specify two grades of fireproof construction: (a) fully fireproof and (b) fire protected construction. Fully fireproof construction applies to tall buildings and those in which the contents constitute a serious fire hazard. Fire protected construction is applied to buildings of lesser height and having contents that represent a less severe fire hazard. The latter includes hotels, hospitals, theaters, schools, and other buildings principally for human occupancy.

ROBERT D. SNODGRASS, Consulting Engineer for Truscon Steel Co., Youngstown, Ohio, Presented This Brief for Steel Roofing to a Special Committee Devising a New Building Code for New York. This revision of the code is sponsored by the Merchants' Association, and takes recognition of the fact that a building code written many years ago cannot adequately recognize new building methods or materials developed meanwhile, nor permit economies arising from a higher quality in steel or other constructional material

In these classes of building the floors and roofs represent two very different types of fire risks. A floor having combustible materials both above and below must have fire resisting qualities that will confine the hottest fire of which the contents are capable to the area in which the fire has started. The roof, on the other hand, must only prevent the spread of fire by being composed of materials that will not contribute to the fire, that will prevent the hazard of flying brands, and that will protect the building from fires on the outside.

If roofs are required to have the same fire resisting qualities as the floors, the owner is being required to go to an unnecessary expense. Therefore the use of steel roofing should be permitted on both fully fireproof and fire-protected buildings, provided the roof and supporting members be separated from the floors below by fireproof ceilings.

Requirements for Permanency

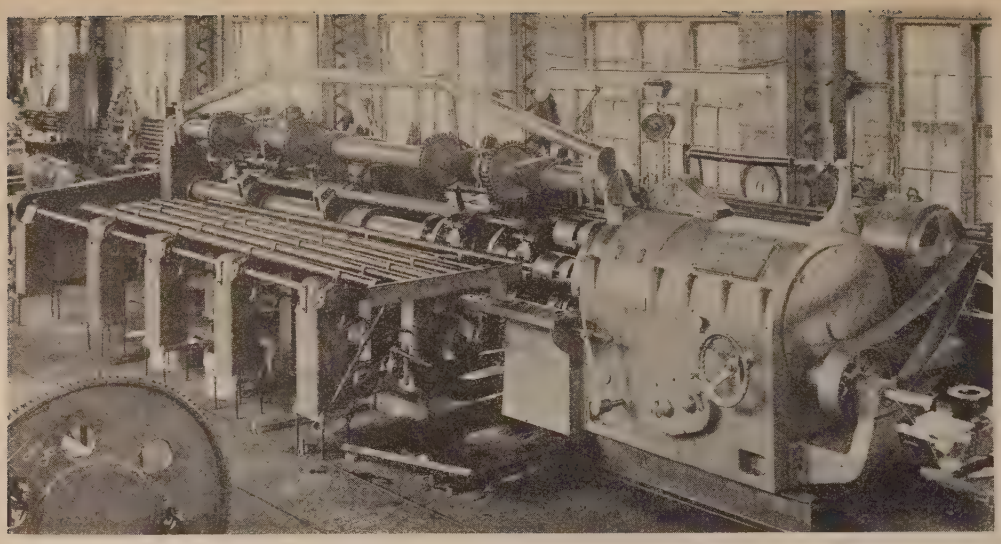
If they are to provide a permanent construction, steel roof sheets should be of not less than 20-gage steel rolled from a copper-steel alloy or other steel or iron sheets of equal corrosive resistance. Experiments conducted by the American Society for Testing Materials have demonstrated that steel containing 0.25 per cent copper or more is permanent when used as required in roof construction.

Steeldeck roofing of improved quality is now being manufactured by a number of well-known building material companies. All of them provide a deeply ribbed sheet designed in such a manner that the carrying capacity may be easily computed by ordinary methods. Depth of the sheets is variable to provide proper stiffness from the maximum to the minimum spans required in roof construction, and several gages are supplied to provide the required strength for supporting any desired live load.

To provide the needed thermal insulating qualities, the outside surface may be covered with any of the well known special insulating materials. As much or little insulation as required may be obtained by varying the thickness of this insulation. This insulation should be required only for fireproof building; in other types its use should be optional. Waterproofing should be used as required elsewhere.

Such a specification will provide a roof amply safe and fireproof for the fireproof classes of buildings and will result in a substantial saving in cost on all structures where steel roofing is used; and in other classifications this specification will tend to reduce the quantity of wood roofing used.

Scott-Weiss Steel Co., 110 South Dearborn Street, Chicago, has been appointed distributor for the products of the Una Welding & Bonding Co., Cleveland, and will sell its welding machinery to all industrial users except electric railroads.



A CRANE Places 5 to 7 Tons of Pipe on Skids Which Feed to the Conveyor That Is Part of the Pipe Threading Machine

Continuous Threading of Pipe

Machine Automatically Takes Pipe Lengths One After the Other and Discharges Them After Threading

CONTINUOUS threading machines for pipe up to 4 in. in diameter are now being manufactured by the Davis & Thompson Co., Fifty-seventh Avenue and Mitchell Street, Milwaukee.

Lengths of pipe are rolled down to a conveyor which is part of the machine. Stops are arranged so that the fingers which pick up the pipe will take only one pipe at a time, and rolls beside each conveyor chain press the pipe against a side channel-iron stop.

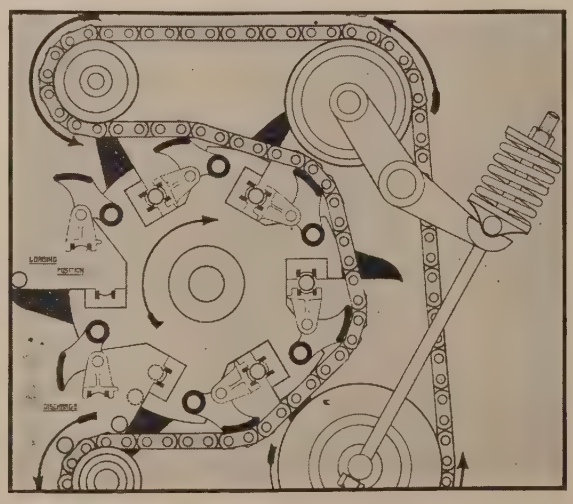
The rotating member of the machine is fitted with fingers which project out within reach of the conveyor and between the chains of this conveyor. These fingers pick up the pipe and as the machine rotates the pipe rolls on the fingers into jaws. Each jaw is equipped with a toggle and as the patented chain clamping arrangement wraps around the pipe carrier, pressure is brought on the toggle jaws, which clamp the pipe.

The dies then come forward. The dies are operated by cam and spring which force them on the pipe with proper tension. The pipe is threaded during rotation of the work carrier. When the pipe is threaded the proper length the die automatically opens and the spindle is withdrawn. As the toggle passes beyond the clamping action of the chain it automatically opens and releases the pipe which drops to a cast iron way.

There are six spindles in this threading machine and each spindle carries a die. Spindles are so arranged that they will thread the pipe concentric. Lubricant is forced through the fixture at a high velocity and the dies are constructed so that particles of grit, scale and dirt are washed out.

The machines are generally equipped with variable speed motors. Power is transmitted by a silent chain to the main drive shaft and from this shaft power is transmitted through silent chain to a friction disk clutch. The clutch is operated by a handle in front of the machine. This clutch controls the revolving pipe carrier and the travel of the spindles.

Sliding gears in the head provide speed changes beyond the variable speed motor range so that the machine can be used for threading pipe as small as 1 in. by the use of adaptors for small dies. Attached to and part of this machine is a gib crane which is used in removing die heads should one wish to do so without tying up the large traveling crane above the machine. The die heads weigh 400 lb. each. Chasers or segments can be changed readily without removing the die head from the machine. The machine is automatic in its action. Safety devices are provided to assure protection against breakage due to carelessness of operators in handling the machine.



PIPES Are Clamped in Jaws Which Are Closed by Toggles. The dies then come forward and the pipe is threaded during rotation of the work carrier

Machine Tool Subjects for Cleveland Meetings

The Machine Shop Practice Division of the American Society of Mechanical Engineers, in cooperation with the Machine Tool Congress, will hold two sessions in Cleveland during the Machine Tool Builders Exposition.

The first session will be on Monday evening, Sept. 30, with a discussion on "What information does the machine-tool buyer need when purchasing new equipment?" Another session will be on Tuesday evening, Oct. 1, the subject of which will be a discussion of "Present status of tungsten carbide as a cutting material."

A cargo of 16,158 tons of iron ore, said to have been the largest ever brought to South Chicago, Ill., was recently unloaded by the steamer Colonel James Pickands. Less than three weeks prior to the establishment of this record the steamer Samuel Mather broke the record of five years' standing when she brought in a load of 16,037 tons of ore.

New Multiple-Spindle Chucking Machine

Work Spindles Are Set Radially in Horizontal Turret, Presenting Work to Three Sets of Tools for Simultaneous Operation

A WORK - ROTATING multiple-spindle chucking machine that is a departure from usual designs has been brought out by the Goss & De Leeuw Machine Co., New Britain, Conn. In this machine the four work spindles are set radially, 90 deg. apart, in a horizontal turret and present the work to three sets of tools for simultaneous operation. The work is loaded and unloaded at the front position, the chuck being started and stopped by means of the lever just above it. This lever, which controls the driving gear in the work spindle, has three positions: a neutral position, which stops the spindle, an upper position, which engages a metal cone friction for picking up the load, and a lower position, which engages a dog clutch that furnishes a positive spindle drive.

Work spindles are driven by the main motor shown at the left in Fig. 1, and the mechanism is designed to transmit 25 hp. The power is transmitted through silent chain, back gears, quick-change gears and a pair of bevel gears to a vertical shaft in the center of the turret. From the vertical shaft the drive is through heavy spur bevel gears on the respective spindles. The four work-spindles revolve at the same speed. A two-to-one back gear furnishes a fast or slow speed for each combination of the quick-change gears, which are accessibly located (at the extreme right in Fig. 2). Spindle speeds ranging from 16 to 525 r.p.m. are obtainable.

A 5-hp. motor furnishes the drive for the turret indexing and all the feeds on the main tool-slides and the cross-slides. The third motor shown in Fig. 1, in the rear tool position, is part of the special revolving tool spindle attachment. This unit, which can be placed in any or all of the three main tool-slides, is noteworthy for its heavy spindle. It can be revolved at different speeds and, in conjunction with the revolving work spindle, a wide range of cutting speeds are obtainable, dependent upon the relative speeds of the two spindles. It is also said to furnish the ideal condition for drilling a true and straight hole, namely, revolving both the work and the tool. All three motors are connected to one control box and have conveniently located push-button control.

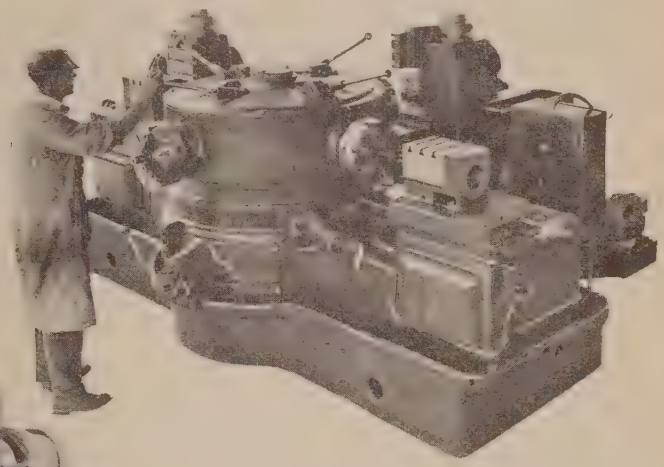
Threading, both internal and external, is accomplished by the lead screw method with a reversing electric motor, and can be done at any one of the three tool positions. Both inside and outside threads of different pitches can be cut simultaneously.

Placing the spindles radially provides room for any type of bearing. The machine illustrated has double-row ball bearings at the front and single floating ball bearings at the rear, both being of radial thrust type and pre-loaded to 4000 lb. With ball or roller bearings the forged alloy-steel hardened and ground spindles are made 4¾ in. in diameter; with plain bearings a 5¼-in. diameter spindle is used. The machine will swing chucks up to 20 in. in diameter.

The problem of indexing the heavy turret was solved by an unusual adaptation of the Geneva motion, double movement being used. Two rollers enter the Geneva slots one after the other, each moving the turret 45 deg. The turret is located in its indexed position by a heavy hardened and ground bolt that is tapered on one side, the bolt being operated by a compressed air cylinder with differential pistons that produces pressure of 2500 lb. The valve for these pistons is controlled by a cam on the outside edge of the Geneva wheel and therefore cannot get out of time. Operation of the bolt is without jar and is practically silent. After the locating bolt is in place the turret is locked in position by means of a large clamping ring bearing on two opposite 45-deg. sections.

Both the main tool and the cross slides are actuated by solid barrel track cams. These slides are of unusual weight and size and, by combining two motions, permit heavy taper turning and forming cuts to be taken. The standard plain slide carries a tool block having T-slots on its upper face. The block is also bored to take large boring bars or tool holders, while the side faces can be drilled and tapped for bolting special tool heads. The cross-slides also have T-slots.

Control is centralized. Coolant is



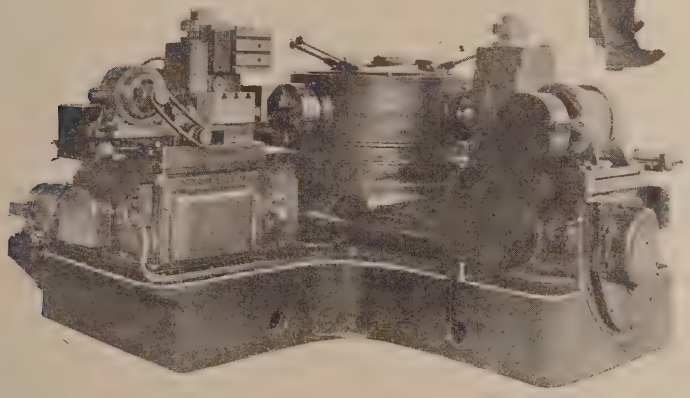


FIG. 1 (above)—Work Is Loaded and Unloaded at the Front Position, the Clutch Being Started and Stopped by the Lever Just Above It

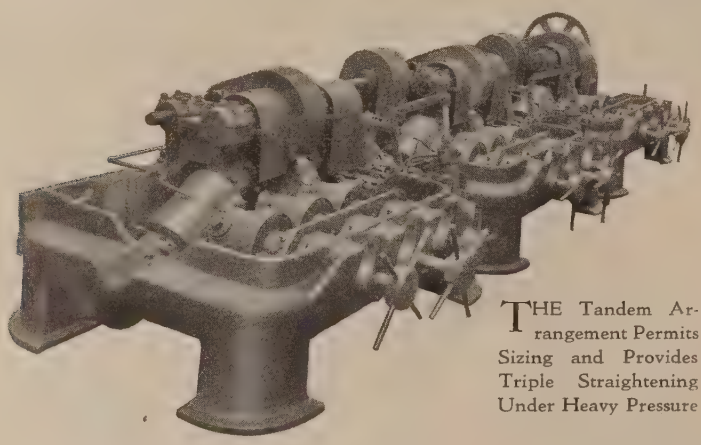
FIG. 2 (at left)—Work Spindles Are Driven by the Motor at the Right, Turret Indexing and Main Tool and Cross-Slide Feeds Being Actuated by the Motor at the Left. The third motor, in the rear tool position, is part of the special revolving tool spindle attachment

pumped from a 2-bbl. capacity reservoir located in the base. Thorough attention has been given to lubrication. All spindles and working parts within the turret are oiled by a separate wick-feed system that indexes with the turret. Lubrication of parts outside of the turret is by means of a mechanical oiler, oil being delivered to each bearing by a separate pipe.

This machine, designated as the No. 6, weighs 13 tons. It will be exhibited at the Machine Tool Show to be held in Cleveland Sept. 30-Oct. 4.

Machine Straightens, Sizes and Descales Steel Bars

A TANDEM arrangement to a straightening machine has just been brought out by the Sutton Engineering Co., Park Building, Pittsburgh, which, in addition to straightening, accomplishes the rounding up and sizing of hot rolled or cold drawn steel bars. The machine also eliminates the scale on bars in the operation.



THE Tandem Arrangement Permits Sizing and Provides Triple Straightening Under Heavy Pressure

The company's ordinary straightening machine as a unit consists of two drive rolls and three idler rolls, whereas this rounding-up machine consists of six drive rolls and nine idler rolls. By introducing the tandem arrangement, sizing takes place and the bar also obtains a triple straightening under heavy pressure. The rolls on the machine are of file hardness, assuring a long life, and, in addition to descaling and rounding up and straightening, give the bar a smooth finish. The tandem arrangement is necessary to make possible the rounding-up features, on the score that sizing is not easily accomplished by repeated passes through a single machine.

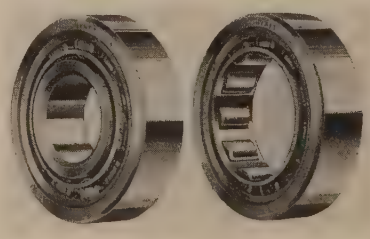
The operation is performed at the rate of 150 to 300 ft. per min., and the work is done cold without reheating. The operation is also continuous, as the bars automatically roll away from the leaving end of the machine without manual labor. The unit can be operated by one man. The machine will make possible the production of hot bars of straightness and accuracy not found in ordinary bars and where scale is objectionable on account of the wear on tools.

Single-Row Radial Roller Bearing

SINGLE-ROW radial bearings made up of solid rollers and designed to interchange with standard S.A.E. single-row ball bearings are being manufactured by the Hyatt Roller Bearing Co., Newark, N. J. This new line is not intended to replace the standard Hyatt roller bearing, which uses spirally wound rollers, but is offered as a supplement to it, for positions in which space limitations exist and loads beyond the capacity of ball bearings must nevertheless be sustained.

In this design the rollers are permanently retained in the outer race, the inner race being separable. A separator that floats on the rollers spaces them properly, and heat-treated rings retain them endwise within the outer races. The end rings and separator function to keep the rollers in proper alinement, assuring positive contact along their full length.

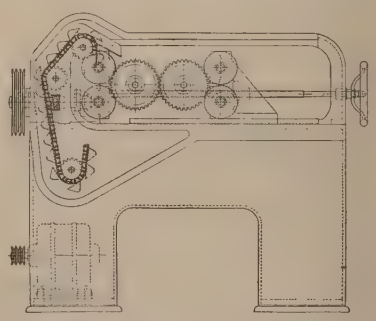
Rollers and races are made of chrome-nickel steel and end rings are made of vanadium steel to eliminate wear. Roller ends are rounded to facilitate assembly where the inner race is not used, and both outer and inner races are chamfered at one end.



Gear Lapping Machine

THE Lehmann Machine Co., St. Louis, has placed on the market a machine for lapping the teeth of gears, especially hardened gears, to the shape necessary for smooth running.

The functions of the machine are based on corrective abrasion governed by the restraining movements of round disks under pressure contact. It consists primarily of two spindles upon the outer ends of which are secured the mating gears to be lapped. These spindles carry hardened friction rolls of the pitch diameter of the gears being lapped, and are driven by contact with rolls on the driving spindles. Two of these driving spindles are journaled in a head which can be adjusted to bring the gear-carrying spindles together until their hardened rolls are under pressure contact, and the position of the mating gears is limited to the correct center distance. The pressure on the disks, necessary for the desired effect, reacts on eight large ball bearings in which the friction rolls are journaled. While the gears govern the general relative movement, the disks resist any departure from their normal movement. Oil and abrasive are fed to the gears being lapped.



Gears Are Lapped to the Shape Necessary for Smooth Running

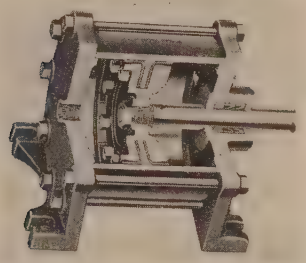
Absolute exactness in the diameter of the disks is always lacking to a degree sufficient to cause a slight departure from the correct relative general movements. This difference results in a continuous pressure on one side of the gear teeth, at first effective only on such irregularities as project beyond the correct tooth curves. Under the abrasive action the projecting irregularities become less and less pronounced until the desired smoothness of action is developed. A reversal in the direction of rotation brings the other sides of the teeth in contact with the same results.

The machine will be demonstrated at the Machine Tool Exposition to be held in Cleveland, Sept. 30--Oct. 4.

Self-Adjusting Non-Rotating Air Cylinders

NON-ROTATING double-acting air cylinders that are self-adjusting by air packing, thus eliminating the necessity for making hand adjustments, are being offered by the Logansport Machine Co., Logansport, Ind.

Air entering a recess in the packing serves to expand the packing against the cylinder wall, the gland packing being similarly expanded

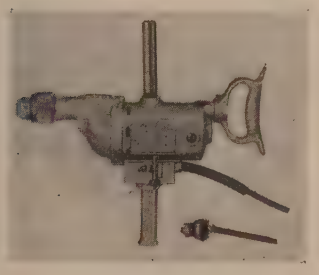


The Cylinders Are Self-Adjusted by Air Packing, Eliminating Hand Adjustments

against the piston rod. In addition, the new cylinders, while retaining the design and principal dimensions of the original Logan cylinder, are made heavier to permit higher air pressures, and have an enlarged air inlet and outlet, which provides for more rapid operation. For use in operating jigs and fixtures, raising platforms, etc, these cylinders are made in five standard models and in 11 sizes having bore diameters ranging from 1½ to 6 in. and with any length of stroke.

Light-Weight 5/8-In. Portable Drill

THE Wodak Electric Tool Corporation, 4627 West Huron Street, Chicago, has brought out a new portable electric drill which has capacity for



A Bench Stand Is Made for Use With the Drill

drilling up to ⅝ in. in steel and 2 in. in wood.

The machine is equipped with a General Electric motor and a conveniently located oversize double-pole switch. Shafts are mounted on ball bearings and heavy thrust loads are carried by Timken roller bearings. Other features include hardened steel gears, grease compartments designed for long periods of operation without refilling, and oversize ventilating fan.

To Demonstrate Milling of Airplane Engine Parts

THE entire exhibit of the Kearney & Trecker Corporation, Milwaukee, at the Machine Tool Builders Exposition, to be held at the Public Auditorium, Cleveland, Sept. 30 to Oct. 4, will be devoted to applications of milling machines in the airplane engine industry. In addition, a Curtiss amphibian plane has been engaged for transporting customers to and from the exposition, and for sightseeing trips over Cleveland.

Full-size airplanes, including the Wright nine-cylinder Whirlwind, will be on view. The Wright engine will be cut away and sectioned and driven by an electric motor to show operation of the master and baby rods and the movement of the pistons. A 525-hp. Pratt & Whitney Wasp engine and a Curtiss Challenger, a duplicate of the one used in Curtiss-Robin plane that recently established the endurance record at St. Louis, will also be displayed. A full-size General Electric airport beacon light with its beams revolving toward the ceiling will add emphasis to the aviation keynote of the exhibit.

Four milling machines, including a new bridge-type Mil-Waukee-Mil tooled for milling Wright engine crankcases, will be in operation. A 1404 Mil-Waukee-Mil equipped with a rise-and-fall fixture will mill the contour of Curtiss master rods, and a No. 2 standard vertical miller with "skip stop" rotary table will be in operation on the ends of Pratt & Whitney Wasp articulator rods. Small connecting rods for Harley-Davidson engines will be machined on a No. 2 standard horizontal miller. A large number of samples of other milled airplane engine parts will be displayed in two showcases, and display boards showing photographs of over 300 applications of the company's machines to airplane engine work will be on view.

Some 17,000 special invitations to visit the company's exhibit are being sent by air mail. Arrangements have been made to have an air mail post box in the company's booth, and air mail post cards and postage will be supplied to visitors.

The amphibian plane, chartered from the Curtiss Flying Service, Inc., will operate from the water front airport at the foot of Ninth Street, making flights over Cleveland every 20 min.

Demco Drilling Machine Co., division of Merit Equipment Corporation, Cleveland, has appointed Commercial Tool Co., Cleveland, exclusive agent in Cleveland territory for Demco high-speed sensitive drilling machines.

Releasing Die Holder for B. & S. Screw Machines

THE Brown & Sharpe Mfg. Co., Providence, has developed a releasing die holder for use with acorn dies on its No. 00 and No. 00G automatic screw machines. In holding the thread within a definite length the device is of advantage when threading close to a shoulder. The length of thread is governed by the adjustable screw on the front of the holder, which comes in contact with the chuck

The Device Holds Threads to a Definite Length

guard over the nose of the spindle. The body of the tool is 1 7/16 in. long. The shank is ⅝ in. in diameter and 1⅛ in. long.

Furnace for Bright Annealing Small Parts

A SMALL continuous furnace for bright annealing and soldering small parts made of precious and semi-precious metals has been placed on the market by Brandt Engineering Corporation, 71 West Forty-fifth Street, New York. It has a long muffle with doors at each end, set in a furnace casing and heated with city gas. A slightly reducing atmosphere is maintained inside the muffle and the gases of combustion are excluded therefrom. The work is placed on trays and pushed through the furnace, going through a definite heating and cooling cycle, and eventually removed at a low temperature. Parts having a light tarnish, or blackened by a blow torch, emerge bright and free from oxide.

It is said that heat treating in such a controlled atmosphere eliminates the necessity for the customary "bright dip" into some acid, and effects a corresponding reduction in cost. Furthermore it is possible to do hard soldering on a mass-production scale by merely placing the parts in proper position, placing a little hard solder on the joint and passing them through the furnace, heated to a temperature slightly above the melting point of the solder. The reducing gases inside the muffle remove any oxide which exists, thus avoiding the necessity for flux, and the solder melts and spreads itself into the joint and fine adjoining crevices.

Holds Manganese Meeting in Washington

Association of Producers Devotes Annual Convention Largely to Tariff Question

WASHINGTON, Sept. 10.—With an attendance of about 50 members, the second annual convention of the American Manganese Producers' Association was held here at the Hotel Mayflower, starting yesterday and coming to an end today.

The tariff was the main theme of discussion at the meeting. "On the question of tariff hangs the destiny of the manganese industry," declared J. Carson Adkerson, who, as president of the American Manganese Producers' Association, declared the address of welcome. He took occasion to express thanks to Senator Oddie, of Nevada, and Representative Williamson, of South Dakota, for leading the fight to provide protection for the domestic industry. At the same time there were spirited attacks made on those who opposed making manganese ore dutiable and a sense of deep disappointment that the Senate Finance Committee had transferred manganese ore to the free list. It was evident that the association proposes to do all in its power to have it restored to the dutiable list.

In the course of reports from manganese districts, Dr. J. S. Grasty mentioned manganese deposits in different sections of Virginia, and in speaking of the Mineral Ridge occurrence, said: "At the present time the Hon. James W. Gerard, former ambassador to Germany, is also interested in the property. His thought regarding it, as he expressed it to me, was not a question of tonnage, as that had been convincingly demonstrated. He was concerned, however, with the question of how to market this, or any other American manganese ore, in view of the attitude of the steel companies."

President K. M. Leute, General Manganese Corporation, Detroit, said that his company is in possession of a process that "enables us to beneficiate this low grade ore to a product containing approximately 70 per cent manganese, 29 per cent oxygen and less than 0.01 per cent phosphorus. "With any assurance of a price of around 65c. a unit at the furnaces, which can be expected under Senator Oddie's amendment, we expect our property to shortly become an important producer of this raw material," he added.

"The Use of Manganese in Agriculture" was the subject of a paper presented by Dr. Oswald Schreiner, chief, division of soil fertility, Bureau of Chemistry and Soils, Department of Agriculture.

At an informal dinner last evening, Senator Henry F. Ashurst, of Arizona, presided as toastmaster, while William B. Daly, manager of mines, Anaconda Copper Mining Co., was the principal speaker. Among those present were seven United States Senators.

Technical papers, describing different processes of beneficiation, made up the program this morning, while the afternoon session was devoted to economic phases of the manganese industry and an address by Senator Oddie.

Board of Directors Enlarged

Officers were reelected as follows: President, J. Carson Adkerson, Hy-Grade Manganese Co., Woodstock, Va.; first vice-president, John H. Cole, president, Domestic Manganese & Development Co., Butte, Mont.; treasurer, A. J. Seligman, president, Butte Copper & Zinc Co., New York; secretary, H. A. Pumpelly, vice-president, Domestic Manganese & Development Co., Owego, N. Y.

The executive committee also was reelected, and consists of Mr. Adkerson, chairman; Richard H. Brown, president, Manhattan Electrical Supply Co., New York; Mr. Pumpelly; Mr. Seligman, and D. H. McCloskey, Jersey City, N. J.

The board of directors was reelected and nine members added, the new members being K. M. Leute, president, General Manganese Corporation, Detroit; Leslie L. Savaga, president, U. & S. Mining & Development Co., New York; James W. Gerard, New York; Col. George W. Steele, president, Brunswick Terminal & Railway Securities Co., New York; Wilson Bradley, president, Bradley-Fitch Co., Deerwood, Minn.; C. L. Berrien, general superintendent of mines, Anaconda Copper Mining Co.; G. P. Goodier, president, New Mexico Copper & Mining Co.; Homer C. Chapin, Chapin Exploration Co., and M. C. Lake, geologist, Duluth, Minn.

Open Meeting on Steel Metallurgy

Program of Metallurgical and Mining Advisory Board's Conference at Pittsburgh, Oct. 18

PROGRESS being made in metallurgical research and problems vital to the steel industry will be discussed at the third open meeting of the Metallurgical and Mining Advisory Boards to the Carnegie Institute of Technology and the United States Bureau of Mines to be held on Oct. 18 in the auditorium of the United States Bureau of Mines, 4800 Forbes Street, Pittsburgh.

Leading metallurgists and steel research engineers from all over the country will attend the all-day meeting which will be open to all persons interested. Illustrated progress reports will be given by research engineers of the Carnegie Institute of Technology and the Bureau of Mines.

At the morning session, 10 a.m., Dr. V. N. Krivobok, associate of the Bureau of Metallurgical Research, Carnegie Institute of Technology, and Dr. G. H. Herty, Jr., physical chemist of the Bureau of Mines, will offer an illustrated report on "Case Carburizing Research."

Dr. F. M. Walters, Jr., director of the Bureau of Metallurgical Research, Carnegie Institute of Technology, will deliver a report on the preparation of iron-carbon-manganese alloys. Dr. J. B. Friuf, a third member of the Carnegie research workers, will deliver a talk on the preparation of pure manganese, a process which was worked out in the Carnegie laboratory.

"The Physical Chemistry of Steel Making" will be the topic during the afternoon meeting. Doctor Herty will give an illustrated report on the fundamental studies carried on in the bureau's laboratory. Later in the meeting he will offer another report on plant research in open-hearth treatment.

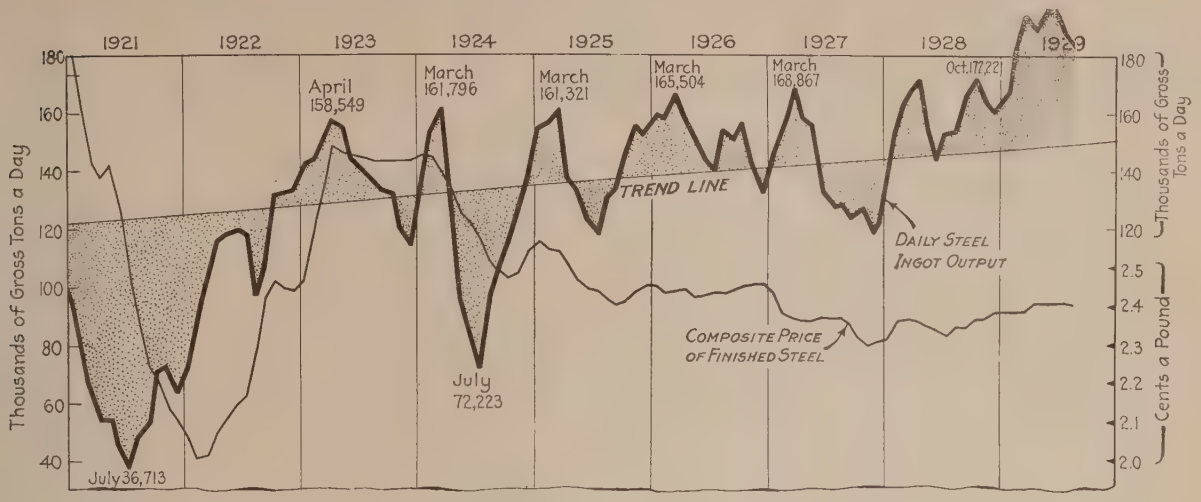
F. N. Speller, director, department of metallurgy and research, National Tube Co., who was elected chairman of the board last year, will preside at the day sessions. A. C. Fieldner, chief engineer, Experiment Stations Division, Bureau of Mines, Washington, will make the introductory address at the afternoon session.

The various reports will be interspersed with discussions. Among the speakers included in these discussions will be: O. E. Harder, director, department of metallurgy, University of Minnesota; W. J. Merten, metallurgical engineer, Westinghouse Electric & Mfg. Co., Pittsburgh; Louis Jordan, chief, section of chemical metallurgy, Bureau of Standards; Dr. H. W. Gillett, director of the Battelle Memorial Foundation; P. H. Brace, section engineer, metallurgical research department, Westinghouse Electric & Mfg. Co.; John A. Mathews, vice-president, Crucible Steel Co. of America.

The afternoon discussion group will include Dr. John Johnston, director, department of research and technology, United States Steel Corporation; R. J. Wysor, general manager, Jones & Laughlin Steel Corporation; A. L. Field, Simonds Saw & Steel Co.; Dr. George B. Waterhouse, director, department of metallurgy, Massachusetts Institute of Technology; H. B. Hubbard, superintendent, open-hearth department, Inland Steel Co.; V. B. Browne, assistant to the president, Allegheny Steel Co., and G. D. Tranter, superintendent, open-hearth department, American Rolling Mill Co.

The advisory boards were organized in 1923 by Doctor Baker "for the purpose of bringing the department of metallurgy at the Carnegie Institute of Technology in closer touch with the industries and to help the department to increase its usefulness and service."

Ingot Production in August Was 6.6 Per Cent Below the Record-Breaking Daily Rate of May. The trend line shows a normal growth of about 1,013,000 tons a year. Prices in August were 2 per cent better than at midyear of 1928



Largest August Steel Ingot Production

Greatest Ever Made in Any Second-Half Month—Daily Rate Lowest Since February—Eight Months 18 Per Cent Above 1928

PRODUCTION of steel ingots in August exceeded the July output by nearly 2 per cent, but there was a reduction of about 2 per cent in the daily rate, as there were 27 working days in August, against 26 in July, according to returns to the American Iron and Steel Institute. The total, calculated on returns from companies which made 94.51 per cent of the 1928 output, was 4,925,802 gross tons of open-hearth and Bessemer ingots. This total has been exceeded by only three months in all the history of the steel industry of the United States—March, April and May of this year. The daily average, at 182,437 tons, was smaller than those of the five preceding months, but otherwise the highest ever made.

Both open-hearth and Bessemer tonnage showed gains in August compared with July. These gains were greater in the Bessemer column than in open-hearth, having been almost 3 per cent against less than 2 per cent. The August open-hearth tonnage, in fact, was slightly less than that in June, whereas the August Bessemer tonnage was 7 per cent above that of June, and ranked highest for any month since March, 1924, with the exception of last May.

Aggregate output of Bessemer and open-hearth ingots in the eight months is calculated at 38,731,069 tons. This is 18.1 per cent ahead of last year's eight-month total, which was the largest ever reported previously. Incidentally, the eight-month tonnage of 1929 is greater than was ever before made in the first nine months of any year and is greater than was ever before made in the first 10 months of any year preceding 1926.

Electric and crucible ingots are not included in the above totals. Production of those two types of steel last year averaged about 1480 tons a day. Some such amount would have to be added to the daily figures in the table to obtain the total ingot output of the country.

Particulars for the past 20 months are shown in the table. The diagram traces the course of ingot production and finished steel prices over the period from the beginning of 1921.

PRODUCTION OF OPEN-HEARTH AND BESSEMER STEEL INGOTS
(GROSS TONS)

1928 Months	Reported by Companies Which Made 94.51 Per Cent of the Steel Ingots in 1928		Calculated Monthly Output All Companies	No. of Working Days	Approximate Daily Output All Companies

Eight months...	31,680,755	4,923,979	38,731,069	208	186,207

Orders were placed in July for 2052 steel boilers, with 2,081,199 sq. ft. of surface, against 1685, with 1,822,799 sq. ft., in June, according to reports received by the Department of Commerce from 80 manufacturers. For the first seven months of the current year orders were placed for 10,777 boilers, with 11,825,051 sq. ft., as compared with 11,099, with 10,272,539 sq. ft., for the corresponding period of last year.

BOOK REVIEWS

The Revolution in Industry

Industrial Economics. By Dexter S. Kimball, professor of industrial engineering and dean of the College of Engineering, Cornell University. 312 pages, 6 x 9¼ in. McGraw-Hill Book Co., Inc., New York. Price $3.

Intelligence consists in taking into account all the elements in a situation, and the industrial scene has been steadily advancing in complexity since, at the end of the 18th century, seven basic mechanical inventions—five in England and two in the United States—started the long drawn-out change called the Industrial Revolution. Not, however, until the opening of the 20th century was a real attempt made to study this phenomenon in all of its manifestations, scientifically to isolate, measure and relate its elements, and by generalizing about them to lay the foundations of an industrial economy.

Doctor Kimball's book is an up-to-date account of the result, four chapters or about one-fifth of its 300 pages being devoted to a preliminary sketch of the historical background of modern industry. The five chapters that follow are a fine example of logical development and deal with the basic principles of scientific method in industry, with specialization, modern division of labor, classification of costs, production factors and standardization. The examples are naturally drawn, chiefly from the machine shop industries which pioneered in these matters; but the book is not too technical for the general reader, while a valuable adjunct to the teacher and student.

The second half of the book deals adequately with the growth of American industry and with the problems arising out of its enormous scale, increasing mechanization, mass production, mass management and mass organization and progressing integration.

Finally, there is an up-to-date discussion of the measures of management—financial, budgeting, labor saving, and production quality and quantity. We are pleased to note on page 255 the warning that the Taylor system is subject to the law of diminishing returns, like any other economic mechanism, and also that the author lays squarely on the shoulders of employers their responsibility for the unpleasant consequences to the worker of sudden technological changes. While capital and management are very fully studied in their relation to industrial economics, we note the absence of any such recognition of the other side of the payroll; of labor's reservation of the right to make its own mistakes, of its insistence upon status, and of the serious consequences on industrial economics of refusal.

JOHN CALDER.

Continental Wire Making

Draht-Welt-Buch. Edited and published by Martin Boerner, Halle (Salle), Germany. Second edition, 1000 pages, 6 x 9 in.

The reviewer approached this book in the spirit in which one would go to see the performing sea lions, that is, not expecting to see a thing well done, but prepared to be amazed at seeing it done at all. The reviewer was in this case pleasantly disappointed. The thing is well done. Herr Boerner has, with enormous industry, amassed a great volume of data on wire drawing and the manufacture of the commoner wire products, has arranged it logically, illustrated it copiously and summarized it in numerous well-arranged and clearly understandable tables. If its accuracy is of the same order as the patience and industry expended in the collection and arrangement of the material, the book is a notable achievement and should be highly appreciated throughout Germany and Continental Europe.

It is doubtless vulnerable to the usual criticism that it tells all the things you know and fails to explain those you don't know. It must be remembered, however, that wire drawing is just now emerging from the jungle of mystery and secrecy, and that it is at best an art of infinite detail and one which makes greater demands on its raw material than any other of the metal-working arts. Wire drawing itself is a continuous and searching test of all properties of metal and is undoubtedly the most difficult art to reduce to formula and to standard practice. Granting that the present book may be inaccurate in some detail, granting that it may explain the obvious and neglect the obscure, it still stands as a real achievement. It will, at the very least, serve as a sort of lay figure which may in later years be more completely and becomingly draped. As a matter of fact, the American wire industry lacks such an outline.

The book opens with a brief historical review and a description of rod mills of all types. Pickling data follow, with notes on inhibitors and much detailed information on the recovery of ferrous sulphate. Baking receives adequate notice, although it is a "fancy touch" in Europe rather than a necessity, as in American practice. Dies and general wire drawing practice are described in detail with tables setting forth drawing practice for many grades of wire both common and special, as well as block speeds and diameters, horsepower, and production per man under various conditions. Low-carbon wire, together with annealing, takes 170 pages. Galvanizing receives 40 pages, and is followed by a section on galvanized strand. Nails, tacks, wood screws and other cold headed products receive detailed treatment. Barbed wire gets 25 pages. Netting, hexagon mesh and other loom products are reviewed in much detail in 70 pages. Chain and general hardware fill 40 pages. All these sections are profusely illustrated, and all information carefully tabulated. Even building layout and spacing of machines and aisles are covered.

Thirty pages are devoted to the theoretical side of cold working as an introduction to a section on patenting and the manufacture of rope and other high-carbon wire products. The last 200 pages are devoted to the non-ferrous metals and to such special subjects as plating with brass, nickel, cadmium and chromium. There is a good general index and 17 pages of the most complete bibliography the present writer has ever seen.

A word of warning is necessary at this point. Interesting as the book is, it contains little or nothing of practical value to the American wire producer. This is because of the fundamental difference between wire-drawing practice in Germany and in America. America and Great Britain follow the dry practice, resorting to wet drawing only in special cases; Europe, on the other hand, reserves the dry process for special cases. Typical European practice is to reduce a lightly limed and unbaked number 6 gage rod two drafts to 10 gage. At this point it is passed to the "middle man" who draws it wet to 14 or 15 and passes it on. The middle man uses more cosmetics than a Hollywood beauty. He has a special dope for removing the dry drawn coat; a special liquor for establishing the copper coat and a third liquor for

lubricant. These liquids differ in composition for various grades of wire, as do also the corresponding baths used by the 15 frame men and the fine wire drawers. Details of their composition and preparation are faithfully recorded in the book.

These various treatments are hand operations. They cramp the production of the wire drawer, and they restrict him to small bundles, which further cripples his productivity. Wet drawing restricts him to relatively light drafts. Output per man ranges 50 to 60 per cent of the American output in single-hole work, and 25 to 30 per cent of the American continuous machine output. The handicap imposed by small bundles carries over into the nail and fence mills, where for this and other reasons production lags far behind the American figure. Nail wire is usually drawn dry, even abroad, because dry wire is much easier on the cutting dies.

American readers will note many interesting differences in practice, apart from those imposed by the wet process. Card wire seems to be produced from low-carbon as well as from high-carbon steel, a drawing practice being indicated for each. Furniture springs are described as drawn from low-carbon rods which have been stiffened by coiling under water at the rod mill. In this country low-carbon springs are believed to be obsolete. Rope wire and similar grades appear to be nearly always drawn one draft from the green rod before the first heat treatment. There is some pot annealing in these grades and a sort of non-continuous patenting, secured by dumping bundles from a muffle furnace into a lead pot. There is a tendency to reserve continuous patenting as a final treatment before the last series of drafts. In general, labor is wasted and fuel scrupulously saved.

Any American wire mill executive who has a reading knowledge of German will find this book entertaining. It is well written, so far as a foreigner can judge, and entirely free from the involved structure characteristic of much technical and literary German. As technical German goes, it is very easy reading. The book is well edited and practically free from typographical errors.

It is a relief to find one detail deserving of criticism. The binding is flimsy, scarcely likely to survive one thorough reading.

—K. B. Lewis.

A Source Book on Industrial Economics

History of Manufactures in the United States. Vol I, 1607 to 1860. By Victor S. Clark. 607 pages, 6¾ x 10 in. Published for the Carnegie Institution of Washington by McGraw-Hill Book Co., Inc., New York. Price $7.50.

Emphasis should be laid on the fact that the important work by Mr. Clark is neither a technological, a mechanical nor a biographical book, but an economic history in the strictest sense of the word; it is a new and enlarged edition, based on original material, the fruit of researches since 1904. As a history, it commences with the influence of natural resources, transportation, markets, and the European background on colonial manufactures; it describes the relations of capital and labor to the progress of early manufacturing and its technology and organization. Political propaganda concerning home industry and manufactures during our Revolution, and subsequent foreign influences, are thoroughly treated. Chapter XV, on Capital, Profits and Wages in Manufactures, naturally treats on the early commercial conditions affecting manufacturers, the sources of industrial capital, manufacturing profits and commercial crises such as those from 1815 to 1826, 1837 to 1840, and 1857 to 1861.

The flood of imported goods after the War of 1812 suspended many local industries, especially in textile lines. Mention is made of the irretrievable ruin of those mill-owners who held on in an advancing market in the hope of still higher prices, hope blasted by the declaration of peace. That in 1822 many typical Philadelphia four-story houses with marble steps were sold for a dollar apiece (being on leased ground) will be news to many.

The 1857 crisis paled before the general upset caused by our Civil War, at which time, however, our manufacturers had not only accumulations of resources, but no debts to Government for duties, as in 1837.

The introduction of the factory system makes an interesting chapter; and in subsequent sections there are grouped a consideration of wood-using manufacturers, agricultural implements, and industries using farm products as raw materials; while the manufacture of metals and the textile industries are given separate chapters.

In all these pages there is interesting and profitable reading for those who wish to reason from cause to effect and on to after-effect.

Each reader had best make his own review and application of this valuable compilation, as best throwing light upon his own economic problems.

Robert Grimshaw.

Steels for High Temperatures and Pressures

Creep of Steel at High Temperatures. By F. H. Norton. 83 pages, 6 x 9¼ in., illustrated. McGraw-Hill Book Co., Inc., New York. Price $3.

This book is really a treatise covering the results obtained in testing a number of steels at elevated temperatures for the Babcock & Wilcox Co. The author is a Research Fellow at the Massachusetts Institute of Technology, the work having been carried out in the Department of Physics of that Institute. The steels tested were of three types: (1) austenitic nickel-chromium; (2) chromium steels of the stainless type; and (3) plain carbon and pearlitic alloy steels.

Generally speaking, the method used by the author for determining the deformation of steel under constant load for long periods of time at elevated temperatures is essentially the same as that in current use in tests of this kind, but differs somewhat in detail—as is usually the case. The amount of laboratory space required for furnaces and controls of long-time creep testing at elevated temperatures is considerable, and depends on the number of temperatures at which the material is to be tested and the number of loads applied at each of the temperatures. The author has cut down the usual number of furnaces by an arrangement in which as many as six specimens may be heated at once in the same furnace and different loads applied to each one. As a rule, other investigators have used a furnace for each load. For practical purposes the method used by Norton has a very strong appeal from the point of view of both economy of space and of funds. For very precise work it may be that the method is questionable. Measurements of elongation were taken with an accuracy of 0.0001 in., which, for long-time testing, seems amply accurate.

The results appear to be as accurate as any long-time test results the reviewer has seen published. The author gives several pages to the results of others with which he finds himself generally in fair agreement. It is not to be expected that different investigators will find close agreement in all their work, particularly when the initial condition of the material tested is unknown. This is one point which may be criticized in the present case, the initial condition of the material being given in only very general terms, excepting perhaps in the carbon and structural pearlitic alloy steels.

The material in the book is well, although perhaps too concisely, presented. Nevertheless, it is a valuable addition to the literature and data on the subject. One chapter is given over to a well selected bibliography bearing on the flow of metals.

F. B. Foley.

Guide Posts for Association Activities

Trade Associations. The Legal Aspects. By Benjamin S. Kirsh. 271 pages, 6 x 9 in., including references and index. Central Book Co., New York. Price, $5.

Mr. Kirsh takes a surprisingly friendly and liberal attitude toward trade associations in this book, when it is remembered that he was at one time special assistant to the United States attorney in New York. In this capacity he actively prosecuted many cases under the anti-trust laws, wherein trade associations have been defendants almost as often as single companies. One gains an impression from the book that trade associations of today are quite different from their predecessors, the pools, trusts, communities of interest, and holding companies, and that within the law there is a very definite place for them in the industrial structure. And he has clearly interpreted the laws governing organized cooperative industrial effort.

By means of decisions made by the courts, Mr. Kirsh points out the legal limitations of trade associations in the collection and dissemination of statistics; of uniform cost accounting methods; of credit bureau functions; of patent interchange; of uniform basing point systems; of collective purchasing functions and of standardization. He also has devoted chapters to trade relations and to the restrictions of channels of distribution.

In view of the prolonged action by the Federal Trade Commission seeking to abolish Pittsburgh Plus quotations on steel products, the chapter on uniform basing point systems will be interesting to steel manufacturers, although the author has derived most of his data from decisions in cases relating to other industries.

"Where the purpose of such a plan" (uniform basing point), says Mr. Kirsh, "is to present in simplified, convenient and readily available form, the costs of transportation to various points of consumption, such a function, and the means reasonably adopted to accomplish that end, have received the stamp of judicial approval. * * * The inquiry by law, as to possible violations of anti-trust statutes by the operation of uniform basing points systems, relates to their use as instrumentalities in agreements among the members of the association to fix a deliberate price of commodity at a minimum figure."

Viewed as a whole, the volume is a welcome addition to the rather scant literature of trade association activities. It not only epitomizes the important cases brought under anti-trust laws, but from the decisions the author has established several channel markers for safe legal sailing. The book is likely to find liberal use as a reference, because it has so completely covered the legal phases of trade associations.

G. F. Tegan.

An Elementary Text on Iron Founding

Foundry Practice. A Text Book for Executives, Molders, Students and Apprentices. By R. H. Palmer. Pages 450, 5½ x 8¼ in., illustrated. John Wiley & Sons, Inc., New York. Price, $3.50.

The fourth edition of this work dealing with the fundamentals of the foundry art is a very satisfactory volume to place in the hands of beginners, due to clarity of the description of the basic principles and the absence of involved technicalities. The scope of the text is limited, in that it deals chiefly with only one division of the foundry trade classified as heavy gray iron jobbing work. Steel, malleable and brass foundry practice is covered in 17 pages, with little information of practical value.

Methods of mass production requiring highly mechanized equipment for materials handling are not discussed. Cost methods, programs for the improvement in production of the quantity and quality of castings, as well as methods of technical control of materials and processes are also omitted. As the development of the foundry art in the future will depend on these factors, it may be regretted that this and other texts do not inspire the student by some appreciation of them.

The author has approached the problem of developing a method of instruction with a sure and firm hand. There is no lost motion in the presentation of facts regarding molding and cupola operation. Neither has he surrounded the metallurgy with a halo of mystery and quack chemical terms. Such treatment is a relief from that of the average writer who may approach the subject from the practical side.

W. F. Graham.

Notes on New Books

Ninth Year Book of the American Bureau of Metal Statistics has been issued at 33 Rector Street, New York. It contains tabulations (often in great detail) of the source and destination of copper, lead, zinc, gold and silver throughout the world since 1917. The 112-page book, whose price is $2, is compiled from reports issued by the bureau monthly and quarterly, much of the data being derived from original sources. The American Bureau of Metal Statistics is maintained by American non-ferrous metal producers, but the statistics are available to any interested person upon payment of moderate subscription.

A Visitors' Manual of the National Bureau of Standards has been issued by that organization in the shape of a 16-page pamphlet of pocket size, concerning the activities of the bureau, showing its location in the city of Washington and the location of the numerous buildings in the group. The main points of interest for a visitor are brought out in convenient form for reference.

Some of the conditions under which a conveyor system might be made a profitable investment are outlined in a book under the title "Conveyor Facts," published by Mechanical Handling Systems, Inc., Detroit, and written by Norman H. Preble of that organization. Two elementary principles are brought out as follows: (1) "In handling materials perform only those handling operations which are absolutely necessary; and (2) perform these operations in the way that secures the lowest cost." Both of these principles are subject to analysis and each application of them are subject to careful study of the situation at hand, one may then determine what constitutes the handling problem, and how the lowest cost may be achieved.

Value of a special safety campaign is realized in reducing the number of industrial accidents, and usually the money expended in propaganda is recovered by the saving in compensation and medical expense. The effect upon employees is also good. The spirit of competition, which is always made use of, stimulates the employee's loyalty to the company and builds up an excellent plant spirit. These beneficial results are discussed in pamphlet No. 51, "Planning an Industrial Safety Campaign," issued by the National Safety Council, Washington.

New Books Received

Handbook of Corporate Management and Procedure. By Earl A. Saliers. 1237 pages, 6 x 8½ in. McGraw-Hill Book Co., Inc., New York. Price, $7.50.

Transactions of the American Institute of Mining and Metallurgical Engineers, Institute of Metals Division. 1929 pages, 6 x 9¼ in., illustrated. Published by the Institute, 29 West Thirty-ninth Street, New York.

Vielschnittbänke. By Max Kurrein. 114 pages, 7 x 10 in., illustrated. Guido Hackebeil, Stallschreiberstrasse 34, Berlin, S 14, Germany. Price, 15 m.

This Issue in Brief

Cuts heat-treating costs by connecting furnaces and quenching tank in an automatic unit. Two men do work formerly done by 12. Three large furnaces are set in straight line, joined by conveying system. By altering time cycles and temperatures any kind of material can be treated.—Page 663.

* * *

Handy stacking rack makes it possible for one man to pick up and store a carload of tubing in a half-day. Tubes are hand-loaded into rack, consisting of two U-shaped bars. The loaded rack is lifted by hoist mounted on overhead tramrail and set down in storeroom. Aisles between loads are not needed.—Page 666.

* * *

Production increased from 10 to 25 per cent and spoiled goods reduced by adequate lighting. Investigations reveal that good light is a powerful aid to economical production and a positive reducer of industrial accidents.—Page 670.

* * *

Marked savings made by using oil instead of gas as open-hearth fuel. Steel mill cuts costs by buying residual heavy oil from refinery. Special class instruction of furnacemen avoids greater refractory expense upon changing over to oil fuel.—Page 671.

* * *

Cast irons of less than 3 per cent carbon show no improvement in physical properties when superheated, unless silicon content is high. Higher carbon irons have improved properties as superheat is raised from 1365 to 1480 deg. C., and then up to 1605 deg. C.—Page 674.

Cleaning cost is big item in manufacturing enameled parts. In some kinds of metal radiator cover work cleaning cost is sometimes 10 per cent of the total.—Page 673.

* * *

Welding is employed to alter old mill motors so that roller bearings may be installed. Total welding time per frame, to remove projections which might interfere with roller bearing cartridge, is 2.5 hr.—Page 677.

* * *

Unnecessary expense saddled on to building owners if roof is required to be as fire-resistant as the floor. Engineer contends that improved steel roof, having flat surface stiffened by ribs, provides adequate protection for any type of building.—Page 679.

* * *

Cheap foreign labor gives way to material-handling equipment. Chilean nitrate plant reduces costs sharply by installing labor-saving equipment and pays for the entire installation out of savings.—Page 668.

* * *

Working model proves an important factor in success of employee instruction class. Manufacturer gets such good results from course introduced temporarily, for an emergency purpose, that he is continuing it. Working model claims close attention of class members.—Page 671.

* * *

Labor wants most of all a good plant manager. Professional labor leader is usually ignorant of good management methods. Prosperous condition of American manual worker is due largely to what has been done for, not by, organized labor.—Page 690.

New August high ingot production record made with average daily output of 182,437 tons. Eight months' total is 18 per cent above same period of 1928.—Page 685.

* * *

Babson's faux pas reveals unsoundness of economists' prophecies. Statistics adequate for sound prognostication do not exist. Some business economists fail to recognize this fact, and are prone to confuse theory and hypothesis.—Page 690.

* * *

Doubles production, cuts labor costs 15 per cent, and reduces rejections 25 per cent by conveyorizing the lacquering operation. Conveyor seven-eighths of a mile long carries stamped parts through series of spray booths and drying ovens.—Page 659.

* * *

Achieves proper heat gradient in heat treating by dividing furnace into three zones: preheating, heating and soaking. Each zone has its automatic temperature control. Hot gases pass along toward charging end, giving their heat to the cold, incoming work. Page 664.

* * *

Heat-treated parts dumped into quench chute by unusual method. Trays of work, with a trunnion at each end, are mounted on three steel rails, and are supported by rails underneath. Supporting rails end at quench chute, so that the tray upsets, and trunnions ride on rails over-passing quench tank, to receive work at discharge end of tank.—Page 665.

* * *

Lighting costs should be about 2 to 4c. a sq. ft. a year for steel works buildings. Installation cost ranges from 5 to 10c. a sq. ft., depending upon class of work done.—Page 670.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

The Babson Episode

THERE were amusing features—notwithstanding a section of Wall Street grew indignant—in the direful prophecy of Mr. Babson, though unfortunate persons who unloaded stocks on his advice may not have the same appreciation of its humor as a disinterested bystander. The very next day came a contradictory prophecy from the mouth of Professor Irving Fisher, and there was something humorous in that also.

Mr. Babson and Professor Fisher both may be called eccentric economists. Professor Fisher is known for his extravagant conception of the quantitative theory of money and his well-advertised nostrum of a stabilized dollar. Mr. Babson, who has shown himself an extraordinary salesman, has made a great commercial success in capitalizing the principle that action and reaction are equal, in economics as well as in physics.

During the last two or three years, however, it has appeared that in our American economy action and reaction have not been equal—certainly not as measured on the babsonchart—and that has worried, we might say peeved, Mr. Babson. Nevertheless, if he continues long enough to preach the approach of a recession he may eventually find himself right.

Rather curiously in his last prognostication he naively refuted himself in drawing attention to the fact that the majority of stocks listed on the New York Stock Exchange are even now selling for less than at the beginning of this year, pointing out that the extraordinary advance has occurred in but relatively few. Hard-headed Wall Street, as soon as it caught its breath, promptly arrived at the conclusion that this indicated the absence of bubble-blowing and demonstrated that the stocks that had made great advances had done so for good reasons; in other words, that this has been a selective market, just as many authorities have been describing it all along.

There is a real lesson in the recent Babson episode, to the effect that economists ought not to essay to be prophets. Science leads properly to prophecy. Indeed the final test of a theory is the ability to prophesy according to it. We should not, however, fall into confusion between theory and hypothesis, which economists appear to be especially prone to do. Economic science in its everyday contact with affairs does not know enough of facts. Adequate statistics, as we have said before, do not exist. It is unfortunate that the new profession of business economists is unwilling to recognize this and in some instances seems to tend toward charlatanry. Giving advice to the public either to buy stocks or to sell them certainly assumes a great responsibility.

Labor Day, 1929

IN its Labor Day speeches this year organized labor was complacent. It had good reason to be. In the whole history of the world the manual worker was never so well to do as he is in the United States of America at the present time. No one begrudges this. On the contrary every one rejoices that our toilers, who comprise about 99.9 per cent of us, are so comfortable and happy. But a word must be said, as one hears organized labor appropriating to itself the credit for this and talking of how it aims to extend the vogue of the five-day week (at six days' pay) and achieve other things.

The beneficence of the present American economy is the result of what has been done for labor, not by it. Indeed, the attitude of organized labor has been a good deal of a clog tied to our feet. The men who have done the thing are the scientists who have studied the laws of nature; the inventors who have utilized them in ingenious, often astounding, ways; the engineers who have practicalized the inventions and built works in which to exploit them; the executives who have organized the operation of the works; and the financiers who have furnished the resources. No labor leader ever did any of those things, but often they have joggled the elbows of the men who were doing them.

The men who have done these things and are continuing to do them are the very ones whom the politicians revile and have tried to cripple with restrictive legislation and have punished with surtaxing of their income, all reflecting jealousy of the failure of nature to create all men equal. The men who toil in our mines, mills and factories have a far better appreciation of this than do their professional leaders. Above all things they want a good manager of the plant in which it is their lot to work. The professional labor leader scarcely knows what a manager does.

Labor unions have never been creative. They operate rather in the division of the proceeds of industry, exacting for their members all that they can get. If they maintain a monopoly by agreement among themselves, as do the building mechanics of the Atlantic seaboard, they get a good deal both in the matters of wages and privileges. We may not blame them for such accomplishments, although they bear hardly upon persons who want to build houses and they raise the cost of rent in general. However, few of us are

altruistic. It is human nature for each to do the best for himself that he can. The labor leaders might be frank as to this and not claim virtues that they do not possess any more than other persons.

Steel Records Higher and Higher

JULY added over 1,000,000 tons to the record of steel ingot production in 12 consecutive months and now August has added 750,000 tons more, exceeding by approximately that amount the production of August, 1928. An impressive comparison is made with recent calendar year totals:

Total Steel Ingot Production

Calendar Years	Gross Tons
1926	46,936,205 (new record)
1927	43,776,717
1928	50,325,393 (new record)
12 months through:	
June, 1929	54,675,000 (new record)
July	55,570,000 " "
August	56,300,000 " "

It took two years, from 1926 to 1928, to raise the record by 3,400,000 tons. Now it has taken only two months to raise the record more than half as much.

Commentators in the financial columns of the daily press, noting that up to the end of August steel ingot production this year was about 6,000,000 tons more than in the first eight months of 1928, have predicted that the steel output of 1929 will exceed that of last year by 9,000,000 tons. That estimate is probably over-optimistic. It happens that the ingot production of the last four months of 1928 was about 52 per cent of that of the first eight months. But taking the average for the six years 1923-1928, inclusive, the last third provided only 48 per cent as much tonnage as the first two-thirds. If that proportion holds this year, open-hearth and Bessemer ingots should approximate 57,350,000 tons. Adding 550,000 tons for electric and crucible steel ingots, the total for the year would work out at about 57,900,000 tons, or 1,400,000 tons less than the 59,300,000 tons of the daily paper writers. That is, the output of this year would be approximately 15 per cent greater than that of 1928.

OVER-PRODUCTION, inflated prices and labor disputes do not appear in today's industrial picture; so it is commonly assumed that there is little to worry about in respect to business of the immediate future. But the doubting analyst now comes along and says, in effect: "Admitted, that manufacturers' inventories are not large, but is there not the same effect from the large volume of commodities in the hands of consumers buying on installments? Agreed, that prices have not followed upward the remarkable expansion in demand; but is not this the result of greatly enlarged capacity and does not the product of quantity and price really show inflation? To be sure, strikes are almost non-existent, but would not labor seek for more did not mechanization prevent a labor shortage?" The argument is faulty in several respects: It presupposes that installment buying extends over the whole gamut of production; it overlooks the checking influence of hand-to-mouth buying on price buoyancy; it ignores the fact that labor has a wider participation than ever in industrial enterprise and is not without the enjoyment of today's as well as yesterday's luxuries. The three items specified above by the skeptical analyst have ordinarily spelled recession and of course they need watching, especially if any one of them be disguised in the way suggested.

Automobile Consumption of Steel

PERHAPS the automobile industry's consumption of steel this year has been overestimated. From the successive annual findings of THE IRON AGE as to where steel went in the year it was long ago made clear that many popular impressions were erroneous, since our figures showed 10 per cent for 1922, increasing irregularly to a maximum of 18 per cent in 1928. There were many notions of much higher proportions —particularly in the city of Detroit.

The interesting point now is this year's proportion, which may be estimated roughly from last year's. The method naturally suggested is to compare automobile "production" last year and this with steel ingot production; but that provides only an approximation. A considerable proportion of last year's automobile steel did not go into the cars and trucks reported as produced, there being parts for replacement here and abroad, parts for foreign assembly, and accessories. Probably there was not so much growth in this consumption, outside the units produced, as there was in the number of units.

A comparison of the steel assigned to the automobile industry and the "production" of automobiles shows a steady and marked increase in the quantity of steel per unit. That is largely or wholly due to recent increases in the weight of many models, for when engines are made more powerful the car must be strengthened all around. Also there was the disappearance of the lightest car after May, 1927, with no large reappearance last year. In the first half of this year the Ford proportion was a trifle over 30 per cent, while at the present time it is close to 40 per cent. The average weight of the total car and truck production now is no doubt somewhat lower than last year's average.

For arithmetical excursions we have data as follows: In 1928, steel ingot production in the United States, 50,325,393 tons; assigned to the automobile industry by the manufacturers in reply to questionnaires, 18 per cent; car and truck production, United States and Canada, 4,601,141. First half of 1929: Ingot production 29,225,000 tons; automobile production, 3,411,753. By a simple pro-rating with these figures we obtain precisely 23 per cent as the automobile proportion of the steel in the first half of this year.

For automobile production in the last two months we have the official report of 517,792 for July and the National Automobile Chamber of Commerce statement of 516,522 for August. By a similar computation we obtain 20.7 per cent as the automobile proportion for July and August. Allowing for the increasing propor-

tion of Ford production one may take 20 per cent as the closest approximation available.

Relative to the total tonnage of steel the difference between 20 per cent and 23 per cent is not large. The 23 per cent is an average, and the peak in April was probably a trifle above 25 per cent.

There is no reason to suppose the percentages here computed are too low and they may be a trifle high. By an average of the last five years, automobile production has been substantially uniform in the four months July to October inclusive. In the last two months of the year it falls off, but the steel trade is accustomed to lighter demand all around at that time.

The Vogue of Lighter Cast Iron Pipe

IN an important foundry product the substitution of lighter material for heavier, without sacrifice of strength, is a development of the past three years. In 1926 the American Iron and Steel Institute reported 2,005,184 net tons as the production of cast iron pipe and fittings. At 1,872,000 tons in 1928 the decline in two years has been 6.5 per cent. An increase would reasonably be expected with the growth of the country and the extension of municipal gas and water lines. Imports have not increased. At 60,793 tons they were over 25 per cent less in 1928 than in 1926.

One explanation is that centrifugal pipe, which is much lighter per foot than sand cast, has displaced the latter to such an extent as to turn an apparent loss into an increase, so far as miles of pipe laid are concerned. There was more than twice as much centrifugal pipe cast in 1928 as in 1926, or about 425,000 tons against 200,000 tons, both figures being estimates. That is, the centrifugal pipe made in 1928 was 22.5 per cent of the total output of pipe, whereas in 1926 it was only 10 per cent. Thus, much the same change is gradually taking place in this field that has been so great a factor in steel, as represented in the case of the latter by the displacement of products long regarded as standard by light, strong alloy steels and aluminum alloys, all carefully heat treated.

To All These Add Courage

WITH the heading "Help Wanted—Male" the first editorial page of the Aug. 31 issue of the *Engineering and Mining Journal*, New York, is given up to a text-letter advertisement for a new staff man. The specifications, which the editor says are "meant to indicate a definite philosophy of occupation and not to serve as a description of the virtues of a paragon," are these:

> The qualifications of an engineer who seeks a career in technical journalism—beyond those that are obvious—are not easy to define, being complex and intangible. But such qualifications may be said to include the scientist's love for truth and accuracy; the engineer's ideal of efficiency and the avoidance of waste; the writer's respect for brevity and clarity; an evenness of temper that suffers, perhaps not gladly but without visible or expressed irritation, the actions and comments of those who bear out the truth of the saying that a little learning in any one subject, not excluding the business of publishing, may be dangerous; an intolerance of mediocre performance—not of mediocrity—without prejudice to a sense of personal humility; the journalist's recognition of the value of timeliness and an appreciation of the loss, moral as well as material, occasioned by procrastination; and the sane man's respect for the voluntary observance of those decent manners that lie midway between selfishly taking advantage of a liberty of opinion in expression, on the one hand, and having to submit to supervisory control or prohibition, on the other.

We do not remember to have seen any like exacting specification for the mental and moral outfit of one who might aspire to a career on the business rather than the editorial side of a technical publication. The absence of such a schedule does not argue for any indifference in respect to the equipment of those who promote the business interests of specialized journals. But when it does take form on the printed page we wonder just how far its author could venture were he to attempt to parallel this tribute of the *Engineering and Mining Journal* to the work of the technical journalist:

> No other field of human endeavor affords greater opportunities for that personal service and contribution to the social and industrial well-being of humanity, without which professional work lacks ethical appeal and justification.

CONGRATULATIONS to the *Ironmonger*, our British contemporary, which is now along with THE IRON AGE in its eighth decade. It was founded in 1859, four years after this journal, and has had a virile career, with an enviable record of reliability and helpfulness as well as robust independence.

CORRESPONDENCE

Return and Continuous Tumbling Barrels

To the Editor: We wish to call your attention to an error in the description of the tumbling barrels (in the plant of the Transue & Williams Steel Forging Corporation, THE IRON AGE, Sept. 5, page 601). You describe these as continuous tumbling barrels. These are very definitely not continuous, but are Ideal Star return tumbling barrels.

These barrels are so arranged that, when running in the tumbling direction, the work and stars are held in the tumbling compartment. When rotating in the discharge direction, the work is separated from the stars and discharged automatically. Rotating the drum again in the tumbling direction, returns the stars automatically to the tumbling compartment.

This is an entirely different machine from the continuous tumbling barrels, since it enables the work to be tumbled with an excess of stars. This causes the work to float in the stars, resulting in a more thorough and rapid cleaning and in preserving the corners of the parts from excessive rounding.

Acquire Control of Donner Steel Co.

Cyrus S. Eaton and Associates of Cleveland Buy 60 Per Cent of Stock—May Mean Merger With Republic

CLEVELAND, Sept. 10.—Cyrus S. Eaton and associates of Otis & Co., Cleveland investment bankers, have acquired control of the Donner Steel Co., Buffalo, by the purchase of 60 per cent of the stock. No statement is obtainable here as to the future of the Donner company, but officials of the Republic Iron & Steel Co. are known to have looked the plant over with a view to a possible merger with Republic.

The Donner company recently purchased ground adjacent to its plant for the building of a mill addition. Equipment to be installed is to round out the range of bar sizes produced by the company, especially alloy steel bars.

Negotiations for the purchase of the Union Drawn Steel Co. by the Republic Iron & Steel Co. are still in progress. It is stated that the merger will be effected by an exchange of stock, but no official statement has been issued as to the terms.

National Metal Congress Heavily Attended

Sessions of Four National Societies and Metal Exposition Attract Many, Including Prominent Foreigners

CLEVELAND, Sept. 10.—After a welcome by W. H. White, chairman of the Cleveland chapter of the American Society for Steel Treating, the eleventh National Metal Congress and Metal Exposition was formally opened yesterday morning by Dr. Zay Jeffries, Cleveland, president of the A. S. S. T. He, in turn, welcomed the other cooperating technical societies, four in all, and declared that this year's assemblage will be the greatest meeting on metals ever held.

Technical sessions of the American Society for Steel Treating, the American Welding Society and the iron and steel divisions of the American Institute of Mining and Metallurgical Engineers and the American Society of Mechanical Engineers are in full swing and very well attended. Nearly 100 papers are scheduled for the sessions.

The exposition occupies 60,000 sq. ft. in the annex and 20,000 sq. ft. in the main part of the public auditorium. Unusual attractiveness is a feature of the displays. Prominence is given to exhibitions of rustless iron, tungsten - carbide tools and nitriding. A large number of metallurgists from abroad are present, including Dr. Adolph Fry, Krupp Laboratories, Essen, Germany; P. F. M. Aubert, of Duval & Aubert, Paris; Otto Piteasen, president German Iron and Steel Institute; Dr. E. H. Schulz, director of the research institute of the United Steel Works Corporation, Germany; Dr. F. Koerber, director, Kaiser Wilhelm Institute, Germany; Cesare Pavone, Milan, Italy; Fernand Turretini, director - general, Société Genevoise D'Instruments de Physique, Geneva, Switzerland, and C. K. Everitt, managing director and works manager, Edgar Allen & Co., Ltd., Sheffield, England. There are also one or two prominent Japanese expected. Some of the foreign visitors are on their way to the world engineering conference in Japan.

The semi-annual meeting of the American Society for Steel Treating will be held under the auspices of the New York chapter in New York, in February, the Friday and Saturday preceding the annual February meeting of the American Institute of Mining and Metallurgical Engineers. Chicago has been selected as the place for the next national metal congress, the week of Sept. 22, 1930. The congress and exposition will be at the Stevens Hotel.

New officers for the calendar year 1930 were nominated yesterday as follows: President, Robert G. Guthrie, Peoples Gas, Light & Coke Co., Chicago; vice-president, J. M. Watson, metallurgist, Hupp Motor Co., Detroit; treasurer, O. A. Fulton, Wheelock, Lovejoy & Co., Boston; directors, W. B. Coleman, W. B. Coleman Co., Philadelphia, and Roy O. E. Harder, University of Minnesota.

Dr. Albert Sauveur, Harvard University, will deliver the annual Campbell memorial lecture tomorrow morning. President Wickenden, the new head of Case School of Applied Science, Cleveland, will be the chief speaker at the banquet Thursday evening. At the joint dinner tonight of the Institute of Metals and iron and steel division of the Mining Engineers the speakers are Floyd T. Taylor, vice-president, Hanson Van Winkle, Munning Co., and Dr. H. W. Gillett, director Battelle Memorial Institute, Columbus, Ohio.

Wide interest was aroused by statement in the local papers this morning credited to G. M. Eaton, metallurgist, Molybdenum Corporation of America, Pittsburgh, that manganese-molybdenum steel is the alloy for future rails and the solution of some present track problems. A session on steel metallurgy this morning, attended by about 500, was presided over by Radcliffe Furness, Midvale Steel Co., Philadelphia, and by Dr. C. H. Herty, Jr., Pittsburgh. Some excellent papers on steel castings, on slags in open-hearth and electric furnace practice, on electric furnace steels and on locomotive forgings were presented and discussed. A report of this session will appear in THE IRON AGE Sept. 19.

Registration to date is very large for all societies, and a large majority of the prominent metallurgists from the United States is present, as well as from Canada and abroad.

To Hold Production Meeting in Cleveland

The annual national production meeting of the Society of Automotive Engineers, Inc., will be held at Cleveland, Oct. 2 and 3, in cooperation with the National Machine Tool Congress and the American Society of Mechanical Engineers. The sessions will be held in the evening and are under the general charge of E. P. Blanchard, Bullard Co., Bridgeport, Conn., who is chairman of the S. A. E. production committee.

Prof. F. E. Raymond, Massachusetts Institute of Technology, will present a paper on "Economic Production Quantities" on Wednesday evening, Oct. 2. It is anticipated that Professor Raymond's paper will be a presentation of the results of a survey he has recently completed by personal visits to a large number of the more important automobile manufacturing plants.

The Thursday evening session will be in the nature of a forum of production executives and production engineers for discussion of the following four subjects:

1. Application of standard machine tools to automobile manufacture.

2. Results in production due to new features of machine tool construction.

3. Synchronizing automobile parts at the assembling line.

4. Basis of replacing machine equipment.

On Friday evening the Cleveland sections of the Society of Automotive Engineers and the American Society of Mechanical Engineers will act jointly as hosts for the annual production dinner at the Hotel Cleveland.

Makes Tanks to Hold Helium Gas

A battery of 96 storage tanks, having a total capacity of 1,000,000 cu. ft. of helium gas, is to be furnished the Goodyear Zeppelin Corporation, Akron, Ohio, by the A. O. Smith Corporation, Milwaukee. Each tank will be 80 ft. long and 2 ft. in diameter. Two lengths of Smithweld gas line pipe are to be joined and heads welded to the ends to form each tank. The tanks will be buried under ground and suitably manifolded in groups. A similar contract, calling for 50 tanks, for installation at the Lakehurst, N. J., field, has been awarded to the A. O. Smith Corporation by the United States Navy Department.

Iron and Steel Markets

Railroad Demand Sets In

Fall Rail Buying Gets Under Way and Equipment Orders Impend, But Steel Output Declines—Heavy Steel Scrap Off 50c. at Pittsburgh

EVIDENCES of a revival in railroad buying, a slight gain in the requirements of the automotive industry and prospects for a recovery in farm machinery output are favorable straws in a steel market that is still without a well defined trend.

These developments have come too late to prevent a further decline in steel works output, but they at least indicate that the low point in demand may have been passed.

Following the placing of 30,000 tons of rails by the Reading, 75,000 tons of new inquiry has appeared, including 54,000 tons for the Chesapeake & Ohio, and fully 400,000 tons is expected to come into the market before the end of the month.

The railroad equipment outlook is also beginning to show more promise. Although buying for the week was limited to 1000 gondola cars for the St. Paul, requiring 15,000 tons of steel, new inquiries include 2000 hopper cars for the Norfolk & Western and 500 gondola car bodies for the Chicago & Easern Illinois.

While a betterment in steel demand from these and other sources is clearly in prospect, the extent of the increase cannot yet be estimated. Meanwhile mill backlogs have continued to shrink and extended deliveries have become a thing of the past.

With no incentive for forward buying, there is no rush on the part of steel consumers to place fourth quarter contracts. Although mills have actually opened their books at unchanged prices or have indicated a willingness, in many cases, to extend present quotations into the next quarter, their customers prefer to await developments. Both sellers and buyers are apparently fencing for advantage pending a test of the market.

The decline of 429,966 tons in the unfilled orders of the Steel Corporation in August was not unexpected in view of unusually large production and the steady falling off in forward commitments. While total unfilled business on Aug. 31, at 3,658,211 tons, was only 34,000 tons larger than a year previous, output for the month was much heavier than in 1928. Steel ingot output for all producers in August totaled 4,925,802 tons, or nearly 750,000 tons more than in the corresponding month one year ago, and in terms of daily average was less than 7 per cent short of the all-time record of last May.

With business back on a hand-to-mouth basis, production can still be large, as has been amply proved in recent years. For the current week steel ingot output ranges from 85 to 95 per cent, with some of the smaller mills running at as low as 80 per cent. Virtually all producers except the leading independent, which expects to maintain a 95 per cent operation through September, have curtailed output. The average for Steel Corporation subsidiaries is estimated at 91 per cent of capacity. Among the producing centers, the Chicago district has shown the sharpest drop, with operations now at 92 per cent compared with close to a capacity rate a week ago. Pittsburgh and Buffalo plants are running at 90 per cent.

Pig iron users, like steel buyers, are conservative in their purchases, although many of them have covered for at least a substantial part of their fourth quarter needs. The threat of Southern competition has not disappeared, and offerings of steel company iron may become more of a market factor if ingot production continues to decline.

Scrap is dull or definitely weaker in most centers, reflecting the uncertainty of steel company operations. Heavy melting steel at Pittsburgh has declined for the second week to $18.25 a ton.

A recession in plate demand at Chicago is the result of a temporary suspension of pipe line work at Milwaukee. The Wisconsin fabricator, however, has just booked 106 miles of 16-in. pipe (15,000 tons) for utilities operating in Nebraska and Oklahoma. Contracts for two pipe lines at Vancouver, British Columbia, and another at Bremerton, Wash., call for 8000 tons of plates.

Structural steel lettings, at 44,000 tons, showed a substantial gain over the previous week. Fresh inquiries call for 26,000 tons, including 9300 tons for a New York subway section.

Bars, plates and shapes at Birmingham have been reduced $2 a ton to 2.10c. a lb., cutting the differential over the Pittsburgh base from $5 to $3 a ton. Galvanized sheets at Birmingham have been marked down from 3.75c. to 3.70c. In other districts quotations announced show no change except on galvanized sheets and cold-rolled strip, on which some mills are asking an advance of $2 a ton over recent minimum prices.

Copper sales last week, at 100,000 tons, were the largest on record, with bookings about evenly divided between foreign and domestic users. The leading producer has abandoned its efforts to advance prices, which are firm at 18c., delivered Connecticut Valley, for electrolytic metal.

THE IRON AGE composite prices are unchanged at $18.25 for pig iron and 2.398c. a lb. for finished steel.

Pittsburgh

Ingot Output Above 90 Per Cent, But Orders Are Needed—Scrap Declines 50c. a Ton

PITTSBURGH, Sept. 10.—Following a slight dip last week brought about by the holiday and the extremely hot weather, steel ingot production in this district is again above 90 per cent of capacity, with the Steel Corporation subsidiaries closer to 95 per cent. Youngstown district companies are at a slightly lower rate, while plants down the Ohio River have not curtailed their steel output. In many cases, however, operations are rapidly approaching a hand-to-mouth basis and nearly all of the large independent companies are badly in need of tonnage for their finishing mills.

Reserve supplies of semi-finished steel have again reached normal levels and immediate deliveries may be had on this material as well as on all finished products, with the exception of sheets. In the face of declining demand, buyers are again taking an interest in prices, and with fourth quarter figures yet to be officially announced on leading products, steel makers are making strong efforts to hold present quotations for the final three months of the year. Thus far they have apparently been successful. No pronounced weakness has developed in the last week.

Independent makers of sheets have refused to make fourth quarter contracts at less than 2.85c. on black and 3.60c. on galvanized. In the East, concessions of $1 a ton are occasionally reported on bars, but the price is holding in the natural Pittsburgh territory. Nail prices are still soft at points down the Ohio River, but the $2.55 minimum is holding in this district. The $35 quotation on billets and slabs has not yet been tested on fourth quarter business.

Prospects for heavier buying of steel next month have not improved. Schedules of the Ford Motor Co. for October call for an operation of only five days a week, as compared with six days in the last few months, and its steel requirements will be correspondingly reduced. The other large maker of low-priced cars is expected to take less steel than it is taking this month. Declines from these sources will hardly be offset by increased production of cars in the medium-priced field.

Heavier demand from other large steel consuming industries is still a matter of conjecture. Under such circumstances, sentiment in the steel market no longer carries the optimism of a month ago. While there is no expectation of any pronounced falling off in business this fall, there is a growing belief that a gradual tapering off may continue well into the last quarter of the year.

Reflecting the uncertainty of steel plant operations, the scrap market is definitely weaker. Heavy melting steel is off 50c. a ton, with buying by mills at a standstill and dealers extremely eager to obtain orders. Other grades of scrap are correspondingly soft.

Pig Iron.—Fourth quarter buying has not begun to develop to any large extent, but a fair volume of small orders is coming to local furnace agents, and the aggregate sold during the last week was the highest in some time. Large inquiries seem to be few, although a radiator manufacturer at Uniontown, Pa., is inquiring for 4400

tons of No. 2 plain, and 900 tons of No. 2 X. Other sizable inquiries, if they exist, are not general. In the Valleys, prices are reported to be holding at $18.50, furnace, for basic and foundry iron and at $19 for malleable and Bessemer. Recent sales in that territory have fully justified these quotations, but there is question as to the strength of Pittsburgh delivered prices. A recent transaction in this market is said to have brought out a lower figure than the Neville furnace base plus the freight rate to the point of delivery. The position of merchant furnaces is rather favorable, as stocks are low and order books still are large in some instances. Steel company iron has not become a factor in the market, although there are reports that tonnages will soon be offered if ingot production in the district is curtailed much further.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Buyers of crude steel are not yet showing any interest in their fourth quarter needs, as they are at present very much in doubt as to how large these will be. They have plenty of steel on hand, as in many cases production of finished products was curtailed more rapidly during the last month than shipments of billets and slabs. Sellers are at present taking a firmer price stand on spot shipments and say that the price for the closing months of the year on contract tonnage will be at $35 for billets, slabs and sheet bars, and $40 for forging billets. These prices, representing as they do an advance over the first half of the year, on billets and slabs, are not satisfactory to consumers who are getting no more for their finished products. Under the circumstances, the price situation bears elements of uncertainty. Wire rods are not moving as actively as they were in the summer, but there is still a fair demand and apparently no question about the $42, Pittsburgh or Cleveland, quotation.

Bars, Plates and Shapes.—Deliveries on the heavy hot-rolled products are still improving, and the tight situation in plates, which has existed for several months, is beginning to ease. Pittsburgh mills are no longer receiving plate tonnage from the Chicago district, and, although the demand of local consumers has not been curtailed much, production is fully equal to the present demand. Structural awards in this district have been rather light for several weeks, and backlogs of fabricating shops are gradually dwindling. Only the larger interests are able to see ahead more than a month, and a few of the smaller units are quite anxious for business. Barge shop operations are still high, but in another six or eight weeks present commitments will be about worked off, with a consequent diminishing demand for steel. Merchant bars are quiet and business is now largely on a hand-to-mouth basis. There is more activity in reinforcing bars, although makers are now able to divert tonnage to this use which ordinarily went to other departments and are gradually improving deliveries. Fourth quarter prices have not been announced, but it is generally expected that there will be no change from the present quotation of 1.95c., Pittsburgh, on bars, plates and shapes.

Rails and Track Accessories.—This is ordinarily one of the dull periods of the year. Considering this, specifications are coming in at a satisfactory rate and shipments are holding up fairly well. The Reading Railroad has placed 30,000 tons of rails, of which 24,000 tons went to the Bethlehem Steel Co. and 6000 tons to the local mill. Rail inquiries have not yet begun to appear, but a number of roads are said to be preparing their requirements and are expected to come into the market earlier than usual.

Wire Products.—Local producers of wire have not yet definitely determined fourth quarter quotations, and the present instability in prices has apparently held up buying in many cases. Shipments of manufacturing wire are sustained, and there has been no marked curtailment in specifications. Jobber business is very quiet in both wire and nails. Present quotations range from $2.55 to $2.65 a keg on nails and 2.40c. to 2.50c. base a lb. on wire.

Tubular Goods.—The pipe market is rather dull from a standpoint of unusual developments, although business in both lap-welded and seamless tubing is coming in at a steady rate, and mill operations are comparatively high. On butt-weld pipe demand is quiet, and local makers can see no signs of definite improvement in the near future. Production of mechanical tubing has been curtailed on account of the reduced requirements of the automobile industry, but improved demand is expected within a month.

Sheets.—Sheet manufacturers have not officially opened their books for fourth quarter, but most of them have assumed a willingness to take business at present maximum quotations. The 2.85c., Pittsburgh, price on black sheets has been fairly well established for several weeks, but a quotation of 3.60c. on galvanized sheets will represent an advance to some consumers who have been able to buy during the present quarter at 3.50c. On light plates, blue annealed, the fourth quarter quotation will be 2.20c., Pittsburgh, for the No. 10 gage, while blue annealel sheets, No. 13 gage, will be unchanged at 2.35c. Local makers have maintained these quotations rather firmly during the present quarter, although concessions of $2 a ton have been reported from other districts. A few large users have recently been able to buy automobile body sheets at as low as 4c., Pittsburgh, but this concession represents the usual preferential offered to very large buyers and does not represent any marked weakness. Quotations of less than 3c., Pittsburgh, on tin mill black plate have never been admitted as representative of the market by some makers, and this price will be quoted on fourth quarter busi-

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
Chromium Nickel Vanadium		1.50
Carbon Vanadium		0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is 3/16c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, 5/16 in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43¼	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased 7½ to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1⅞ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2⅞ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1⅝ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

ness. Specifications on sheets are somewhat lighter and deliveries on nearly all the common finishes, except occasionally blue annealed, can be had in three to four weeks. Backlogs are still declining, although hot weather seriously curtailed operations last week. For the present week the leading interest has scheduled its mills at just under 100 per cent of capacity.

Tin Plate.—Operations of all the leading independent companies have fallen under 75 per cent and some are closer to 50 per cent. The largest producer, however, plans to run its mills at better than 85 per cent this week. This figure includes the Chicago district, where curtailment has not been as marked as around here. During the corresponding dull period in other years some companies have been able to roll considerable export tonnage, but this year's exports are smaller than usual on account of the low-priced competition of foreign makers.

Strip Steel.—Demand has shown no further decline since the first of the month, and some makers report a beginning improvement in the specifications of automobile makers. Nevertheless any important increase in demand from this source before October would be a surprise to local mills which expect a quiet month. Strip mill operations are not higher than 75 per cent of capacity in this and nearby districts. Prices seem to be holding and makers are anxious to maintain present schedules on fourth quarter contract tonnage.

Cold-Finished Steel Bars.—No new activity has developed in this market, but business has shown little decline from recent levels and conditions are generally satisfactory. Makers are beginning to make fourth quarter contracts at unchanged prices, although the new extras announced last July will apply on this business.

Cotton Ties.—Buying of cotton ties has been practically concluded for the season, and total tonnage to be shipped will be approximately the same as last year. However, Pittsburgh mills took a comparatively smaller tonnage, the bulk of the business having gone to makers at Atlanta, Ga., and Birmingham and to foreign producers. The price this year was established by the importers at $1.05 per 45-lb. bundle, f.o.b. Gulf ports. Southern and Pittsburgh mills met this figure on most of the business. In future, Pittsburgh district producers expect to reduce their tonnage still further as they cannot compete profitably with the Southern or imported product at present price levels.

Old Material.—The scrap market has taken a definitely weaker turn and prices have declined at least 50c. a ton on all the principal grades. The Pennsylvania Railroad list, which was sold last week, is said to have brought figures ranging from $18.75 to slightly over $19 for steel scrap, while the Baltimore & Ohio list, which closed yesterday, did not bring more than $18.75. As heavy melting steel is offered freely at $18.50 and less, and may be picked up by local dealers at $18, the market is now quotable at $18 to $18.75, with an average tending toward the lower figure. In the absence of mill buying, it is difficult to quote the market with any certainty, although eagerness to sell on the part of the dealers is undoubtedly responsible for the weakness which has become accentuated in the last two days. Hydraulic compressed sheets are nominally quoted at $18 to $18.50, a decline of 25c. from recent levels, and lighter steel works grades, such as short shoveling steel turnings and machine shop turnings, are off 50c. and 75c.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.00 to $18.75
No. 2 heavy melting steel	16.00 to 16.50
Scrap rails	17.50 to 18.00
Compressed sheet steel	18.00 to 18.50
Bundled sheets, sides and ends	16.50 to 17.00
Cast iron carwheels	16.50 to 17.00
Sheet bar crops, ordinary	19.50 to 20.00
Heavy breakable cast	12.50 to 13.00
No. 2 railroad wrought	18.00 to 18.50
Hvy. steel axle turnings	16.50 to 17.00
Machine shop turnings	11.75 to 12.25
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.50 to 22.00
Railr. coil and leaf springs	21.50 to 22.00
Rolled steel wheels	21.50 to 22.00
Low phos. billet and bloom ends	22.00 to 22.50
Low phos., mill plates	22.00 to 22.50
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	20.50 to 21.50
Heavy steel axle turnings	16.50 to 17.00
Electric Furnace Grades:	
Low phos., punchings	20.00 to 21.00
Hvy. steel axle turnings	16.50 to 17.00
Blast Furnace Grades:	
Short shoveling steel turnings	12.50 to 13.00
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Warehouse Business. — Sales of many products have shown a slight improvement since Labor Day, and further increase in volume of business is expected this month. Prices on sheets and wire products are rather soft, reflecting weakness in mill quotations, but many distributers are still quoting recent maximum prices on the usual run of business. Bolt and nut prices are firm and demand is fair. Sales of roofing are improving.

Coal and Coke.—Weakness in the furnace coke market is gradually being corrected by curtailment of production, more than 500 ovens having been put out in the Connellsville district last week. The market is still quotable at $2.65 to $2.75, Connellsville, although the higher figure is being done on very little business and $2.60 has been done on some occasions. Foundry coke prices are also weak, but there are occasional reports of improved demand. The premium brands are holding at $4.85, ovens. Fall demand for coal is increasing, but the market has shown little price strength.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.

Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	2.90 to 3.00
Cement coated nails, per keg	3.05

Wire Mesh Prices Reduced Sharply

On Sept. 5 the John M. Hart Co., 435 Lexington Avenue, New York, distributer of Hanover wire cloth, announced new opening prices for the season of 1930 on copper and bronze mesh. The new prices are not only reductions from the former f.o.b. mill quotations, but include freight allowances on carload lots to all points on and east of the Mississippi River, including Duluth, St. Louis and New Orleans.

On less than carload lots the new prices include a freight allowance not exceeding 80c. per 100 lb. from Hanover, Pa. On shipments to consumers west of the Mississippi River the freight allowance in the new prices on both carload and less than carload lots is $1.07 per 100 lb., which is the carload freight rate from Hanover, Pa., to St. Louis. As about 75 per cent of the business in copper and bronze wire screen cloth is in the freight allowance territory, the new basis of quoting represents a considerable reduction to consumers.

The terms are net payment in 60 days, or 2 per cent discount for cash in 10 days, with all business dated March 1, 1930. Where prepayment is made the prepayment discount is 6 per cent per annum.

The new prices, which include freight allowance, are on copper mesh, $5 per 100 sq. ft. for No. 14, $5.40 per 100 sq. ft. for No. 16 and $5.65 per 100 sq. ft. for No. 18.

On bronze mesh the quotations are $5.35 per 100 sq. ft. for No. 14, $5.70 for No. 16 and $6 for No. 18. An allowance of 5c. per 100 sq. ft. is given on large rolls of about 300 lin. ft. and 7c. per 100 sq. ft. is allowed on cloth which is not boxed.

A two-year research program in lubrication is planned by a special research committee on lubrication of the American Society of Mechanical Engineers. It calls for an expenditure of $20,000.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and under 10 in., Pittsburgh	$35.00
Rerolling, 4-in. and under 10 in., Youngstown	35.00

Chicago

Railroads Feature Week's Business—Ingot Capacity at 92 Per Cent—Light Manufacturing Continues Active

CHICAGO, Sept. 10.—The feature of this market is the activity shown by railroads. The St. Paul has ordered 1000 70-ft. gondola cars from two Western builders, who soon will place the 15,000 tons of steel needed. Inquiry for rails, which is out fully three weeks earlier than usual, totals 75,000 tons, and fresh requests are taking shape that may double the amount in the next week or ten days.

Inflow of railroad business has not come early enough to check shrinking backlogs and halt a revision downward in steel mill operations. The leading producer has taken out No. 9 furnace at South Works for relining, and No. 4 stack at Gary has been banked for needed repairs, which will require about two weeks' time. This means a loss of two steel works furnaces in the week, bringing the total count of active stacks to 27 out of 36.

With curtailment of pig iron production makers of steel have been forced to cut ingot capacity, the average in this district now being 92 per cent.

Glancing over the situation as a whole, it is found that light manufacturing of a general character is still very active. Some improvement is noted in demand from automobile and parts makers. Agricultural machinery builders find no encouragement in larger orders, but they are planning heavier production schedules to go into effect this fall. Road machinery manufacturers are cutting output and still further revision downward seems at hand. Temporary suspension of several line pipe contracts has eased the immediate demand for plates, because the maker of this commodity is not desirous of putting steel on the ground.

Prices for most steel mill products are well established at present levels and there seems to be little thought given by buyers to changes for the fourth quarter. Sellers of heavy tonnage products have not announced prices for the final period. Although no formal announcement has been made regarding future prices for wire and wire products, it is known that some contracts for delivery after Oct. 1 have already been signed.

Ferroalloys.—From the viewpoint of shipments, this market is active but sales are small.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Sheets.—Announcement of fourth quarter prices has started a buying movement. Demand for roofing sheets is heavy. Output in this district ranges from 85 to 90 per cent.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Pig Iron.—With the bulk of fourth-quarter needs covered, foundries in this district continue buying at a uniform rate. Prices for Northern iron remain firmly fixed at $20 a ton, f.o.b. local furnace, and there seems no anxiety among buyers that this level will be changed. Delays have set ahead the relighting of the third Iroquois furnace. In the meantime five merchant stacks are producing. This week has seen the closing of several old Southern iron quotations at $13 a ton, Birmingham. There is a general feeling that Southern iron interests' bid for business in this district has spent its force and announcements are to the effect that prices are to be pegged at $13.50 to $14.50 a ton, Birmingham. Two cargoes of Lake Erie iron arrived at Chicago docks late last week.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$18.51 to 19.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Rails and Track Supplies.—Buying of heavy-section rails for fall rolling has got under way fully three weeks earlier than usual. The Chesapeake & Ohio will buy 56,000 tons of rails and 14,000 tons of track fastenings. Other needs by Western railroads bring total pending inquiry to not less than 75,000 tons. Inquiry that is expected to come before the trade in a few days totals 100,000 tons. Local sellers estimate that fully 400,000 tons will have been asked for by the end of this month. Last year more than half of the Chesapeake & Ohio order was placed with Western mills. The Colorado rail mills, which have been down since early in August, are expected to resume operations before the end of this month. One Chicago rail mill has about two weeks' work ahead, whereas another producer continues to operate at 75 per cent and will hold to this rate until order books have grown. Orders for light rails are of car lot size. An inquiry is out for a round tonnage of iron tie plates to be delivered in the spring.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—This market remains spotty, with little to indicate that improvement is near at hand. For the most part, public utilities have specified in full against spring delivery orders and it will be several months before they make known their 1930 needs. Railroads are taking a larger aggregate tonnage, but individual orders are of car lot size. Other small users, including industrials, are more active in taking minor tonnages. Northfield, Ill., has ordered 3000 tons of cast iron pipe through a contractor. James B. Clow & Sons have taken 1000 tons of 20 and 24-in. pipe for Columbus, Ohio, and the Lynchburg Foundry Co. has been awarded 2500 tons of 36-in. pipe by Detroit. The McWane Cast Iron Pipe Co. will furnish 15,000 ft. of 4 and 8-in. pipe for Franklin, Ohio, and 15,000 ft. of 6-in. pipe for Newark, Ohio. Chaffee, Mo., is in the market for 22,000 ft. of 4-in.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Structural Material.—The local building situation is at low ebb, and competition is unusually severe on going jobs. Although bids have been entered on a number of heavy tonnage projects, these move slowly. Small tonnage projects, which are numerous, are being eagerly sought after by many fabricators, with the result that small shops, to which this class of work usually goes, are having trouble in holding organizations together. Several medium-sized shops have only a few weeks of work on their books. Some of the large shops are eating heavily into backlogs, while others with substantial books are having difficulty in meeting delivery promises. The Phillips High School, Chicago, which will take 3700 tons, will be delayed because bids have been thrown out and new figures must be taken. Deliveries are still further improved, with two to three weeks being promised on heavy shapes and three to four weeks on light sections. Structural shapes, shipped by boat to Chicago, can be had in two to three weeks. This is the first time in many months that a Chicago producer can match delivery dates with water shipments of steel. Sellers have not announced fourth quarter prices, but it is generally believed in the trade that quotations will be unchanged from those of this quarter.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Reinforcing Bars.—Marked increase in general activity in this market is shown as the vacation season comes to a close. New contracts total over 1000 tons and fresh inquiry exceeds this figure. It is interesting to note, however, in contrast with a year ago, that the bulk of current business is for schools, industrial buildings and institutions, whereas last year apartment buildings were most prominent. Highway departments in Illinois and neighboring States are busy with new plans, and the trade is looking in that direction for a substantial volume of business. Efforts to clarify the price situation have so far been fruitless. Billet steel reinforcing bars in attrac-

tive tonnages are commonly priced at 2.10c. a lb. and similar business in rail steel bars is at 1.95c. a lb.

Plates.—The stress for deliveries of plates in this district is at least momentarily relieved, following the holding up of several pipe line contracts with resultant lighter tonnages of plates needed by pipe makers. The temporary suspension of this work, together with a general slackening in the market as a whole, has resulted in improvement in delivery dates to the range of three to four weeks in the case of local producers, while steel makers on Lake Erie will promise deliveries by boat at Chicago in two to three weeks. A Southwestern oil refiner has ordered 1000 tons of plates for tank construction, and 3000 tons will be needed for similar work in Texas. Total inquiry for large tank programs is for not less than 16,000 tons of plates. The Chicago & Eastern Illinois denies a report that it has ordered 500 cars from a Western builder. It has, however, before the trade an inquiry for 500 steel gondola car bodies, but at this time there is no assurance that a contract will be placed, as the road may build these bodies in its own shops. An order for 50 refrigerator cars has been taken by the Pullman Car & Mfg. Corporation. Car builders continue to view the outlook with anxiety. Old contracts are running out and, even if shop schedules are curtailed, it may be difficult to hold organizations together until new orders, if placed, can be started on. The argument is being advanced to railroads that the cost of cars will be favorably reflected in quotations if building programs can go forward with only slight interruption.

Bars.—The slackening demand for mild steel bars is resulting in improvement in deliveries. Some sizes can now be had promptly, while the average, taking into consideration all sizes, is now not over four weeks. New sales are in small volume in the absence of announcements of fourth quarter prices. Specifications lag behind shipments. Demand from the agricultural machinery manufacturers continues to taper, though there are indications that production will swing upward in the early weeks of October. One tractor plant has little domestic business on hand, operations being sustained by sizable orders from Russia. Road machinery builders are experiencing the first period of slackening operations in many months. Automobile parts manufacturers are taking larger quantities of steel, and this is viewed by the trade as an omen that the industry as a whole will soon reach higher levels of output. Use of alloy steel bars by the automobile trade is fully one-third above the low point of mid-August. Production schedules are being revised upward, and deliveries on many sizes are no longer prompt. Books have been opened for fourth quarter at unchanged prices. New buying is in fair volume and inquiry is brisk. Fourth quarter prices for iron bars are being named at 2.05c. a lb., Chicago. Several railroads have inquired for their fourth quarter needs. Little interest is being shown by buyers in fourth quarter tonnages of rail steel bars, prices of which are unchanged at 1.95c. a lb., Chicago Heights mill.

Wire Products.—Producers have opened fourth quarter books at current quotations. Inquiry from the manufacturing trade is brisk and several contracts for the final three months have been closed. The jobbing trade, on the other hand, is reluctant to make forward commitments and continues to take needs on a hand-to-mouth basis. Demand for woven wire fencing is forging ahead slowly, with the railroads taking normal quantities for this time of the year. There is no snap to the country trade, and the outlook for improvement is less favorable now than it was a week ago. The cause of this situation is drought, which is affecting many parts of the country. Nail demand is light and prices are still unsettled. It is not uncommon here to find common wire nails quoted at $2.50, base, a keg.

Bolts, Nuts and Rivets.—Last quarter contracting is progressing steadily and prices remain steady. Demand is lighter than at midsummer, due in large measure to smaller output by makers of agricultural machinery.

Coke. — Shipments of by-product foundry coke are moving forward at local oven capacity. Prices are well fixed at $8 a net ton, local furnace.

Old Material.—The Chicago scrap market is marking time. A small tonnage of heavy melting steel has been taken by a user at $16 a gross ton, delivered, and several carloads of cast iron borings have commanded a price of $11.25 a ton, delivered. On the whole, large users are holding out of the market against pressure by sellers. One steel mill has made a sharp cut in shipments of heavy melting steel. Prices for hydraulic bundles are soft. Mills are closely differentiating between dealers' bundles and those prepared by factories. The former will not bring over $13.50 a ton in the present market. A large user of mallable scrap is expected to come into the market this week, and brokers are talking of an advance of 50c. a ton. Users of low phosphorus and electric furnace grades are insistent takers of scrap.

Prices deliv'd Chicago district consumers:

	Per Gross Ton
Basic Open-Hearth Grades:	
Heavy melting steel	$15.25 to $15.75
Shoveling steel	15.25 to 15.75
Frogs, switches and guards, cut apart, and misc. rails	16.75 to 17.25
Hydraul. compressed sheets	13.75 to 14.25
Drop forge flashings	10.75 to 11.25
No. 1 busheling	13.25 to 13.75
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	17.00 to 17.50
Low phos. plates, 12 in. and under	17.00 to 17.50
Blast Furnace Grades:	
Axle turnings	13.00 to 13.50
Cast iron borings	10.50 to 11.00
Short shoveling turnings	10.50 to 11.00
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	18.00 to 18.50
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	20.00 to 20.50
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
	Per Net Ton
Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.50 to 22.00
Iron car axles	26.50 to 27.00
Steel car axles	17.50 to 18.00
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.75 to 14.25
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

Cement c't'd nails, base per keg	3.20

Lower Rail-Water Rates from East Suspended

WASHINGTON, Sept. 10.—The Interstate Commerce Commission has suspended until Sept. 5 tariffs proposing reductions of 7.5c. a 100 lb. on iron and steel products in carloads over rail-ocean-rail routes from Atlantic seaboard territory to destinations in Texas. A hearing will be held on Sept. 30 at the Sherman Hotel, Chicago, before Examiner Ketler. Illustrative of the schedule are proposed rates of 73.5c. and 75c. a 100 lb. to Dallas from Reading, Pa., Bethlehem, Pa., respectively, the present rates being 81c. and 82.5c.

New York

Pig Iron Situation Highly Competitive—September Steel Demand Shows No Upward Tendency

NEW YORK, Sept. 10.—With Southern pig iron still setting the pace, the price situation in this district remains highly competitive. Alabama foundry iron continues to be quoted at $12.50, base Birmingham, which means delivered prices on water shipments of $19.50 a ton or less at nearby New Jersey points. Eastern Pennsylvania producers have gone as low as $18.50, furnace, to meet this competition. Other Northern furnaces have been able to quote favorable delivered quotations on barge shipments, although they have failed to meet competitive prices in a number of recent transactions. The barge rate from Buffalo is about $2 a ton and the transfer charge to railroad cars at New Jersey ports is 15c. a ton. Buffalo producers are not so aggressive as some time ago, and in many cases will not quote below $17.50 a ton, furnace, for all-rail delivery. Sales in this district during the week were of fair proportions, totaling 12,000 tons. The Bridgeport, Conn., consumer which was in the market for 10,000 tons of basic has bought several thousand tons of Northern iron and to date has not ordered any Alabama material. The low manganese and high phosphorus content of Southern iron is objectionable to many melters in this district, with the result that they are frequently willing to pay a premium of 50c. a ton or more to obtain Northern metal. Pending inquiries total 4000 tons, of which the largest is 2000 tons of foundry for fourth quarter shipment. Most buyers have bought conservatively for the last quarter, but will undoubtedly make supplementary purchases if business remains as active as at present.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Cast Iron Pipe.—Some makers believe that recent dry weather may result in buying of pipe by certain municipalities which have been obtaining part of their water from private companies. Buying in the past week has been confined to small orders from private users. Prices are substantially unchanged. About 2000 tons of water pipe included in contractors' bids to the Department of Water Supply, Gas and Electricity, New York, has been awarded by the contractor to the United States Pipe & Foundry Co. About 200 tons of 6-in., Class C, water pipe will be required in a contract at Tarrytown, N. Y. The American Construction & Securities Co., New York, is inquiring for 800 tons of 12-in. and smaller pipe for export to Havana, Cuba.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Warehouse Business.—Buying from stock has improved. Black sheets are still being shaded about $1 a ton, and concessions on galvanized sheets range from $1 to $3 a ton. Blue annealed sheets, which are being sold by jobbers in this district on the former base of No. 10 gage for all sizes, are shaded from $3 to $5 a ton.

Reinforcing Bars.—The Truscon Steel Co. will furnish 1500 tons of bars for a warehouse of the Pennsylvania Railroad in Jersey City. Bids are now being taken on 300 tons of bars for section 9, route 101, of the New York subway. The State of New Jersey is expected to award 300 tons shortly for bridge work. The volume of small orders ranging from 25 to 75 tons has been fairly good. Prices are unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—Local sales offices of steel companies are unable to detect an upward trend in the volume of orders and specifications since Sept. 1. Available figures, however, indicate that there has been no further decline, present orders holding at about the rate of the latter half of August. Here and there some sign of improvement has been noticed, but it has not been of sufficient importance to mark any general tendency. Insofar as the outlook for the remainder of the year may be gaged, the willingness of steel consumers to make fourth quarter contracts is perhaps the most significant development of the past week. No large amount of contracting has been done, but a considerable number of buyers of steel bars and sheets have signed up for the last three months. No change of prices is indicated on any product, with the possible exception of galvanized sheets and cold-rolled strip steel, on which some producers are trying to get $2 a ton above recent minimum quotations. The only new sign of price weakness is in structural shapes, which some Eastern fabricators have been able to buy at delivered prices which figure back to 1.80c., Pittsburgh. This has also meant a concession from Eastern base prices. There is a lull, believed by fabricators to be temporary, in building construction awards, although a vast amount of New York work is in prospect. The outstanding award of the week was 24,000 tons for the new Waldorf-Astoria Hotel, to be erected on Park Avenue, New York. For subway work, an inquiry has been issued for 9300 tons. Railroad equipment buying lags. A pipe line project, involving 191,000 tons of welded pipe, which was tentatively awarded in July to the Milwaukee fabricator has been held up pending the completion of contracts for other equipment required for the project. This line is to be built by the Central States

No. 20	4.30c. to 4.50c.
No. 22	4.40c. to 4.60c.
No. 24	4.65c. to 4.75c.
No. 26	4.90c. to 5.00c.
No. 28*	5.15c. to 5.25c.
No. 30	5.55c. to 5.65c.

*No. 28 and lighter, 36 in. wide, 20c. higher per 100 lb.

Natural Gas Co., in which a number of prominent oil companies are interested. The A. O. Smith Corporation, Milwaukee, has booked 106 miles of 16-in. electrically welded pipe for utilities operating in Nebraska and Oklahoma. Structural steel lettings in the New York metropolitan district during August amounted to 74,566 tons, not including subway work, bridge construction, etc. This compares with 57,659 tons in July and 43,305 tons in August, 1928.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—Operations are being curtailed in the Connellsville district, but standard furnace coke is unchanged at $2.75 to $2.80 a net ton, ovens. Special brands of beehive foundry coke are quoted at $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Brokers with eastern Pennsylvania contracts on No. 1 heavy melting steel are offering $16 a ton, delivered, but mills are fairly well supplied and shipments permitted are small. A consumer at Harrisburg, Pa., has bought heavy breakable cast at $14.50 a ton, delivered, and brokers are offering $14 a ton on this order. Short shoveling turnings are being bought at $12 a ton, delivered eastern Pennsylvania.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.50 to $13.25
Heavy melting steel (yard)	8.00 to 10.00
No. 1 hvy. breakable cast.	10.25 to 11.50
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.75 to 8.00
Short shoveling turnings..	8.00 to 8.50
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles	19.50 to 20.00
Iron car axles	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.25 to 13.75
Cast iron carwheels.....	12.50 to 13.00
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Production of chrome ore in the Nuevitas district of Cuba rose in 1928 to 28,650 gross tons, compared with 16,027 tons in 1927. All of this output is in the hands of American firms and is exported to the United States. The production of chrome ore has been steadily increasing for the past several years.

Atlantic Steel & Pipe Corporation, Stewart Avenue and Meadow Street, Brooklyn, has been formed by a consolidation of the Watkins Structural Steel Co. and Schreer & Poster, Inc.

Cleveland

Present Prices Reestablished on Nearly All Products for Fourth Quarter—Orders Gain Slightly

CLEVELAND, Sept. 10.—With additional price announcements during the week, third quarter quotations have been reestablished by most producers for the fourth quarter on about all products. Several outside mills have reaffirmed the 1.95c., Pittsburgh and Cleveland, price on steel bars and 1.95c., Pittsburgh, on plates and structural shapes. Present prices have been reestablished on cold-finished steel bars and bolts, nuts and rivets. Galvanized sheets are being quoted for the last quarter at 3.60c., Pittsburgh, the more common prevailing price, and tin mill black plate at 3c., Pittsburgh. While a few steel bar contracts have been placed for the coming quarter, consumers are not yet showing much interest in making commitments for that delivery, and mills are making little effort to close contracts.

Specifications for steel bars, plates and structural material were fair during the past week, business in these lines so far this month showing a gain over the corresponding period of August. Sheets and hot and cold-rolled strip steel are quiet.

While the demand for steel from the automotive industry continues rather light, it shows a slight gain and is expected to increase moderately during the next few weeks. With only two or three exceptions, motor car companies have not yet got under production on their new models. The Fisher Body Corporation is expected to place in a few days a round tonnage of automobile body sheets for the last quarter for Chevrolet cars. Most recent purchases by the automotive industry have been limited to October requirements.

Mills in this territory continue to operate at close to capacity.

Steel Bars, Plates and Shapes.—Orders for steel bars show a little improvement over those of August, but deliveries have continued to gain and most mills can make shipments in two weeks. Some mills are still promising three to four weeks' delivery on structural material and four to six weeks on plates. While 1.95c., Cleveland, is the regular quotation on steel bars, 1.90c. is being named in some cases by a local mill. Plates and shapes are firm at 1.95c., Pittsburgh. Structural inquiry is light, but a good volume of business is in prospect, including considerable bridge work for railroad grade eliminations. Detroit has an inquiry out for 2200 tons of sheet steel piling for its water works intake.

Pig Iron.—Producers continue to enter a fair volume of business in foundry and malleable iron for the last quarter. Sales by Cleveland interests during the week were 18,500 tons, this business having been well distributed in various territories. New releases indicate that the automotive industry will take a little more iron this month than last, although most consumers in that field are taking iron on the same shipping schedules as last month. The agricultural implement industry is taking iron in good volume. One manufacturer in this field has purchased 2000 to 3000 tons for its Springfield, Ohio, and Richmond, Ind., plants. Some of the stove and warm air furnace manufacturers are very busy and are taking iron in good quantities, while others are doing only fairly well. The Southern foundry iron market has a firmer tone, and $13.50, Birmingham, appears to be the lowest price quoted in this territory. There is little interest in the price situation respecting Northern iron, as the market is firm at quotations that have prevailed for some time. Cleveland furnaces quote foundry and malleable iron at $18.50, furnace, for outside shipment and at $19 for local delivery. For Michigan delivery both grades are selling at $20.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$19.50 to 20.00
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—While the leading local producer has not yet named prices for the fourth quarter, it is expected that the present $35, Cleveland, Youngstown and Pittsburgh, price will be reaffirmed for that delivery. Specifications fell off the past week, and a local mill, while still operating at 100 per cent capacity, has reduced its commitments to seven days' operations.

Bolts, Nuts and Rivets.—The present discount of 70 per cent has been reaffirmed for the fourth quarter on bolts and nuts. Stove bolts are also unchanged for that delivery. While

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes.....	3.00c.

No. 9 gal. wire, per 100 lb.....	3.35
Com. wire nails, base per keg.....	2.90

*Net base, including boxing and cutting to length.

makers are feeling the effect of the slump in the automotive industry, the demand shows a slight gain over that of the latter part of August. Rivet manufacturers expect to reestablish the present price of $3.10 a 100 lb. for large rivets and 70 and 10 per cent off list for small rivets for the fourth quarter. Formal announcement to that effect probably will be made late in the week.

Iron Ore.—While shipments will not be so heavy this month as during the record-breaking month of August, there will not be a marked slowing down, and the movement is expected to be about 10,000,000 tons. The balance of ore on docks Sept. 1 was 5,110,516 tons, compared with 5,718,482 tons on the same date last year. Receipts at Lake Erie ports up to Sept. 1 were 29,956,346 tons, compared with 21,514,980 tons during the corresponding period last year. Shipments from these docks were 22,395,864 tons, against 15,595,692 tons up to Sept. 1 last year.

Sheets.—Specifications have been very light the past week. Mills need business in automobile body sheets, but most producers are well filled with tonnage for four to six weeks on other grades. Continuous mills can make quite prompt deliveries. Curtailment in production has been slight. Nearly all producers have announced the reestablishment of the present prices of 2.85c., Pittsburgh, for black, 2.35c. for blue annealed and 3.60c. for galvanized for the last quarter. However, one Ohio mill has named 2.95c. for black sheets, which was the price announced for the present quarter, but this did not hold. A leading producer has announced that it will discontinue the $2 a ton differential on galvanized sheets to jobbers. Prices for current orders are being well maintained, although an occasional concession to 3.55c. is being made to consumers on galvanized sheets. There has not been much fourth quarter contracting as yet, although some of the mills have taken fair-sized lots of automobile body sheets for that delivery.

Cold-Finished Steel Bars.—The present price of 2.30c., Pittsburgh, and 2.35c., Cleveland, has been reestablished for the fourth quarter and mills will start shortly to close contracts. Specifications continue light as a result of the slowing down of the automotive industry.

Strip Steel.—Specifications for hot and cold-rolled strip are light, and most of the mills need orders. Some automotive business is in prospect, which will place some of the mills in a better position. Consumers are taking no interest in fourth quarter contracts, although several mills have opened their books for that delivery at the present prices of 1.90c., Pittsburgh, for wide strip and 2c. for narrow and at 2.85c., Cleveland and Pittsburgh, for cold-rolled strip. While no test has been made of the proposed advance in cold strip prices, there are indications that the larger consumers will be given the 2.75c. price that has prevailed in this quarter.

Coke.—Producers have advanced by-product coke for domestic use 25c. a ton to $4.25, Ohio ovens, for nut size and to $4.75 for egg. Dealers are stocking up, and this is causing a brisk demand. Some activity has developed in heating coke, which is quoted at $2.75 to $3, but there is talk of an advance. Ohio by-product foundry coke continues to move fairly well and is quoted at $8.25, ovens. Connellsville foundry coke is unchanged.

Old Material.—The supply of scrap is more plentiful than it has been for some time and the market has a weak tone. Dealers are able to buy car lots of selected No. 1 heavy melting steel for a Cleveland mill at $16.50, or 50c. a ton less than recently. For lighter material for another mill they are still paying $15.50. Prices also show a softening tendency in the Valley district, where $17.50 to $18 is being paid by dealers for selected heavy melting steel scrap. While $10.75 has not disappeared for blast furnace scrap, $10.50 has become more common. Mills are taking scrap in about the same volume as recently but are not buying additional supplies.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.25 to $15.50
No. 2 heavy melting steel	14.75 to 15.00
Compressed sheet steel	15.50 to 16.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.75 to 10.25
Short shoveling turnings	11.75 to 12.25
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.50 to 10.75
Mixed borings and short turnings	10.50 to 10.75
No. 2 busheling	10.50 to 10.75
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft.	18.50 to 19.00
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Steel Mill Operations Lower—Shipments In Excess Of New Orders—Pig Iron Quiet

PHILADELPHIA, Sept. 10.—With most mills shipping steel in excess of new orders, operating rates have shown further recession, but in most cases mills are at 80 per cent or more of capacity. Plate producers are particularly well engaged, but new business is generally in small tonnages. Bar and sheet buying is limited and sellers are awaiting renewed activity in the automotive field and increased railroad buying as factors in maintaining operating rates.

The Reading Railroad has closed for 30,000 tons of 100 and 130-lb. sections, of which 24,000 tons went to the Bethlehem Steel Co. and 6000 tons to the Carnegie Steel Co. The Chesapeake & Ohio Railroad is inquiring for about 54,000 tons of 100 and 130-lb. sections for delivery next year.

Pig Iron.—Foundry iron buying is confined to small lots for early shipment. Sellers are inclined to believe that many consumers will limit their buying to immediate needs for the rest of this year. Southern foundry iron is still being offered to consumers in this district, but sellers are showing slightly more firmness and are not offering the former concessions of $1 and more a ton from $14, base Birmingham. Eastern Pennsylvania furnaces have also adopted a firmer position and buyers are said to have been unable to obtain less than $21, base, although producers have quoted $19 a ton, base, and lower in outside competitive districts. Basic iron is quiet following the purchase of about 500 tons of special analysis for prompt shipment to an eastern Pennsylvania mill at about $20, base furnace. Two large users in this district are expected to inquire for their last quarter basic requirements in the next fortnight.

Bars.—Mills are maintaining a high rate of operation, but in most cases are shipping in excess of new business. Smaller production is expected unless increased buying by the railroads and automobile manufacturers develops early this fall. The price is unchanged at 1.95c., Pittsburgh, or 2.27c. a lb., delivered Philadelphia.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Reinforcing Bars.—Some sizable projects requiring reinforcing bars are pending award, including a Philadelphia warehouse for the Alamar Stores, 800 tons of bars, and a film exchange building for the Stanley Co., 300 tons of bars. Construction of a factory building for the Atwater Kent Mfg. Co., Philadelphia, has been postponed. Competition between billet

steel and rail steel bar sellers continues keen, and distributers are still accepting billet steel bar business at concessions down to 1.95c. a lb., Pittsburgh, or 2.27c., delivered Philadelphia, with no extra for cutting to length. Rail steel bar sellers are quoting 1.95c., Tonawanda, N. Y., or Franklin, Pa., or 2.27c., delivered Philadelphia, with no extra for cutting to length, but when contracts are secured they are usually at a concession. Rail steel bar mills have suggested that unless billet steel bar prices are maintained at a higher level, it will be necessary to reduce their prices several dollars a ton to establish a sufficient differential.

Shapes.—Demand for small shapes is good and most mills are well engaged on sizes 12-in. and smaller, on which there are slight delays in delivery. Prices continue irregular, especially on the larger specifications, ranging from 1.95c., f.o.b. nearest mill to consumer, or 2.01c., Philadelphia, to 2.05c., f.o.b. mill, or 2.11c., delivered Philadelphia.

Plates.—Tonnages being bought at present are small, but the total volume of orders is sizable and mills are able to maintain a high rate of operation, although bookings are not in excess of shipments. Universal plate mills are being operated better, and deliveries extend to a week or more on universal plates. The price is firm at 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Sheets.—With buying by automobile manufacturers still rather limited, most sheet mills are seeking tonnage. Some shading of galvanized sheet prices continues, with quotations from 3.50c. to 3.60c., Pittsburgh, or 3.82c. to 3.92c., delivered Philadelphia. Black sheets are quiet, and the price is fairly stable at 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia. Blue annealed sheets are quoted at 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage and light plates, blue annealed are 2.20c., Pittsburgh, or 2.52c., Philadelphia, for No. 10 gage. Occasionally, when competition from continuous sheets is encountered, some blue annealed sheet sellers have granted concessions of $1 to $2 a ton from these prices.

Imports.—In the week ended Sept. 7, 4048 tons of pig iron arrived at this port, of which 2300 tons was from the United Kingdom and 1748 tons from British India. Ore arrivals consisted of 4791 tons of manganese ore from British West Africa, 2700 tons of chrome ore from Portuguese Africa and 15 tons of tungsten ore from Germany. Steel imports were 28 tons of steel bands, 44 tons of steel bars and 15 tons of structural shapes from Germany, 20 tons of steel bands from France, 9 tons of steel rods from Sweden and 5 tons of steel scrap from the United Kingdom.

Old Material.—Except for the recent purchase by a Coatesville, Pa., mill of upward of 10,000 tons of No. 1 heavy melting steel for shipment by barge and rail from Baltimore, the market is quiet. A consumer at Harrisburg, Pa., has bought heavy breakable cast at $14.50 a ton, delivered, although brokers are in some instances still paying $14.50 a ton to fill old contracts. Machine shop turnings are being shipped to Phoenixville, Pa., and one broker has been paying $12 a ton for short shoveling turnings on this delivery.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00 to 16.50
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.50
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	14.50 to 15.00
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50

Reinforcing Steel

Awards Total 6200 Tons and Inquiries 2500 Tons

REINFORCING steel awards the past week totaled 6200 tons, as against 1700 tons the previous week. Twenty-three hundred tons will be required for a wharf at Oakland, Cal., and 1500 tons for a Pennsylvania Railroad warehouse at Jersey City. Inquiries, amounting to 2500 tons, consisted of miscellaneous jobs ranging from 100 to 300 tons each. Awards follow:

BLOOMFIELD, N. J., 100 tons, addition to lamp works of Westinghouse Electric & Mfg. Co., to Truscon Steel Co.

PENNSYLVANIA RAILROAD, 1500 tons, warehouse at Jersey City, to Truscon Steel Co.

CLEVELAND, 500 tons, work for Cleveland Union Terminals Co., to Bourne-Fuller Co.

CINCINNATI, 650 tons, Christ Hospital, to Pollack Steel Co.

CHICAGO, 450 tons, Wilbur Wright Public School, to Calumet Steel Co.

CHICAGO, 385 tons, Lying-in Hospital, to Inland Steel Co.

CHICAGO, 100 tons, Bethany Hospital, to Olney J. Dean & Co.

CHICAGO, 160 tons, factory addition for Eugene Dietzgen Co., to Inland Steel Co.

METALINE FALLS, WASH., 100 tons, hotel, to Pacific Coast Steel Co.

OAKLAND, CAL., 2300 tons, wharf, to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 300 tons, section 9, route 101, of subway at Sixth Avenue and Forty-first Sttreet.

STATE OF NEW JERSEY, 300 tons, highway bridges.

CLEVELAND, 140 tons, jail-courts building.

CLEVELAND, 150 tons, Cleveland Union Terminals Co.

CINCINNATI, 200 tons, building for Cincinnati & Suburban Bell Telephone Co.

NORTH CHICAGO, 275 tons, Government Hospital, B-W Construction Co., general contractor.

CHICAGO, 285 tons, DuPont Warehouse.

CHICAGO, tonnage not stated, addition to Michael Reese Hospital.

CHICAGO, 255 tons, apartment building, 1530 North State Street.

CHICAGO, 200 tons, apartment building; Levy & Klein, architects.

CHICAGO, 300 tons, Whittier Public School.

Railroad Equipment

St. Paul Places Orders for 1000 Gondola Cars

THE placing of orders for 1000 70-ft. gondola cars by the Chicago, Milwaukee, St. Paul & Pacific featured the railroad equipment market the past week. The Chicago & Eastern Illinois is taking bids on 500 steel gondola car bodies. The Norfolk & Western may buy 2000 hopper cars and is asking for prices on the rebuilding of 1000 steel hopper cars. Details of the past week's business follow:

Norfolk & Western may buy 2000 hopper cars, instead of 1000 mentioned a week ago, and is also asking for bids for rebuilding 1000 steel hopper cars.

Southern Pacific, Texas lines, is in the market for parts for use in rebuilding 380 box cars.

Wabash will build 100 hopper car bodies for its subsidiary, the Ann Arbor, in its own shops.

Safety Car Heating & Lighting Co. has ordered 50 refrigerator cars from Pullman Car & Mfg. Corporation.

Chicago & Eastern Illinois is in the market for 500 steel gondola car bodies.

Chicago, Milwaukee, St. Paul & Pacific has ordered 500 70-ft. gondola cars from Pressed Steel Car Co. and a like number from Bettendorf Co.

New York, New Haven & Hartford has changed its inquiry for 75 coke car bodies to 75 complete coke cars.

Pacific Coast

Two Pipe Lines Take 4750 Tons of Plates—Bids Opened on 10,000-Ton Project

SAN FRANCISCO, Sept. 7 (*By Air Mail*).—Demand for iron and steel products on the Pacific Coast has shown little sign of improvement during the past few weeks. Two pipe line projects in Vancouver, B. C., involving 4750 tons of plates, were placed and bids were opened on a 10,000-ton pipe line at Everett, Wash., on which the Western Pipe & Steel Co. was low bidder. The Pacific Coast Steel Co. took 2300 tons for a wharf in Oakland and the East Bay Municipal Utility District, Oakland, placed over 1000 tons of cast iron pipe.

Pig Iron.—Pig iron inquiries and sales are confined to small lots. Foundry operations continue on a restricted basis. No change in quotations has occurred.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards this week exceeded 2400 tons. In addition to the 2300-ton wharf project, mentioned above, the Pacific Coast Steel Co. took 100 tons for a hotel at Metaline Falls, Wash. Pending business is not large. Out-of-stock prices in the San Francisco district continue on a fairly firm basis at 2.30c., base, on carload quantities and at 2.60c. on smaller tonnages. Los Angeles prices are $2 a ton higher. Demand for mild steel bars has shown little improvement and movement continues to be confined to small lots of numerous sizes. Prices on this class of material are firm at 2.35c., c.i.f. coast ports.

Plates. — Vancouver, B. C., has awarded two pipe lines. One project called for 4000 tons and was placed with Harrison & Lamond Construction Co. and the other, amounting to 750 tons, was placed with the Vancouver Engineering Works. James Coyne, Portland, was awarded the general contract for a pipe line at Bremerton, Wash., involving 3000 tons of plates. The subcontract for the fabrication of the pipe has not been let. Other business was confined to lots of less than 100 tons. Prices remain firm at 2.35c., c.i.f.

Shapes.—Structural shape bookings included a boiler shop at Hillyard, Wash., for the Great Northern Railroad Co., calling for 180 tons, and placed with the Hofius Steel & Equipment Co. The St. John's River bridge, Portland, will require 8300 tons instead of 7000 tons, as previously reported. The Wallace Bridge & Structural Steel Co. will fabricate 6000 tons and the United States Steel Products Co. 2000 tons; 300 tons for approaches has been placed with the Gilpin Construction Co. Pending business calls for more than 7000 tons. Plain material is firm at 2.35c., c.i.f. coast ports. Foreign material is quoted around 1.70c., c.i.f., duty paid.

Cast Iron Pipe.—Among cast iron pipe awards of the week was 1343 tons of 4 to 12-in. Classes C and D pipe for Vancouver, B. C., of which 850 tons was placed with Evans, Colman & Evans and 493 tons with Gordon & Belyea. The East Bay Municipal Utility District, Oakland, placed 818 tons of 6 to 12-in. Class 150 pipe with the American Cast Iron Pipe Co., 127 tons of 6-in. Class 150 pipe with the Pacific States Cast Iron Pipe Co., and 109 tons of 8-in. Class 150 pipe with the United States Pipe & Foundry Co. The Spring Valley Water Co., San Francisco, has awarded to an unnamed company 182 tons of 8-in. Class 150 pipe. All bids were rejected on 112 tons of 4 to 8-in. Class B pipe for Estelle Street, San Diego. No action has yet been taken on 377 tons of 6 to 10-in. Class B pipe for Anaheim, Cal., the low bidder being the United States Pipe & Foundry Co. New inquiries include 460 tons of 4 to 8-in. Class B pipe for Chesterton Street, San Diego, and 230 tons of 4 and 6-in. Class C pipe for Cable Street, San Diego, bids on both to be opened Sept. 23.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Books Opened for Fourth Quarter—Plates, Shapes and Bars Reduced $2 a Ton

BIRMINGHAM, Sept. 10. — Books were opened last week for fourth quarter pig iron at the base price of $14.50 for No. 2 foundry. Sales to district consumers have been active since the books were opened for the last quarter, although the buying movement cannot be called heavy. Inquiries and private negotiations for tonnages point to heavier covering than has been the case in the preceding quarters this year. Most of the fourth quarter business booked so far has been for shipment to points outside the Southern territory. Prices on outside sales have been reduced from the $14.50 base to meet competition in other territories, but in general they are firmer than two weeks ago. On the larger tonnages, sales at $13.50 have been reported in competitive territories. Shipments remain active, and the margin over output is gradually being increased. There have been no changes in furnace operations during the past two weeks. Of the 14 active furnaces, five are on basic and nine on foundry iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Effective last week, quotations on bars, plates and structural shapes were reduced from 2.20c. to 2.10c. At the same time galvanized sheets were reduced from 3.75c. to 3.70c. Prices on other grades of sheets are unchanged. These prices are announced as minimum; on small tonnages there is a range upward of $1 to $2 a ton. The volume of new business in all important lines of finished steel, with the exception of rails, has been larger in the past three weeks than in the similar period just preceding. Prospects are reported good for important rail tonnages. Further curtailment of operations of structural steel fabricators is reported. Orders last week for structural steel were in small lots. Reinforcing bar manufacturers continue to rely on small orders to maintain operations. The Tennessee company has four open-hearths in operation at Ensley, one more than last week. Seven are active at Fairfield, and the Gulf States Steel Co. is still working all six at Alabama City.

Old Material.—Steel scrap, particularly rails, continues to show strength. Cast iron grades are slow. All prices are the same as a week ago.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.50
Tramcar wheels	13.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

Cast Iron Pipe.—No definite improvement is reported by pressure pipe manufacturers, as new business continues at a rate a little less than the output of the foundries. Nearly all the present buying is in small orders. Included in the pending tonnage is 3700 ft. of 6 and 8-in. pipe for Brooklet, Ga., to be awarded Sept. 16; 11,600 ft. of 4-in. and 3700 ft. of 6-in. to be awarded at St. Joseph, La., Sept. 17, and nine miles of 16 to 20-in. pipe for Griffith, Ga., to be awarded about Oct. 1. Shipments are steady at a

rate equaling output. Price remain at $37 to $38 a net ton, base Birmingham.

Coke.—Demand for foundry coke is stronger, and the movement has improved slightly over that of the previous week. Prices remain at $5 a net ton, Birmingham.

Boston

Pig Iron Prices Appear Firmer—Fourth Quarter Needs Not Fully Covered—Scrap Trend Mixed

BOSTON, Sept. 10.—Pig iron prices appear firmer, although they have not actually changed. Sales the past week approximated 7000 tons, but the only sizable one was 2000 tons of Southern iron to a Massachusetts textile machinery maker. Other sales were in small lots, mostly for fourth quarter delivery. The only sizable open inquiry is for 500 tons from a Connecticut melter. One foundry may soon come into the market for 2000 tons and another for 1000 tons. It is clear that the New England foundry industry is not fully covered for fourth quarter, and continued buying is expected this month.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25		$21.28 to $22.28
†Buffalo, sil. 2.25 to 2.75	21.78 to	22.78
*Buffalo, sil. 1.75 to 2.25	21.91 to	22.91
*Buffalo, sil. 2.25 to 2.75	22.41 to	23.41
East. Penn., sil. 1.75 to 2.25	22.65 to	23.15
East. Penn., sil. 2.25 to 2.75	23.15 to	23.65
Va., sil. 1.75 to 2.25		25.21
Va., sil. 2.25 to 2.75		25.71
*Ala., sil. 1.75 to 2.25		23.61
*Ala., sil. 2.25 to 2.75		24.11
†Ala., sil. 1.75 to 2.25	19.75 to	20.25
†Ala., sil. 2.25 to 2.75	20.25 to	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Cast Iron Pipe.—R. D. Wood & Co. were awarded the pipe, fittings, valves and hydrants required for the Gray, Me., water system, totaling about 250 tons. North Kingston, R. I., has plans for a water system. Domestic pipe makers, owing to their sold-up condition, have not been active bidders for the small amount of business available lately. French makers, on the other hand, have taken several hundred tons recently at prices reported to be slightly under domestic quotations. So far this month, 7072 pieces of French cast iron pipe have been landed at Boston. Open prices on domestic pipe are: 4 in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12 in., $40.10 to $41.10; 16 to 20 in., $39.10. A $3 differential is asked on Class A and gas pipe.

Imports and Exports.—Imports of pig iron at Boston in August totaled 1943 tons, of which 1443 tons was Indian and the remainder Dutch. Imports in July, this year, were 950 tons, and in August, last year, 1095 tons. Imports in August were the largest in several months. Imports of ores consisted of 6750 tons of Bona, 11,380 tons of Newfoundland and 7950 tons of Bizerta, a total of 26,080 tons, as compared with 23,260 tons in July, this year, and 16,084 tons in August, 1928. During August about 3500 tons of scrap was exported to Danzig.

Coke.—By-product foundry coke consumption in New England is running somewhat ahead of that of a year ago. The price of such fuel holds firmly at $11 a ton, delivered within a $3.10 freight rate zone. Notwithstanding that New England's coke producing capacity will be greatly increased during the next six months, it is certain that ovens will be pushed to the limit to supply wants in that period.

Reinforcing Steel.—Business placed with local mill representatives the past week totaled about 200 tons of billet steel bars. About 2000 tons is still pending. On the general run of bookings the price is 2.66½c. a lb., base, from stock, but that price has been shaded on recent round lots. The rail steel bar market is inactive, with 2.26½c. a lb., base, delivered common Boston freight rate points, the open quotation.

Old Material.—Some local brokers report that heavy melting steel shipments are held up, but others continue to make liberal shipments into the Pittsburgh district, particularly to Weirton. Brokers are paying $12.50 to $12.75 a ton on cars, shipping point, for outside shipment and around $12 for Worcester, Mass., delivery. Shipments of T and girder rails also are held up, and in such cases brokers offer only $10.50 a ton for girders, against $11 and $11.25 by those making shipments. A wide spread is also noted in forge flashing quotations, some buyers offering $10 to $10.50 a ton and others $10.75 to $11. Lighter demand for axles and shafting is reflected in easier prices. New England foundries are taking machinery cast rather freely at steady prices. The export market apparently has gone stale, one report says because of labor troubles and another report because of a lack of vessel space.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.00 to $12.75
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.25
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	7.00 to 7.50
Cast iron borings (steel works and rolling mill)	6.50 to 7.00
Bundled skeleton, long	10.00 to 10.25
Forge flashings	10.25 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.50
Shafting	14.00 to 14.50
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	9.75 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.50
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.00 to 18.50

Buffalo

Pig Iron Inquiry Totals 20,000 Tons—Steel Mills Operating at 90 Per Cent

BUFFALO, Sept. 10.—The pig iron inquiry reported this week totals 10,000 tons, of which the largest is a 1500-ton lot of foundry for an Eastern melter. From Eastern sources comes also a 500-ton inquiry for malleable. Considerable iron in small lots has been placed, and this includes two orders, one of 800 tons of foundry and one of 900 tons. The $18 base appears to be prevailing in the East, though the differentials for silicon have been ignored in some instances. The base price in the district remains at $19.50.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—There has been a slight tapering of mill operations in this district, but scarcely enough to make a difference in the general average, which is 90 per cent.

Inquiries for fabrication of structural steel have not been so heavy as heretofore, and the only job of size in immediate prospect is an apartment house in Buffalo which calls for 300 tons. A good volume of small reinforcing bar orders has been placed. The Lackawanna plant of the Bethlehem Steel Co., which in August broke a plant record with 170,000 tons of ingots, expects to equal this production this month.

Old Material.—One of the large interests is expected into the market some time this week for a considerable tonnage of No. 1 heavy melting steel. Mill operation is tapering slightly, but the demand for shipment of scrap is continuing. Little scrap is coming here from outside districts, most of it being shipped to Pittsburgh and to Weirton. A sale of cast iron borings is reported here at $12.50 and this has made a more or less active market for the blast furnace material. Dealers are reported to be paying $14.50 to $14.75 for No. 2 steel against an old order, though this condition may soften somewhat, as one of the larger users of No. 2 steel is reported to be loaded up. Some sales of short rails are reported at $19.50 and some sales of No. 1 machinery cast at $16.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.50 to $18.00
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	9.00 to 9.50
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	19.50 to 19.75
Coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.00 to 20 50
Electric Furnace Grades:	
Short shov. steel turnings	12.50 to 13.00
Blast Furnace Grades:	
Short mixed borings and turnings	11.50 to 12.25
Cast iron borings	11.50 to 12.25
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	16.00 to 17.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

St. Louis

Pig Iron Buying Improves and Price Situation Is Firmer—Steel Orders Expand Slightly

ST. LOUIS, Sept. 10.—A further improvement in buying, as well as in the general tone of the pig iron market, is reported. Sales of the St. Louis Gas & Coke Corporation, which showed a substantial gain over those of the previous week, were approximately 6000 tons, while an additional 1000 tons was sold by Southern makers. The market is firmer because of a strengthening in the Southern situation. The makers in that section are said to have taken all the business they care for at the recent low levels. Melters are buying conservatively, some still having a feeling of uncertainty as to the future course of prices. The Granite City maker's sales included two lots of 1000 tons each to northern Illinois melters, 600 tons to a local machinery manufacturer, 300 tons to a northern Iowa jobbing foundry, 270 tons to a local engine builder and 200 tons to a Kansas machinery manufacturer, all for the remainder of the year. The Granite City furnace shipped 31,000 tons in August, compared with 20,000 in August, 1928.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	$16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—An improvement in buying of domestic grades of coke by dealers is reported, especially by dealers in St. Louis. With the melt well maintained, there is a good demand for foundry coke, and shipments of furnace grades in the district continue heavy.

Finished Iron and Steel.—The Granite City Steel Co. has opened its books for fourth quarter business on sheets and plates at the prices which prevailed for third quarter, as follows: Galvanized, 3.70c.; black, 3.05c.; blue annealed, 13-gage, 2.45c.; blue annealed light plate, 10-gage, 2.30c.; plates, 2.05c., all f.o.b. Gary. The company is now operating on 100 per cent schedules in all departments except plates, where operations are on an 85 to 90 per cent basis. While there has been a let-up in incoming business, an improvement was noted during the past week. Warehouse business during August was said to be about equal to that of August, 1928, but slightly less than July of this year. The structural trade is quiet.

Old Material—The market for old material is a bit easier than a week ago, with dealers paying $14.50 to $15 for No. 1 heavy melting or shoveling steel and $14 to $14.50 for No. 2 heavy melting or shoveling steel. The movement of old material to this market, especially from country dealers, is said to be on the increase. On the other hand, buying by consumers is light. Railroad lists: Baltimore & Ohio, 19,070 tons; Atchison, Topeka & Santa Fe, 7860 tons; Wabash, 3980 tons; International-Great Northern, 900 tons; Ann Arbor, 397 tons; New Orleans Great Northern, 105 tons; St. Louis-San Francisco, 22 carloads; Nashville, Chattanooga & St. Louis, 17 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.50 to $15.00
No. 2 heavy melting or shoveling steel	14.00 to 14.50
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	17.00 to 17.50
Railroad springs	19.50 to 20.00
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	14.50 to 15.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	17.25 to 17.75
Machine shop turnings	7.50 to 8.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	13.00 to 13.50
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

The Republic Iron & Steel Co., Youngstown, will install three Rust zone-control triple-fired continuous slab heating furnaces in its plate mill. Each furnace will have an output of 25 tons an hour and will be fired with producer gas. The triple-fired design embodies a soaking chamber as well as a heating chamber.

Cincinnati

Pig Iron Sales Total 12,000 Tons—Southern Prices Stiffen —Sheet Sales Increase—Scrap Easier

CINCINNATI, Sept. 10.—Sales of pig iron the past week totaled approximately 12,000 tons. Many district consumers entered the market to cover for the remainder of the third quarter and in many instances for the fourth quarter. Of the tonnage placed, about half went to Northern furnaces and the remainder to Southern producers. The Northern iron was sold on present schedules without concessions, but the Southern iron went at prices which figure back to $13.50 and $14, base Birmingham. Although this price variance still indicates softness in the Southern market, the tendency is toward higher quotations, causing the Southern market here to have the appearance of greater firmness. Southern furnaces, which about a month ago were reported to be accepting orders at $13, are now maintaining quotations at $13.50. Even at this price, selling agents are writing orders subject to acceptance of the furnace, because in a few instances such orders were rejected and $14 was authorized as the lowest quotation. Among the week's orders was one from a Springfield, Ohio, consumer for 500 tons of Northern iron and another from a Sidney, Ohio, buyer for 200 tons of Northern, 200 tons of Southern and 100 tons of silvery. Except for an inquiry for 300 to 400 tons of Southern iron from a Louisville, Ky., consumer, there is no sizable business before the trade.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—New tonnage placed with district sheet mills last week exceeded production, adding still further to present backlogs. The entry of automotive manufacturers for fourth quarter sheet requirements, combined with the steady demand from the electrical equipment, highway and roofing fields, have added to orders. With mills promising three to four weeks as the earliest shipments, buyers are anticipating their needs at least 30 to 40 days. Prices continue firm in all grades of sheets except galvanized. Conflicting reports of concessions in the Southeast have contributed an undertone of uncertainty to this product.

Coke.—Specifications for beehive and by-product foundry coke are a trifle better than last month, although in a few instances a slight recession is noticed. The only new business reported during the week was an order from a southern Ohio consumer for 5000 tons of beehive foundry coke to cover requirements for the next eight months.

Old Material. — Although price schedules have not been changed during the past week, continued reluctance of mills to pay higher prices for old material has forced dealers to lean toward the bottom of price spreads in bidding for scrap. Accordingly, while the market appears firm on the surface, there is a slight undertone of softness, with buyers taking only what they need and dealers covering for old commitments and marking time. The supply of the better grades of scrap has increased somewhat, bringing a little relief from the tight situation that has prevailed in the last two months. The Southern Railway is offering its usual list of old material. The Chesapeake & Ohio has published a list of 6800 tons and the Norfolk & Western is offering 7500 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.25 to $14.75
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.75
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.25 to 14.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.

Canada

Pig Iron Buying Gains Moderately

TORONTO, ONT., Sept. 10.—Sales of merchant iron were at a good level throughout the week, the total showing an improvement over that of previous weeks. While some future buying is being done, most of this business is being held up until producers formally open their books, which probably will be in about a week. The daily melt continues at a high level. Prices are unchanged.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60

Delivered Montreal

No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50

Imported Iron, Montreal Warehouse

Summerlee	$33.50
Carron	33.00

Structural Steel. — Awards during the past week were small in number and tonnage. Most of the buying was in lots under 200 tons each. Prospective structural steel business is large.

Old Material.—Buying is becoming more general, and tonnages moving are individually larger than those of recent weeks. Prices are firm but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00

Standard carwheels	15.00	....
Malleable scrap	14.00	....

Detroit

Automobile Industry's Activity Up Slightly

DETROIT, Sept. 10.—Production activity in the automotive industry as a whole has shown some improvement in the last two weeks. In August several of the automobile companies exceeded their July production. These include Buick, Ford, Graham-Paige, Hupp and Packard.

The accompanying table gives the

	July	August	September Estimate
Auburn	2,026	2,509	3,900
Buick	26,279	28,971	26,550
Chevrolet	137,831	109,968	100,000
Ford	180,804	205,634	200,000
Franklin	1,325	1,150	1,000
Graham-Paige	4,849	6,576	5,500
Hudson and Essex	23,707	17,316	15,000
Hupp	2,494	5,255	5,000
Packard	4,600	5,336	5,000
Nash	6,672	3,624	3,000

available August production figures.

The Murray Body Corporation of America is producing 1250 bodies a day, increased from 400 a day three months ago. Full capacity production will extend through the current month on bodies for Chrysler, Dodge, Hupp and Ford cars. A further increase in facilities will be available in about 90 days, which will bring the total daily capacity to approximately 1750 units.

The Fleetwood Body Corporation has recently established a Detroit plant for Cadillac and La Salle chassis. The new unit, when under full production, will employ about 200 men and occupy 635,000 sq. ft. of floor space.

Steel Corporation's Orders Drop 429,966 Tons

The United States Steel Corporation on Tuesday reported the largest drop in its unfilled orders since the spring of 1928. The decline was 429,966 tons, leaving the total as of Aug. 31 at 3,658,211 tons, which was 34,168 tons above that of Aug. 31, 1928.

It was the fourth consecutive monthly decrease, but the three which preceded were much smaller. At the end of May the orders declined 123,602 tons; in June there was a further reduction of 47,257 tons, and in July the decrease was 168,733 tons.

Unfilled tonnage at the end of each month for the past three years follows:

	1929	1928	1927
August ...	3,658,211	3,624,043	3,196,037
July	4,088,177	3,570,927	3,142,014
June	4,256,910	3,637,000	3,058,246
May	4,304,167	3,416,822	3,050,941
April	4,427,563	3,872,133	3,456,132
March ...	4,410,718	4,335,206	3,553,140
February..	4,141,341	4,398,189	3,597,119
January ..	4,109,487	4,275,947	3,800,177
	1928	1927	1926
December.	3,976,712	3,972,974	3,960,696
November.	3,673,000	3,454,441	3,807,447
October ..	3,751,030	3,341,000	3,683,661
September.	3,698,368	3,148,113	3,593,500

Use of Business Statistics Proves a Stabilizer

WASHINGTON, Sept. 10.—Discussing business stability at a conference with the press yesterday, Secretary of Commerce R. P. Lamont said that an examination of the monthly statistics of industrial activity in the United States since the war shows a reduction in range of those variations which are of a seasonal character. Not only has there been, since 1921, an unusually prolonged period substantially free from so-called crises or ups and downs in economic activity representing the so-called business cycle, but even those variations from month to month of the year, which are the result of seasonal influences and which were formerly considered inevitable, have been cut down in extent, the Secretary declared.

"This result must be attributed largely to greater foresight on the part of business men producing and selling commodities as well as on the part of buyers of goods," he continued. "An important factor in making possible the exercise of such foresight is the great and growing volume of current statistical information furnished to the public by the government and by private organizations. Moreover, business men, and in fact all people, have learned to make more constant and more intelligent use of such statistics in the guidance of their affairs."

Republic to Build New Conduit Department

The Republic Iron & Steel Co. on Tuesday announced plans for a new mechanical tubing and conduit department to be built at Warren, Ohio, involving an expenditure of $1,000,000. Plans have been prepared by the company's engineering department, according to President E. T. McCleary, and will be submitted to directors at their next meeting.

The plant will employ about 500 men, and will represent additional capacity. The Republic company now operates a conduit department in Brooklyn, which commenced operations a month ago.

Shipping Board to Sell 22 Vessels for Scrap

WASHINGTON, Sept. 10.—Bids will be received up to Oct. 8 by the Shipping Board for the purchase for scrapping of 22 steel cargo vessels, 12 of which are laid up at Norfolk, Va., eight at New York and one each at Mobile, Ala., and New Orleans. In addition to bids contemplating scrapping, the board will also consider propositions for the purchase and conversion to Diesel propelled vessels, or to barges. It will also be provided in the advertisement that bids contemplating scrapping of steamers abroad will be given consideration.

Chromium Plating Now a Well Recognized Industry

From very small and modest beginnings, dating back only a few years, the chromium plating industry has had a phenomenal growth. Starting with the small installation at Columbia University, which demonstrated the far-reaching industrial applications and the adaptability of chrome plating to commercial practice, there are today some 500 plants located in all parts of the world.

At the coming meeting of the American Electrochemical Society to be held at Pittsburgh, Sept. 19 to 21, Prof. Frank C. Mathers and Chester M. Alter of the University of Indiana, Robert J. Piersol, of Pittsburgh, Lawrence E. Stout and A. W. Petchaft, of St. Louis, and H. H. Willard and R. Schneidewind, of Ann Harbor, Mich., will be among the contributors on their experiences in the chromium electroplating art.

COMING MEETINGS

SEPTEMBER

American Electrochemical Society, Sept. 19 to 21. Fall meeting, William Penn Hotel, Pittsburgh. Colin G. Fink, Columbia University, New York, secretary.

American Refractories Institute. Sept. 24 and 25. Fall meeting with Refractories Division of the American Ceramic Society, Deshler-Wallick Hotel, Columbus, Ohio. Dorothy A. Texter, Oliver Building, Pittsburgh, secretary.

American Drop Forging Institute. Sept. 25 to 27. Fall meeting, Buckwood Inn, Shawnee-on-Delaware, Pa. C. H. Smith, president, Steel Improvement & Forge Co., Cleveland, chairman of convention committee.

Concrete Reinforcing Steel Institute. Sept. 30 to Oct. 2. Semi-annual meeting, Wawasee Hotel, Wawasee, Ind. M. A. Beeman, 2112 Tribune Tower, Chicago, secretary.

National Industrial Advertisers' Association. Sept. 30 to Oct. 2. Eighth annual convention, Gibson Hotel, Cincinnati. Benjamin H. Miller, 420 Lexington Avenue, New York, secretary.

National Machine Tool Builders' Association. Sept. 30 to Oct. 4. Second machine tool exposition, Public Auditorium, Cleveland. E. F. DuBrul, 617 Vine Street, Cleveland, manager.

National Safety Council. Sept. 30 to Oct. 4. Eighteenth annual congress, Stevens Hotel, Chicago. W. H. Cameron, 108 East Ohio Street, Chicago, managing director.

OCTOBER

Society of Automotive Engineers. Oct. 2 and 3. Production meeting, Hotel Cleveland, Cleveland. Coker F. Clarkson, 29 West Thirty-ninth Street, New York, secretary.

American Society of Mechanical Engineers. Oct. 7 to 10. Third national fuels meeting, Bellevue-Stratford Hotel, Philadelphia. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

Metallurgical and Mining Advisory Boards (Carnegie Institute and Bureau of Mines). Oct. 18. Third open meeting, 4800 Forbes Street, Pittsburgh. John D. Beatty, Carnegie Institute of Technology, Pittsburgh, secretary.

American Society of Mechanical Engineers. Oct 21 to 23. Sectional meeting, Portage Hotel, Akron, Ohio. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

Society of Industrial Engineers. Oct. 23 to 25. Sixteenth national convention, Hotel Statler, Cleveland. George C. Dent, 205 West Wacker Drive, Chicago, secretary.

American Gear Manufacturers Association. Oct. 24 to 26. Fall meeting, Benjamin Franklin Hotel, Philadelphia. T. W. Owen, 3608 Euclid Avenue, Cleveland, secretary.

American Iron and Steel Institute. Oct. 25. Thirty-sixth general meeting, Hotel Commodore, New York. E. A. S. Clarke, 75 West Street, New York, secretary.

Non-Ferrous Metal Markets

Copper Sales Are Largest on Record—Lead Active—Tin and Zinc Dull

New York, Sept. 10.

Copper.—Sales in the week ended Saturday, Sept. 7, amounted to more than 100,000 tons, thereby setting a new record for the industry. Demand from both domestic and foreign buyers was unusually heavy and was stimulated by a threatened advance in prices. With the exception of a few orders for early December delivery, users are asking for shipment in the next three months and the fact that they apparently are not anticipating their requirements further ahead shows to what a low point they had permitted stocks to dwindle during the summer. With its competitors refusing to follow its lead in raising quotations on electrolytic copper ¼c. a lb., the leading producer has abandoned its attempt to secure business at 18.25c., delivered in the Connecticut Valley, and the market again is steady at 18c. Buying yesterday and today dropped off sharply as a natural consequence of the abnormal activities of the past two weeks and of the disappearance of the likelihood of higher prices. Late this week the August figures on copper stocks will appear. Some producers are of the opinion that they will reveal a further slight increase in the total blister and refined stocks, although the effects of the curtailment of output were reflected in the June and July statistics and therefore the stocks on Aug. 31 may have been approximately the same as at the end of July. Whatever the figures may be, they are not likely to affect prices, which producers believe will stay at the present level for an indefinite period. Lake copper has been showing strength and is steady at 18c. to 18½c., delivered.

Lead.—The volume of business in the past week was on a par with that of the previous week, with the result that sales in the past fortnight were the largest of the year. It is only natural, under the circumstances, for producers to expect an easing off in buying this week. Practically all orders call for delivery in September, October and the early part of November. On Thursday, Sept. 5, the American Smelting & Refining Co. increased its price to 6.90c., New York, and the leading interest in the West advanced its quotations a corresponding amount to 6.70c., St. Louis. The market is now firm at these figures.

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Sept. 10	Sept. 9	Sept. 7	Sept. 6	Sept. 5	Sept. 4
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½	18.12½
Electrolytic copper, N. Y.*	17.75	17.75	17.75	17.75	17.75	17.75
Straits tin, spot, N. Y.	45.37½	45.50	....	45.50	45.75	45.75
Zinc, East St. Louis	6.80	6.80	6.80	6.80	6.80	6.80
Zinc, New York	7.15	7.15	7.15	7.15	7.15	7.15
Lead, St. Louis	6.70	6.70	6.70	6.70	6.70	6.55
Lead, New York	6.90	6.90	6.90	6.90	6.90	6.75

*Refinery quotation; price ¼c. higher delivered in the Connecticut Valley.

Rolled Products

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ..... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.

Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.75c.
Lead, wide	11.35c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	21.12½c. to 22.12½c.
Copper, hot rolled, base sizes	27.75c. to 28.75c.
Copper, cold rolled, 14 oz. and heavier, base sizes	30.00c. to 31.00c.
Seamless Tubes—	
Brass	26.00c. to 27.00c.
Copper	29.12½c. to 30.12½c.
Brazed Brass Tubes	29.12½c. to 30.12½c.
Brass Rods	18.87½c. to 19.87½c.

New York Warehouse

Delivered Prices, Base Per Lb.

- *Zinc sheets (No. 9), casks* ..... 10.50c. to 11.00c.
- *Zinc sheets, open* ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 47.50c. to 48.50c.
- Tin, bar ..... 50.00c. to 51.00c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 19.00c.
- Zinc, slab ..... 7.75c. to 8.25c.
- Lead, American pig ..... 7.62½c. to 8.12½c.
- Lead, bar ..... 9.62½c. to 10.12½c.
- Antimony, Asiatic ..... 11.00c. to 11.50c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ..... 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
- Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 30.00c. to 31.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 50.75c.
- Tin, bar ..... 52.75c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 7.75c. to 8.00c.
- Lead, American pig ..... 7.40c. to 7.65c.
- Lead, bar ..... 9.75c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.75c.
- Babbitt metal, high grade ..... 55.00c.
- Solder, ½ and ½ ..... 31.75c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.25c.
Copper, hvy. and wire	14.50c.	15.75c.
Copper, light and bottoms	12.50c.	13.75c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

Tin.—Dullness continues in spot Straits tin. In fact, buying the past week was in such negligible volume that the market was virtually at a standstill. The few sales made were for delivery in the next two months. There is a more plentiful supply of spot tin than a few weeks ago. The quietness has not materially affected quotations, which have declined only slightly during the week. Spot Straits tin was quoted today at 45.37½c., New York. At London, the downward movement of prices has halted. Spot standard is quoted at £204 5s., futures standard at £208 7s. 6d. and spot Straits at £208 5s. The Singapore market today was £213 5s.

Zinc.—With consumers trying to break prices by refraining from buying their usual requirements and with producers determined to maintain the present schedule of 6.80c., East St. Louis, for prime Western zinc, little business has been transacted in the past week. Meanwhile, stocks in the hands of users are far less than normal and sellers are confident that customers cannot long hold off replenishing their supplies.

Antimony.—The market is sluggish and consumers are manifesting little or no interest. Spot material is quoted at 8.75c. a lb., New York, duty paid. No improvement in the immediate future is expected.

Nickel.—In wholesale lots, ingot nickel is priced at 35c. a lb., shot nickel at 36c. and cathode electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

Sept. 10.—This market is strong and active. Shipments against old orders are larger. Lead prices have advanced. The old metal market is quiet and prices are unchanged.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 47.25c.; lead, 6.80c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.85c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

Awards Total 44,000 Tons—Major Part of Tonnage Is For Non-Industrial Structures

STRUCTURAL steel lettings, at 44,000 tons, showed a substantial gain over those of the previous week. About 70 per cent of the tonnage will go into hotels, educational buildings, apartment houses and other non-industrial structures. Outstanding among awards was 24,000 tons for the new Waldorf-Astoria Hotel in New York. Electrification work on the Pennsylvania Railroad will require 2400 tons.

Inquiries, totaling 26,000 tons, include 9300 tons for a New York subway section, 3000 tons for a telephone building at Pittsburgh and 2400 tons for an office building at Des Moines, Iowa. Awards follow:

WATERVILLE, ME., 165 tons, indoor field cage and gymnasium, to Lyons Iron Works.

KEENE, N. H., 125 tons, publishing plant, to New England Structural Co.

HANOVER, N. H., 107 tons, Dartmouth School, to Palmer Steel Co.

INWOOD, VT., 500 tons, substation for Connecticut River Development Co., to American Bridge Co.

BOSTON, 400 tons, school of arts, to A. L. Smith Iron Works.

BOSTON, 320 tons, dance hall and stores in Dorchester district, to New England Structural Co.

TEWKSBURY, MASS., 200 tons, substation for New England Power Co., to American Bridge Co.

WALTHAM, MASS., 300 tons, hospital, to Eastern Bridge & Structural Co.

BEVERLY, MASS., 100 tons, indoor tennis court, to New England Structural Co.

HARTFORD, CONN., 235 tons, First National Stores unit, to Lehigh Structural Steel Co.

RYE, N. Y., 150 tons, Church of the Resurrection, to Guibert Steel Co.

PORT CHESTER, N. Y., 400 tons, United Hospital, to Porcupine Boiler Works, Bridgeport, Conn.

STATE OF NEW YORK, 150 tons, highway bridge, to American Bridge Co.

NEW YORK, 24,000 tons, Waldorf-Astoria Hotel, to McClintic-Marshall Co.

NEW YORK CENTRAL RAILROAD, 1700 tons, viaduct at 241st Street, New York, to Harris Structural Steel Co.

NEW YORK CENTRAL RAILROAD, 500 tons, fabricated steel and sheet piling, docks at Toledo, Ohio, to Bethlehem Steel Co.

PENNSYLVANIA RAILROAD, 2400 tons, electrification work; 2000 tons to Bethlehem Steel Co. and 400 tons to American Bridge Co.

CAMDEN, N. J., 800 tons, City Athletic Club, to unnamed fabricator.

GRASSELLI, N. J., 200 tons, Grasselli Chemical Co., to Guibert Steel Co.

CHARLOTTE, N. C., 100 tons, Walsh Motor Co., to McClintic-Marshall Co.

HAVANA, CUBA, 2000 tons, National Hotel, to American Steel Corporation.

DETROIT, 107 tons, River Rouge bridge, to McClintic-Marshall Co.

CANTON, OHIO, 550 tons, Onesto Hotel, to Hiner Structural Steel Co.

CALION, ARK, 500 tons, bridge, to Illinois Steel Bridge Co., Jacksonville, Ill.

TACOMA, WASH., 100 tons, redecking Eleventh Street bridge, to Star Iron Works.

HILLYARD, WASH., 180 tons, boiler shop for Great Northern Railroad Co., to Hofius Steel & Equipment Co.

VANCOUVER, B. C., 4000 tons, plates, pipe line for city, to Harrison & Lamond.

VANCOUVER, 750 tons, plates, pipe line, to Vancouver Engineering Works.

PORTLAND, ORE., 1000 tons additional, St. John's River bridge, to Wallace Bridge & Structural Steel Co.

PORTLAND, 300 tons, approaches to St. John's River bridge, to Gilpin Construction Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

LYNN, MASS., 300 tons, theater.

WEST SPRINGFIELD, MASS., 200 tons, engine house.

ATTLEBORO, MASS., 150 tons, Masonic Temple.

WOBURN, MASS., 130 tons, electric lighting plant.

NEW YORK, 9300 tons, section 9, route 101, of subway at Sixth Avenue and Forty-first Street.

NEW YORK, 500 tons, tennis court building for Thompson-Starrett Co. on East Sixty-fourth Street.

BROOKLYN, 400 tons, addition to Brooklyn Edison Co.

BUFFALO, 300 tons, apartment building, 1290 Delaware Avenue for Lasser-Preyer Co.

PITTSBURGH, 3000 tons, addition to Bell Telephone Building.

NICKEL PLATE RAILROAD, 600 tons, bridge at Cleveland.

SAGINAW, MICH., 1900 tons, telephone building.

DES MOINES, IOWA, 2400 tons, office building.

DENVER, 2100 tons, viaduct.

DOUGLAS, ARIZ., 850 tons, oil treating plant for Phelps Dodge Corporation.

BREMERTON, WASH., 3000 tons, plates, pipe line; general contract to James Coyne, Portland.

EVERETT, WASH., 10,000 tons, plates, riveted pipe line; Western Pipe & Steel Co., low bidder.

Farm Implement Exports to Canada

An increase of $1,281,321 in exports of farm implements to Canada was noted for the first six months of 1929, as compared with a similar period of last year, according to George Bell, chief of the agricultural implements division of the Department of Commerce. It is believed that approximately three-fourths of this equipment will be used in the prairie provinces of Manitoba, Saskatchewan and Alberta. For the half-year period of 1929, out of a world total of $72,068,572, Canada received machinery amounting to $24,699,919, as compared with $23,418,598 for a like period in 1928, out of a world total of $54,011,857. The entire amount shipped to Canada for the whole of 1928 is placed at $46,131,912, out of a world total of $116,524,084.

Tractor engines, gas or gasoline, formed the bulk of the exports, with threshing machines, plows and harvesters following in order named.

The combined deliveries of brass and bronze ingots and billets by the members of the Non-Ferrous Ingot Metal Institute for July amounted to 7698 tons.

PERSONAL

JAMES. A. CAMPBELL, president, Youngstown Sheet & Tube Co., Youngstown, will observe his seventy-fifth birthday on Sept. 11, and will be tendered a testimonial dinner by friends and business associates in that city on the evening of that day. No formal program has been arranged. Mr. Campbell has been president of the Sheet & Tube company for 25 years and his identification with the organization began some years before. The Youngstown Rotary Club will have Mr. Campbell as its guest of honor at its weekly luncheon on his birthday.

—

JOHN GOETZ, who recently retired as vice-president and works manager of the Kempsmith Mfg. Co., Milwaukee, has organized the Goetz-Voss Corporation, Wauwatosa, a suburb of Milwaukee, to engage in the practice of consulting engineering in the designing and production of special machinery, fixtures, etc., for the metal-working industries. With him is associated Arthur E. Voss. Work has been completed on the first unit of the machine shop, tool room, experimental laboratory and office, at 430 State Street, Wauwatosa.

—

S. C. POHLMAN, vice-president and general manager, California Wire Cloth Co., is making a tour of some of the wire fabricating plants in the East.

—

FRED R. SEGHERS, formerly associated with the Chicago office of the Toledo Machine & Tool Co., Toledo, Ohio, has been appointed district sales representative for the Ferracute Machine Co., Bridgeton, N. J.

—

J. GAFFNEY has been appointed to the newly created position of assistant superintendent of the Moline Malleable Iron Co., Moline, Ill.

—

W. D. MOORE, president, American Cast Iron Pipe Co., Birmingham, and an officer of the Sand Spun Patents Corporation, the licensing company for sand spun centrifugal pipe, sailed for England last week to negotiate with British foundries on licenses for the sand spun process.

—

VIRGIL JORDAN has resigned as chief economist of the National Industrial Conference Board, New York, and has become associated with the McGraw-Hill Publishing Co. as economist and associate editor of the *Business Week*.

—

IRVING P. CHURCH, professor emeritus of applied mechanics and hydraulics at Cornell University, has been awarded the Lamme medal by the Society for the Promotion of Engineering Education.

H. F. HAWORTH and C. T. SKIPPER, of the Leyland Motor Co., England, arrived in New York on Sept. 9 and will make a tour of inspection of American automobile and machine tool plants with a view to purchasing new equipment for the modernization of the Leyland plant. They will make their headquarters at the office of Morison, Pollexfen, Blair, Ltd., 115 Broad Street, New York.

—

DR. W. S. CARNES, Canton, Ohio, president of the Car-Van Steel Products Co., spoke on "The Rediscovery of the Lost Art of the Old Damascus Sword Blade," at two luncheon clubs in Indianapolis recently.

—

OSCAR ERICSSON, Copenhagen, Denmark, general European representative of the Heald Machine Co., Worcester, Mass., is on his way to the United States to attend the National Machine Tool Exposition in Cleveland.

—

ERIK LINDHOLM, of the Aktiebolaget Servus, Stockholm, Sweden, will attend the National Machine Tool Exposition in Cleveland.

—

C. SCHINZ, Schinz & Co., Zurich, Switzerland, European representatives of a number of American machine tool manufacturers, will arrive in New York this week and will stop at the Roosevelt Hotel. He will attend the National Machine Tool Exposition in Cleveland.

—

CHARLES D. MOORE, formerly assistant open-hearth superintendent at the Johnstown Plant of the Bethlehem Steel Co., is now the superintendent of open-hearth at the Worth Steel Co., Claymont, Del.

—

A. D. EVANS, formerly in charge of development work of the American Sheet & Tin Plate Co., Shenango Works, New Castle, Pa., has joined the Wean Engineering Co., Inc., as chief engineer and takes charge of development work and all engineering. The Wean company specializes in sheet and tin mill equipment, including pack heating furnaces, automatic tinning equipment, doublers and other labor-saving devices.

—

J. B. HOLSTON has been appointed manager of the St. Louis sales office of the Wagner Electric Corporation. He was graduated from the University of Illinois and has been with the company in Chicago.

—

WILLIAM H. INSLEY, president and general manager, Insley Mfg. Co., Indianapolis, fabricator of steel, has been selected by the Indianapolis city manager league to be one of its candidates for election as city commissioner.

ARTHUR L. WHITESIDE has been put in charge of an office opened at 30 Church Street, New York, by the Hill Clutch, Machine & Foundry Co., Cleveland.

—

FRANK CARTER, former United States Government metallurgical inspector, has taken charge of the metallurgical department for James H. Knapp, industrial furnace manufacturer, Los Angeles.

—

GEORGE S. DAVISON, president Davison Coke & Iron Co., Pittsburgh, has resigned as vice-president of the Gulf Oil Corporation and the Gulf Refining Co., Pittsburgh, to devote more time to the active management of the Davison company. On Oct. 10 he will leave for Japan, where he will act as one of the delegates of the American Society of Civil Engineers to the World's Engineering Congress.

—

A. J. HENSELER has been appointed sales manager for the Whitney Metal Tool Co., Rockford, Ill.

—

E. H. WHITTEMORE has been made manager of the newly opened Boston office of the Westinghouse Electric Elevator Co. at 10 High Street, a subsidiary of the Westinghouse Electric & Mfg. Co.

—

W. A. FORBES, assistant to the president of the United States Steel Corporation, is sailing on the steamer Bremen, Sept. 12, for a two months' business trip in various industrial centers of Europe.

—

Nitriding Expert to Speak at New York Meeting

A special joint meeting of the New Jersey and New York chapters of the American Society for Steel Treating has been arranged for Thursday evening, Sept. 19, at which Dr. Adolph Fry, of Krupp's, Essen, Germany, will be the speaker. He is one of the original developers of the new nitriding process for hardening steel.

The meeting will be held in the assembly room of the Merchants' Association, Woolworth Building, New York, and preceded by a dinner in the Post Keller Restaurant in the basement of that building.

—

Ohio Founders at Toledo

The first sectional meeting of the Ohio Foundries Association, Inc., will be held at Toledo, Oct. 10. This will also be the annual meeting for the election of board members and the transaction of business. This sectional meeting will be held under the new schedule of four meetings a year, each to take place in a different part of the State.

—

A. H. Cohn & Sons, Butler, Pa., old material dealers, are constructing a yard at cost of $200,000, to handle iron and steel scrap.

Mileage Scale for Pig Iron in New England

Commerce Commission Examiner Recommends Distance Tariffs in Mystic Iron Works Case

WASHINGTON, Sept. 10.—Holding that rates on pig iron from the plant of the Mystic Iron Works, Everett, Mass., to points in New England are unreasonable, Examiner C. E. Simmons in a report made public last Saturday recommended that the Interstate Commerce Commission set up a distance scale applicable for joint line and single line rates.

The joint line rates would range from $1.85 a gross ton for 30 miles and under up to a maximum of $3.65 for 320 miles and over 280 miles. The single line rates would run from $1.65 to $3.45.

While pig iron is rated sixth class in Official Classification territory, the rates from the Mystic blast furnace range from 65 to 73 per cent of sixth class and in some instances carry a switching charge of $5 a car.

The examiner also recommended that the complainant be awarded reparation.

The report is interpreted as a victory for the Mystic furnace from the fact that the examiner held that the rates are unreasonable. The proposed scale, however, does not reduce rates to the level sought by the complainant. In this respect, it may be construed as being only a partial victory. Reference to present rates and the proposed scale shows that the latter would provide both decreased and increased rates. However, as the examiner said that the most important market for pig iron in New England is in Connecticut, the readjustment proposed would be favorable to the Mystic plant by bringing about reductions to important points in Connecticut along with other reductions.

The present rate from Everett to Hartford is $2.90 a ton, while the proposed single line rate would be $2.45 and the joint line rate $2.35. The rate to Waterbury and Bridgeport now is $3.20, while the proposed single line rate would be $2.65 and the joint line rate $2.85. Moreover, deliveries to Connecticut points carry a switching charge of $5 a car. To nearby points the proposed scale would carry slight increases and to some of the more distant points also it would carry increases. For example, the present rate of $2.65 to Rutland, Vt., would be increased to $2.85 for single line hauls and to $3.05 for joint line hauls.

The Hudson Valley Coke & Products Corporation, Troy, N. Y., intervened in the case and held that the present relationship in rates from Everett and Troy to the destinations involved, points in Massachusetts, Rhode Island, Connecticut, Maine, New Hampshire and Vermont should be continued and that any relief granted Everett, located in the Boston switching district, should also be reflected in the rates from Troy.

The Mystic furnace is served by the Boston & Albany and the Boston & Maine. Shipments destined to points on the New York, New Haven & Hartford are switched by connecting carriers to an interchange point in Boston with the New Haven. The furnace also is served by boat through Boston harbor.

The furnace receives no allowance out of line-haul rates for weighing, loading and unloading services, but the railroads absorb a loading charge of 60c. on imported pig iron shipped from Boston.

The complaint alleged that the Mystic furnace was unable to compete in New England with pig iron producers at Buffalo and Port Henry, N. Y., Erie, Hokendauqua, Reading, Bethlehem and Swedeland, Pa. The principal competition was said to come from Buffalo. From Buffalo the rate is $4.91 for distances ranging from 397 to 620 miles.

The examiner said that the Mystic plant has been compelled to seek markets at Baltimore, Philadelphia, Brooklyn and Jersey City. Shipments to the latter points, approximating 20 per cent of the complainant's output, were said to move by water. At present, the report said, the complainant has a large quantity of pig iron on hand which it is unable to sell. The cost of assembling raw materials at Everett was shown to be materially higher than that of its competitors, according to the report. The greater portion of the raw materials received at Everett, it was pointed out, is obtained from distant points while the raw materials of competitors are received from points nearer and more adjacent to their plants.

Bethlehem to Issue 800,000 New Shares of Common

E. G. Grace, president, Bethlehem Steel Corporation, announced on Tuesday (Sept. 10) that the directors had authorized the issuance of 800,000 new shares of common stock in the ratio of one share for each three shares held on Sept. 20. The price of the new shares is to be $110.

Funds derived from the sale of these shares, amounting to $88,000,000, will be used for the retirement of bonds. It is the corporation's intention to call for redemption on the next interest date, Feb. 1, 1930, all of its consolidated mortgage 30-year sinking fund 6 per cent gold bonds, series A. At 105, the callable price, and accrued interest this will require $50,166,000. The remainder will be used to retire or purchase other funded obligations of the corporation or its subsidiary companies.

New common stock will be issued as of Oct. 21, and will be entitled to share in dividends payable after Nov. 15. The increase will raise the number of common shares to 3,200,000. A few months ago Bethlehem issued 600,000 new shares, an increase from 1,800,000 to 2,400,000.

President Grace in an oral statement said that Bethlehem, in common with other steel companies, had experienced a falling off in new business in August, but that it was not serious and that operations are being continued at 95 per cent. He expected that output would remain on this basis throughout the month. He looked for increased buying, particularly from the railroads. Much of Bethlehem's high rate of operation is due, it was said, to heavy orders for structural material and plates, and it also has a good rail backlog. Mr. Grace was optimistic as to fall business prospects.

Obituary

ROSWELL M. BOUTWELL, treasurer Standard Horseshoe Co., Boston, died Sept. 4 at a private hospital in Brookline, Mass. He was born in Lyndeboro, N. H., May 22, 1855. He served as president of the New England Iron & Hardware Association and was a director of that organization for approximately 20 years.

—

JOHN DAVID HURLEY, president and founder of the Independent Pneumatic Tool Co., who died suddenly Aug. 15, as mentioned in this column Aug. 22, organized, about 1898, with his brother Edward N. Hurley, Sr., the Standard Pneumatic Tool Co., which was one of the first concerns to introduce air tools in railroad shops and other industries. On March 1, 1902, this company was absorbed by the Schwab interests and Mr. Hurley became identified with the Rand Drill Co., of New York. In 1905 he returned to Chicago and organized the Independent Pneumatic Tool Co.

—

WALTER CLARK FISH, former manager of the Lynn, Mass., works of the General Electric Co., died Sept. 8 at his home in Boston. He was born at Taunton, Mass., Aug. 25, 1864, studied two years at Harvard University, and was graduated from Massachusetts Institute of Technology in 1887.

—

JOHN S. WOOLFORD, president G. Woolford Wood Tank Mfg. Co., Philadelphia, died at his country home, Newfield, N. J., Sept. 7, in his eighty-sixth year, after a brief illness. Upon the death of his older brother, George Woolford, in 1911, he was elected president of the company, and has been its active head since that time.

Automobiles "junked" in the United States in 1928 numbered 2,213,000, according to the American Motorists' Association, Washington. As domestic sales are reported at 3,220,000, it follows that the net increase in consumers' hands was 1,007,000.

Some Improvement in European Markets

British Mills Active—Tin Plate Prices Firm—Pig Iron Demand Better—American Purchases of Manganese Ore from Russia

(*By Cable*)

LONDON, ENGLAND, Sept. 9.

CLEVELAND pig iron demand has improved, but furnaces are as yet unable to accept new orders for prompt shipment. Coke prices are firmer and supplies continue limited, so that further increase in the number of active blast furnaces seems improbable.

Hematite producers are asking increased prices, but consumers, especially those overseas, are not hastening to commit themselves beyond immediate needs.

Inquiry for finished steel is fair in the domestic and export markets, and mills expect to reap the benefit of active conditions prevailing on the North East coast. Most shape mills are fully employed, and plate mills are generally moderately busy.

British users of Continental sheet bars are displaying increased interest in buying, and with demand good prices have been advanced and may go higher. The market is otherwise dull.

Tin plate prices are firm with costs increasing and inquiry good, although actual business is not yet brisk. Several works sold well ahead prior to the latest price advance and now are not pressing for orders.

Galvanized sheets are in moderate demand, especially for South Africa, but India is still quiet, although demand from that market is expected to revive before the end of the current month. Black sheets continue quiet.

The British Government is setting up a committee under Lord Weir to examine the economic and other aspects of electrification of British railroads.

British Steel Mills Are Still Busy

Inquiry Increasing—Employment Smaller in Steel Plants But Better at Blast Furnaces—Ship Workers Strike

LONDON, ENGLAND, Aug. 29.—A favorable feature of the market is the fact that certain iron and steel plants in the Cleveland district have been so busy that they have operated through the usual vacation week. Cleveland pig iron for prompt delivery is still scarce, but there is not much difficulty in securing supplies for future shipment. Meanwhile arrivals of Indian pig iron have been increasing and further shipments are expected.

Employment at blast furnaces improved in July, returns from 79 companies showing an increase of 1.3 per cent compared with June and 16.8 per cent compared with July, 1928. The number of furnaces in blast at the end of July was 167, compared with 165 at the end of June and 131 at the end of July, 1928. In steel mills, employment decreased 0.4 per cent in July, but was 5.6 per cent better than in July of last year.

While the steel industry has been experiencing a period of quiet, some branches of it are feeling an increase in inquiry, which may be the beginning of a fall buying movement. British manufacturers of railroad rolling stock have recently secured good contracts from Argentina, Peru, Rhodesia and India.

Although shipbuilding is not satisfactory, a number of orders for vessels have been and are being placed. Among recent contracts are an 8000-ton cargo ship awarded to Palmers Shipbuilding & Iron Co., Ltd., and a 9000-ton, motor-driven tank vessel placed with Swan, Hunter & Wigham Richardson, Ltd. At Belfast, shipyard joiners have been on strike for 19 weeks for a wage increase of 3s. (73c.) a week. More than 1000 joiners are affected by the strike, and a number of other employees have been thrown out of work in consequence.

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp with the £ at $4.85

British Prices, f.o.b. United Kingdom Ports

Cleveland No. 3 foundry	£3	12½s.	to £3	13½s.	$17.58	to	$17.82

Welded Merchant Ship to Be Launched Next Year

HAMBURG, GERMANY, Aug. 26.—Electrically welded ships are officially recognized as in the highest registered class by the Germanische Lloyd in its publication No. 556-1-1929. The Hamburg agency of Lloyds of London confirms the report that they also place electrically welded ships in the highest registry. German insurance companies generally have taken similar action.

In addition to the electrically welded German battleship, Panzerkreuzer A, now under construction at Kiel, a merchant vessel is being electric-welded and will be launched by Deschimag at Hamburg in January or February of next year. Built for the North German Lloyd line, this ship of 11,000 tons will be in the company's river name class, with such vessels as the Isar and the Elbe, and is expected to be operated in the Far Eastern trade.

German Industry Opposes Shipping Subsidy

HAMBURG, GERMANY, Aug. 26.—The German hardware industry has followed the example of steel and machinery producers in definitely denying that it has in any way recommended that the Government pay subsidies to industry. The entire metal industry in Germany has declared that "subventions paid directly or indirectly to shipping or shipbuilding enterprises must be refused" and points to the examples of Canada, Australia and England, where, it is claimed, the State suffers loss and the industry no advantage.

Polish Government Buys Cars

WARSAW, POLAND, Aug. 26.—The Government has placed a large order for railroad rolling stock with Polish builders, which will doubtless result in a considerable curtailment of the export expansion program of the industry. The contract includes 140 locomotives, 170 passenger, 1800 freight and 300 miscellaneous cars, and 80,000 tons of rails and track equipment.

Active Automobile Parts Exports to Germany

HAMBURG, GERMANY, Aug. 19.—An analysis of the imports of steel from the United States shows that the largest volume is in parts and accessories for automobile manufacture, shipped by American motor car builders to their German assembling plants. In the first half of this year, 84.6 per cent of the total imports from the United States was parts and accessories, 2.8 per cent special steels not intended for use in motor car construction, 2.9 per cent black and galvanized sheets, 3.1 per cent tin plate, 3.1 per cent accessories and parts used in machinery building and 3.5 per cent all other steel products. German exports to the United States consisted principally of tubes, hoops and wire.

Acid Open-Hearth Output Lower

HAMBURG, GERMANY, Aug. 26.—While the production of basic open-hearth steel is steadily increasing in Germany, output of acid open-hearth is rapidly diminishing. Of the record post-war production of steel in July, which reached a total of 1,466,072 metric tons, 740,893 tons was basic open-hearth steel. The output of acid open-hearth steel has declined from 22,871 tons in July, 1928, to 13,005 tons in July, 1929.

European Lock Cartel in Prospect

HAMBURG, GERMANY, Aug. 26.—Following the Yale & Towne Mfg. Co.'s acquisition of one of the largest British manufacturers of locks, it is reported that two more German lock manufacturers are negotiating with the American company. It is understood that British and German manufacturers will confer with officers of the American corporation at Berlin, Oct. 25, and it is expected that the meeting will result in the establishment of a closely controlled cartel or a merger of all companies into a single corporation. At its Velbert plant the Yale & Towne company is now employing about 10,000 workmen.

Germans Control Foreign Mannesmann Works

HAMBURG, GERMANY, Aug. 26.—The Mannesmann Tube Co., which recently acquired a heavy interest in the British Mannesmann Tube Works, now owns about £1,444,000 ($7,003,400) of the British company's £2,000,000 ($9,700,000) capital, about 65 per cent of the stock in the French company, Acieries et Usines de la Saar, and about 90 per cent of the stock of the Mannesmann works in Czechoslovakia.

To Stock Steel at Shanghai

HAMBURG, GERMANY, Aug. 19.—Steel exporters are endeavoring to organize the trade with China in plate cuttings, bar crop ends and other forms of second-hand steel. Thus far only moderate quantities of such material have been supplied to China by Germany, but exporters expect to establish permanent stocks in Shanghai.

Higher Rates to Africa

HAMBURG, GERMANY, Aug. 26.—Ocean freight rates on practically all hardware products from Continental ports to South Africa, which have been low in the past, in some instances only 10s. ($2.42) per ton, have been increased 200 to 300 per cent. Exporters to South Africa are pessimistic and believe that the higher rates will mean considerable loss of business to American and Japanese hardware manufacturers, especially to the Japanese, who have been unusually active lately in pressing for larger markets.

Steel Corporation Purchases Russian Manganese Ore

An Associated Press cablegram from Tiflis gives the following statement, evidently based on information from official sources there, concerning the United States Steel Corporation's recent purchase of manganese ore to be mined in the Chiatouri district and shipped from the port of Batum:

"The Georgian Government manganese trust today signed an agreement with the Carnegie Steel Co. for delivery from Chiatouri of large quantities of manganese over a period of five years. During the first year the Carnegie company will take from 60,000 to 75,000 tons of ore and, during the remaining four years, 50,000 tons annually. It was stated that the Carnegie company bought its manganese to improve Brazilian manganese, which it obtains from its own mines. The Georgian Government is continuing negotiations for the sale of quantities of ore to other large American corporations."

British May Make "Widia"

HAMBURG, GERMANY, Aug. 26.—The Friedrich Krupp A. G., Essen, is understood to have entered into negotiations with Sheffield producers of special steels to license one or more for the production of "Widia" cutting metal.

Mail from Japan in 9 Days

A letter mailed by B. P. Sweeny of Osaka, representative in Japan of the Cleveland Twist Drill Co., for transmission by the Graf Zeppelin, reached the Cleveland office in nine days. Even this might have been shortened by at least one day, for if the Graf had been a regular mail carrier, in all probability it would have dropped the Cleveland mail as it passed over that city.

As mail from Japan reaches Cleveland under ordinary circumstances in approximately four weeks, the experience indicates the startling possibilities of the airship of the Zeppelin type as a mail carrier.

Plans for the immediate construction of a new mineral industries building at the Pennsylvania State College have been announced by President Ralph D. Hetzel and Edward Steidle, dean of the School of Mines and Metallurgy. Two hundred feet in length, the building will have wings at both ends, 135 ft. deep. The four floors will contain laboratories, classrooms and offices to care for all instruction and research work in geology, mineralogy, geography, oil and gas production, mining, quarrying, metallurgy and ceramics, or clay and sand products.

Machinery Markets and News of the Works

Tool Market Remains Active

Large Order Placed for Delivery to Russia—Sales in New York District Surprisingly Good

DESPITE the tendency of some machine tool users to hold off action on pending inquiries until after the Cleveland exposition, sales have been fairly well sustained.

An Eastern seller reports that its volume of business in August was the largest of the year and other companies state that the past month compares favorably wth the best previous months of 1929. Moreover, orders in the New York district are continuing to come in steadily and the amount of buying in prospect indicates that September totals will be high.

This unusually favorable condition, however, does not exist in some other machine tool centers, although the flow of orders has been satisfactory.

A Connecticut airplane maker has added $80,000 worth of tools to previous purchases. The Western Electric Co. has placed some sizable orders and the Continental Motors Corporation has been an active buyer. The International Harvester Co. still has some standard tools to purchase for its Farmall plant.

The Amtorg Trading Corporation has contracted for 50 lathes with two American builders and is inquiring for a like number of automatic screw machines for an automobile plant to be built in Soviet Russia. This organization also is ordering equipment for a tractor manufacturing plant to be erected near Leningrad. A Cleveland maker of automatic screw machines has sold six machines for delivery to a Japanese arsenal.

New York

NEW YORK, Sept. 10.—A leading Eastern seller of machine tools did the largest business in August of any month this year. While this record was exceptional, other machine tool sellers also did a large volume, and the month as a whole in this district compared favorably with the best previous peak months. Orders so far this month, although affected slightly by the Labor Day holidays last week, are coming in steadily, and the amount of buying in prospect indicates that September totals will be high. The Western Electric Co. is one of the principal buyers. Orders are being placed by the Amtorg Trading Corporation, 165 Broadway, New York, for a new tractor manufacturing plant in Soviet Russia.

Board of Education, Flatbush Avenue Extension and Concord Street, Brooklyn, and Park Avenue and Fifty-ninth Street, New York, will soon take bids for an eight-story technical high school for boys at Fort Greene Place and DeKalb Avenue, Brooklyn, to cost about $5,500,000. W. C. Martin, address first noted, is architect.

Westinghouse Lamp Works, Inc., Bloomfield, N. J., subsidiary of Westinghouse Electric & Mfg. Co., 150 Broadway, New York, has work under way on five-story addition, 80 x 200 ft., with L-extension, 60 x 175 ft., to be equipped as a wire products plant, to cost about $700,000 with equipment.

New York & Queens Electric Co., 40 Lawrence Street, Flushing, L. I., has awarded general contract to Stamarith Construction Corporation, 444 Jackson Avenue, Long Island City, for one-story automobile service, repair and garage building at Elmhurst, L. I., for company motor trucks and cars, to cost about $100,000 with equipment.

Anaconda Wire & Cable Co., operated by Anaconda Copper Mining Co., 25 Broadway, New York, has acquired Marion Insulated Wire & Rubber Co., Marion, Ind., and will consolidate with organization. Marion plant will be developed for increased capacity as Middle West unit.

Board of Public Works, Mount Vernon, N. Y., has filed plans for a municipal automobile service, repair and garage building, to cost $105,000 with equipment.

Port of New York Authority, 75 West Street, New York, has plans for fourteen-story central freight terminal, 200 x 800 ft., in West Side district, for which site is being acquired, to include elevating, conveying and other mechanical-handling equipment, entire project to cost $9,000,000.

Eagle Bronze Works, Inc., North Bleecker Street, Mount Vernon, N. Y., has work under way on expansion at three-story plant, to cost about $60,000. George M. Bartlett, 103 Park Avenue, New York, is architect.

C. B. Meyers, 31 Union Square, New York, architect, will take bids on general contract for one-story automobile service, repair and garage building, to cost $170,000 with equipment.

Truscon Steel Co., 31 Union Square, New York, with main plant at Youngstown, has work under way on a factory branch, storage and distributing plant at Harrison, N. J., where 3-acre tract recently was acquired, to cost $100,000 with equipment. Charles D. Loveland, formerly manager of company at Pittsburgh, will be district manager of northern New Jersey, with headquarters at Newark.

Schnell Penselpen Corporation, 11 Franklin Street, New York, manufacturer of combination metal pencils and pens, has begun construction of first unit of new plant, 75 x 125 ft., at Arlington, N. J., to cost about $50,000. Present factory will be removed to new location and capacity increased.

Officials of Schultz Machine Co., Inc., Hoboken, N. J., have organized Radio Products Corporation, with capital of 200,000 shares of stock, no par value, to take over and expand Vacuum Tube Products, Inc., 219 Bloomfield Street, Hoboken, heretofore operated as an interest of Schultz company. New organization will also take over and occupy a three-story plant at 548-52 South Eleventh Street, Newark, N. J., equipped for production of radio tube parts, high-testing vacuum gages and other precision apparatus. Company has arranged for sale of block of common stock to total $1,825,000, to be used in part for expansion. Frank Schultz is president; D. R. Donovan is vice-president.

Transit Mixed Concrete Co., Hanover Avenue, Morris Plains, N. J., has plans for a central proportioning and distributing plant for concrete production, to operate under automatic mechanical system for loading motor trucks, etc., these to be equipped to mix material while en route to point of delivery. Initial plant will cost more than $50,000 with equipment.

Following completion of one-story addition now under way, to total about 13,725 sq. ft. of floor space, Otis Elevator Co., Harrison, N. J., plans removal of plant of Graham & Norton Co., 126 Eleventh Avenue, New York, manufacturer of elevator door devices and accessories, to this location, with installation of additional equipment. Graham & Norton organization was recently acquired and is now operated as a division of Otis company, which is developing Harrison works as self-contained unit for production of complete elevator cars and accessories. C. C. Campbell is manager of plant. Headquarters are at Eleventh Avenue and Twenty-sixth Street, New York.

Alfred Hofmann, Inc., 635 Fifteenth Street, West New York, N. J., manufac-

turer of knitting machinery for hosiery mills, electric lamp machinery, etc., has awarded general contract to Auf Der Heide Contracting Co., 443 Sixteenth Street, West New York, for two-story addition, 100 x 125 ft., to cost about $75,000 with equipment. Lockwood Greene Engineers, Inc., 1 Pershing Square, New York, is architect and engineer.

Philadelphia

PHILADELPHIA, Sept. 9.—Contract has been let by Schuch Machine Co., 235 New Street, Philadelphia, to Adolph Korn, 1420 Walnut Street, for two-story plant unit, 50 x 150 ft., to cost about $45,000 with equipment. Charles E. Oelschlager, 1615 Walnut Street, is architect. C. F. Schuch is head.

Woodward-Wanger Co., 1106 Spring Garden Street, Philadelphia, plumbing equipment and supplies, has filed plans for addition for storage and distributing service, with pipe department, etc., to cost $45,000 with equipment. It will replace structure destroyed by fire a few months ago. F. B. Davis & Son, Inc., 240 North Sixteenth Street, is general contractor.

Gulf Refining Co., Sydenham and Locust Streets, Philadelphia, with main offices at Pittsburgh, has awarded general contract to Cramp & Co., Denkla Building, for group of buildings at Girard Point, comprising four-story unit, 48 x 112 ft.; one-story, 40 x 83 ft., 39 x 42 ft., and 32 x 63 ft., entire project to cost more than $100,000 with equipment. Edward B. Lee, Chamber of Commerce Building, Pittsburgh, is architect.

Ballinger Co., 105 South Twelfth Street, Philadelphia, architect and engineer, has plans for three-story baking plant to include traveling ovens, power equipment, conveying machinery and other equipment, entire project to cost about $500,000.

National Umbrella Frame Co., Belfield Avenue, Philadelphia, has awarded contract to George H. Whitner, 403 East Penn Street, for second story addition and improvements in existing building.

Farman Aircraft Corporation, Philadelphia, care of N. S. Ludington, 123 South Broad Street, has awarded contract to Airport Development & Construction Co., Mitten Building, for three-story plant at Camden, N. J., for parts and assembling service, to cost more than $100,000 with equipment.

William M. Stanton, Land Title Building, Philadelphia, architect, has plans for five-story automobile service, repair and garage building at Atlantic City, N. J., to cost about $200,000 with equipment.

Abraham Shapiro, Hotel Jermyn, Scranton, Pa., and associates have organized United States Textile Machine Co., with capital of $25,000, and plan operation of local plant to manufacture machinery for silk and cotton mills. R. C. Shepherd and A. W. Thomas, both of Scranton, are interested in new company.

Board of Education, Mechanicsburg, Pa., plans installation of manual training equipment in addition to high school, to cost $180,000, for which bids have been asked on general contract. C. J. Lappley, Front and Harris Streets, Harrisburg, Pa., is architect.

Individual Drinking Cup Co., Easton, Pa., manufacturer of pressed paper drinking cups, etc., has awarded general contract to R. T. & C. D. Stewart, Easton, for three-story addition, 80 x 100 ft., to cost about $100,000 with equipment. Ballinger Co., Philadelphia, is architect and engineer.

Capital Landing Field Co., Harrisburg, Pa., recently organized by Frank A. Robbins, Jr., Daniel N. Casey and other officials of Harrisburg Chamber of Commerce, has plans by Austin Co., Cleveland, for airport on Harrisburg-York Highway, about 5 miles from city, to include hangar, 100 x 120 ft., machine and repair shops, oil storage and other units, to cost more than $100,000 with equipment.

New England

BOSTON, Sept. 9.— Buying by a Connecticut manufacturer of aircraft since Sept. 3 has enlivened an otherwise quiet machine tool market. Purchases included $50,000 worth of equipment from one local dealer and about $30,000 worth from other Boston firms, for delivery during the first quarter of 1930.

Considerable used equipment was sold the past week. Sales unquestionably would be larger if dealers had equipment wanted. Good used tools, in some instances, bring higher prices than during the war.

Small tool makers are booked ahead for the remainder of 1929, and well into the first quarter of 1930 on certain types of tools.

Hawie Mfg. Co., 729 Washington Avenue, Bridgeport, Conn., is building a two-story addition, 50 x 89 ft., and making plant alterations. Motors and other equipment will be needed.

Heil Co., Milwaukee, manufacturer of automobile bodies, has closed bids on a group of plant units to be erected at Cambridge, Mass., including a warehouse calling for a three-ton overhead traveling crane.

West Springfield, Mass., contemplates a one-story pumping station, 30 x 46 ft., for its Bear Hole reservoir, to cost $10,000 without equipment.

Lee Electric Co., Lee, Mass., has purchased Thistle Wire Works Co. local property, and plans mechanical improvements.

L. G. Balfour Co., County Street., Attleboro, Mass., has plans for a three-story, 40 x 350 ft. and one-story, 40 x 60 ft. jewelry manufacturing plant and a power plant, to cost $200,000 with equipment.

M. J. Whittall Associates, Worcester, Mass., have awarded contract to Morton C. Tuttle Co., Boston, for power house, 80 x 110 ft., to contain four boilers. Estimated cost is $200,000. Francis J. Sill, Westboro, Mass., is consulting engineer.

Virginius J. Mayo, New Haven, Conn., formerly president of Mayo Radiator Co., with local plant for manufacture of automobile radiators, is at head of project to erect a plant to manufacture metal airplanes and seaplanes, including parts and assembling departments, under a special metal process perfected by Mr. Mayo. Plant is reported to cost more than $75,000.

Providence Insulated Wire Co., 65 Wadsworth Street, Providence, has awarded general contract to Henry M. Soule, 110 Brook Street, Pawtucket, R. I., for two-story addition, 40 x 72 ft., to cost about $25,000 with equipment.

Curtis Flying Service, Inc., Boston, has filed plans for hangar with repair and reconditioning shop facilities at 9 Airport Road North, to cost about $65,000 with equipment. Headquarters are at 27-29 West Fifty-seventh Street, New York.

Almac Yacht Corporation, Mystic, Conn., is planning one-story shop, 50 x 150 ft., at Pistol Point, to cost about $35,000 with equipment.

Simplex Wire & Cable Co., 201 Devonshire Street, Boston, has awarded general contract to Chase & Gilbert, Park Square Building, for extensions in plant at Cambridge, to cost about $50,000.

Noma Electric Corporation, 340 Hudson Street, New York, manufacturer of radio tubes and equipment, has purchased plant of Everett Mills, Inc., Lawrence, Mass., totaling 1,500,000 sq. ft. floor space. Purchasing company will take possession soon and will concentrate production here, including manufacturing of its subsidiary, Pilot Radio & Tube Co., removing plants now at New York, Brooklyn, Poughkeepsie and Buffalo; Newark, N. J.; and Detroit, to new location. Joseph Block is president of Noma company.

Pease & Curran, 104 Point Street, Providence, operating a fine metals refining plant, have awarded a general contract to Charles B. Maguire Co., 507 Grosvenor Street, for one-story addition, 55 x 100 ft., to cost about $35,000 with equipment. Francis Chiaverini, 32 Broadway, is architect.

South Atlantic

BALTIMORE, Sept. 9.—Bids will soon be asked by Public Improvement Commission, City Hall, Baltimore, for addition to polytechnic high school, to cost about $1,000,000 with equipment. Charles M. Anderson, 9 East Pleasant Street, is architect; Henry Adams, Calvert Building, is mechanical engineer.

Firestone Tire & Rubber Co., Akron, Ohio, has plans for a three-story factory branch, storage and distributing plant, 85 x 230 ft., at Baltimore, to cost about $200,000 with equipment.

Simpson & Morgan Ice & Coal Co., Rockmart, Ga., is planning one-story, electrically-operated ice-manufacturing plant, to cost about $50,000 with equipment.

Sonoco Products Co., Hartsville, S. C., manufacturer of cones and other paper products, has awarded general contract to A. K. Adams Co., 542 Plum Street, N. W., for three-story and basement addition, to cost about $75,000 with equipment.

American Manganese Fertilizer Corporation, care of Albert S. Dulin, 1422 F Street, N. W., Washington, recently formed by Mr. Dulin and associates with capital of $500,000, is said to have plans for new plant near Alexander, Va., to cost more than $150,000 with equipment.

Georgia Power Co., Atlanta, Ga., has preliminary work in progress on new steam-operated electric power plant on Chattahoochee River, about 15 miles from city. Station will be equipped for initial output of 100,000 hp., and will cost more than $2,000,000 with transmission lines. Later, three additional units will be provided, making total rating of 400,000 hp. for project.

Officials of Certain-Teed Products Corporation, 100 East Forty-second Street, New York, manufacturer of roofing, paperboard products, etc., are organizing Southern Building Products Corporation, Savannah, Ga., represented by Remer L. Denmark, Savannah Fire Insurance Building, to construct local plant for manufacture of roofing products and other building specialties. Parent company recently acquired local site. Project will cost more than $80,000.

County Aviation Committee, County Supervisors, Wilmington, N. C., has plans for new buildings at Bluementhal air-

port, including hangars, repair and reconditioning shops, oil storage and other units, to cost more than $70,000 with equipment. Louis L. Merritt is designer, in charge of project.

Home Service Co., 3 Page Avenue, Asheville, N. C., D. D. Smith, president, is considering installation of steam power plant for central heating service in business district, to cost more than $500,000 including distributing system.

Detroit

DETROIT, Sept. 9.—Bids will soon be asked by Hayes Body Corporation, Seventh Street, N. W., Grand Rapids, Mich., manufacturer of automobile bodies, for a three-story addition to cost over $70,000 with equipment. A. A. Anderson is secretary and treasurer.

Hancock Iron Works, Inc., Pontiac, Mich., has asked bids on general contract for a one-story plant unit, to cost about $40,000 with equipment. Robert O. Derrick, Inc., Union Trust Building, Detroit, is architect.

Detroit Aircraft Corporation, Detroit, has taken title to 30-acre tract at Long Beach, Cal., for a new plant for parts production and assembling, to cost over $100,000 with equipment.

Wayne County Board of Supervisors, Barium Tower Building, Cadillac Square, Detroit, is planning construction of power house at County airport, to cost over $85,000 with equipment. Giffels & Vallet, Marquette Building, are engineers.

Venton Steel Sash Co., Sixth Street, Muskegon, Mich., is contemplating a one-story addition, 50 x 130 ft., to cost about $65,000 with equipment.

Clark Equipment Co., Dewey Street, Buchanan, Mich., manufacturer of automotive parts and equipment, has secured additional interest in Frost Gear & Forge Co., Jackson, Mich., with holdings totaling 90 per cent of outstanding stock, and expects to secure complete ownership for a wholly controlled subsidiary. Expansion is planned, including one-story addition at Buchanan to cost over $50,000, for which plans will be drawn by F. L. Shoemaker, Masonic Block, Sturgis, Mich., architect.

Central Machine Co., 6320 East Fort Street, Detroit, has awarded general contract to Stibbard Construction Co., 3000 Grand River Boulevard, for two-story addition to machine shop, 60 x 100 ft., to cost about $45,000 with equipment.

Paper Makers' Chemical Corporation, Kalamazoo, Mich., manufacturer of industrial chemicals, has selected 7-acre tract in Guilds Lake district, Portland, Ore., as site for new branch plant, to cost about $275,000 with equipment. Plans will be drawn at once.

Midland Steel Products Co., 6660 Mount Elliott Avenue, Detroit, has awarded general contract to Wisconsin Bridge & Iron Co., Penobscot Building, for one-story addition for storage and distribution, to cost $60,000. Company is planning to develop large increase in output of four-wheel brakes for automobiles at local plant. Main offices are at Cleveland.

Monroe Auto Equipment Co., Monroe, Mich., has perfected a two-way hydraulic shock absorber for automobile service, and is planning plant expansion to develop large output of new specialty. Production of one-way shock absorber will continue as heretofore, on basis of about 50,000 sets per month.

The Crane Market

SALES of overhead traveling cranes have not been large in the past week, but there is a substantial volume of inquiry. In the New York district a single order for overhead cranes placed last week totaled about $100,000. The United Dry Docks, Inc., Port Richmond, S. I., New York, is inquiring for a number of overhead cranes. The Wood Newspaper Machine Corporation, Plainfield, N. J., has closed on several small cranes. The New York Central Railroad is reported to have closed on a used locomotive crane with a dealer and is still in the market for two 25-ton locomotive cranes and a 20-ton, 40-ft. span stationary gantry crane.

Among recent purchases are:

Buda Co., Harvey, Ill., 7½-ton, 60-ft. span electric traveling crane from unnamed builder.

Pittsburgh

PITTSBURGH, Sept. 9.—Machine tool buying so far this month has not been in large volume and local dealers expect a rather quiet month pending the machine tool show the first week in October. Considerable interest in the proposed exhibits is being manifested in this district and important buying is expected. Several small orders have recently been placed, but no new lists of consequence have come out the past few days. A considerable number of tools is still pending.

The Westinghouse Electric & Mfg. Co. has practically completed purchases against its third quarter requirements. The United States Aluminum Co., New Kensington, Pa., has not yet placed any tools for its new machine shop, but is understood to have come to decisions on the majority of equipment, with awards expected to be made soon.

Contract has been let by Standard Steel Specialty Co., Beaver Falls, Pa., manufacturer of machine keys and kindred products, to Penn Bridge Co., College Hill, Pa., for one-story addition, 60 x 120 ft., to West Mayfield plant, to cost $75,000 with equipment.

United Aircraft & Transport Corporation, operating Standard Steel Propeller Corporation, 221 West Seventh Avenue, Pittsburgh, and other organizations, has acquired plant and business of Hamilton Aero Mfg. Co., Keefe Avenue, Milwaukee, manufacturer of steel propellers and other aircraft equipment, and will operate as a division of Standard company.

E. J. Henggi, 138 View Street, Oakmont, Pa., and associates have organized Henggi Rail Appliance Co., to establish plant for manufacture of railroad equipment and appliances. D. S. Thomas, 117 Lexington Street, Aspinwall, Pa., will be an official of new company.

Champion Switch Co., Kenova, W. Va., manufacturer of electric switches and equipment, has plans for one-story addition, to cost about $30,000 with equipment.

Airways & Aircraft Co., Farmers' Bank Building, Pittsburgh, has plans for airport development at Dravosburg, Pa., including hangars and other mechanical field units, to cost more than $85,000 with equipment. Kenneth Franzheim, 345 Madison Avenue, New York, is architect; Stone & Webster Engineering Co., Union Trust Building, Pittsburgh, is engineer.

Board of Education, Donora, Pa., is contemplating installation of manual training equipment in two-story high school to cost about $275,000, for which bids have been asked on general contract. C. C. Compton, Thompson Avenue and Fourth Street, is architect.

Cleveland

CLEVELAND, Sept. 9.—Local machine tool dealers report light sales the past week and a falling off in inquiry. Some prospective business is being held back until after the National Machine Tool Builders' Exposition in Cleveland. Business with builders of turret lathes and automatic machines is holding close to recent volume. A local manufacturer of automatic screw machines is now promising next spring delivery on some sizes. This company took an order the past week for six machines for the Japanese arsenal.

Export demand continues good for turret lathes. The Amtorg Trading Corporation is understood to have placed an order for about 50 lathes with two American machine tool manufacturers and is about to purchase a like number of automatic screw machines for an automobile plant to be built by the Soviet Government at Nishni Novgorod, Russia. This business has been pending for some time. Another Russian automotive project requiring a large amount of machinery will be a truck manufacturing plant to be built at Leningrad. It is stated that this project is being handled by the Brandt Co., engineer, Detroit.

Globe Steel Barrel Co., Cleveland, which recently acquired former Cleveland Railway power house on Washington Avenue, N. W., will remodel building and add considerable equipment to manufacture steel drums, barrels and other containers.

Toledo Steel Products Co., Toledo, Ohio, manufacturer of automobile valves, has purchased a controlling interest in Fostoria Screw Co., Fostoria, Ohio, manufacturer of bolts and bushings. It is stated that both plants will be operated as separate units but sales organizations will be combined.

Elyria Mfg. Corporation, Elyria, Ohio, maker of screw machine products, has enlarged its plant by a one-story addition, 50 x 120 ft.

Lindsay Wire Weaving Co., 14025 Aspinwall Avenue, Cleveland, has awarded general contract to J. E. Christian Co., 1307 St. Clair Avenue, for two-story addition, 50 x 120 ft., to cost about $65,000 with equipment. Bohnard & Parson, Euclid Building, are architects.

Eaton Axle & Spring Co., East Sixty-fifth Street, Cleveland, has awarded general contract to H. K. Building Co., 1319 West 103rd. Street, for one-story assembling unit, to cost over $70,000 with equipment. George S. Rider Co., Century Building, is architect and engineer.

Briggs Mfg. Co., 12825 Taft Avenue, Cleveland, manufacturer of automobile bodies, has leased adjoining property, 200 x 400 ft., formerly used by Walker Motor Co., for expansion. Headquarters are at 11631 Mack Avenue, Detroit.

John Harsch Bronze & Foundry Co., 11612 Madison Avenue, Cleveland, is contemplating a one-story plant unit on

West 121st Street, to cost about $65,000 with equipment.

B. F. Goodrich Co., Akron, Ohio, manufacturer of automobile tires, tubes, mechanical rubber goods, etc., has purchased plant and business of Hood Rubber Co., Watertown, Mass., and will consolidate. Hood company will maintain present name and will be operated as division of purchasing company.

Cream Cone Machine Co., 1874 East Fifty-ninth Street, Cleveland, has awarded general contract to Leslie Lapp, 2020 Brunswick Road, East Cleveland, for three-story addition, 60 x 65 ft., to cost about $60,000 with equipment. Jack Mohler is company architect.

Chicago

CHICAGO, Sept. 9.—Sales of machine tools easily measure up to the average week in August and fresh inquiry is more active than for some time. Gaged by requests for preliminary figures for budget preparation, the Santa Fe has in mind a large list for spring purchase. Among other railroads which are well along with future plans are the Northern Pacific and the Union Pacific. The Burlington has ordered two axle turning lathes, the Chicago, North Shore & Milwaukee has purchased several machine tools and the Chicago Rapid Transit has placed a boring mill.

Farmall division of the International Harvester Co. has closed that part of its list which called for special machinery and items on which deliveries were farthest extended. There still are a number of standard tools to be ordered. Continental Motors Corporation's list, which includes much special turning equipment and drills, is active. A local automobile parts maker has ordered two large special machines for turning rear axle housings. This order may be duplicated at an early date. Supplies of used tools are large.

Peoria Malleable Casting Co., Peoria, Ill., plans expenditure of $30,000 for an addition in which it will make malleable chain.

Kansas City Steel Foundry Corporation, Kansas City, Mo., will start operations in former plant of Kansas City Malleable Castings Corporation. Officers of company are John C. Smith, president; M. S. Murray, vice-president and treasurer, and E. Byron Gray, secretary.

Victor Products Corporation, 2633 Belmont Avenue, Chicago, will build a two-story addition, 50 x 125 ft. Cobb & Eisenberg, 123 West Madison Street, are architects.

Triner Scale & Mfg. Co., corner of Twenty-third Street and Fairfield Avenue, Chicago, has under construction a four-story and basement factory which will cost $250,000.

Variety Fire Door Co., Sacramento Avenue and Carroll Street, Chicago, has purchased former plant of Elgin Motor Co., Argo, Ill. Production will be underway in about thirty days in new plant.

H. Severin Mfg. Co., makers of special tools and dies, 4607 Ravenswood Avenue, Chicago, has purchased one-story factory of Holmes Electric Co., at 5116 Ravenswood Avenue, Chicago.

Solar-Sturges Mfg. Co., Bellwood, Ill., manufacturer of metal cans and containers, has awarded a general contract to Austin Co., Chicago, for one-story addition to plant at Melrose Park, Ill., to cost about $35,000 with equipment.

Chicago Air Service, Inc., operating Sky Harbor flying field, Glencoe district, Chicago, has leased six-story building at Eighteenth Street and South Michigan Avenue, for aircraft manufacturing plant and aviation school.

North Shore Foundry Co., North Chicago, Ill., care of John Rause, Jr., 442 North Butrick Street, Waukegan, Ill., recently formed by Mr. Rause and associates, is planning one-story foundry to cost close to $50,000, of which about $30,000 will be expended for equipment.

Standard Parts Corporation, 1020 La Salle Avenue, Minneapolis, Minn., has awarded general contract to James Leck Co., 211 South Eleventh Street, for one-story plant to manufacture automobile parts, to cost about $30,000 with equipment. Vanderbilt & Dege, 1645 Hennepin Avenue, are architects.

Iowa Railway & Light Co., Dows Building, Cedar Rapids, Iowa, has plans for a hydroelectric power house, near Rochester, Iowa, to cost about $125,000. Extensions will be made in transmission lines. Fargo Engineering Co., 226 West Main Street, Jackson, Mich., is engineer.

Ogden Phonograph Co., 3425 Ogden Avenue, Chicago, manufacturer of talking machines and parts, has plans for new one-story plant to cost about $50,000 with equipment. Joseph Cohen & Co., 160 North La Salle Street, are architects.

Otter Tail Power Co., Fergus Falls, Minn., plans extensions and improvements in steam-operated electric power plant at Langdon, N. D., including installation of additional equipment, to cost more than $70,000, including transmission line extensions.

Cincinnati

CINCINNATI, Sept. 9.—As a result of the Labor Day holiday, fresh bookings of district manufacturers of machine tools, the past week, were slightly below the level of the preceding week. Buyers show reluctance to close for new tools until after they have seen new models to be shown at the Cleveland exposition. Inquiry, however, is in good volume and indicates a steady flow of orders for one or two machines for some time.

Contract has been let by Inland Mfg. Co., Coleman Avenue, Dayton, Ohio, manufacturer of automobile equipment and accessories, to Hillsmith Co., Dayton, for one-story addition to cost about $500,000 with equipment.

Randall Co., West Court Street, Cincinnati, manufacturer of leather-working machinery, parts, etc., has disposed of a stock issue to total $780,000, part of proceeds to be used for expansion. Company is considering removing plant to another site where increase in output will be arranged.

Liberty Range Works, Inc., Nashville, Tenn., manufacturer of stoves, ranges, etc., will erect a new plant, consisting of one-story units to total 50 x 640 ft., to cost more than $230,000 with equipment.

Hauser-Stander Tank Co., Spring Grove and Ammenn Avenues, Cincinnati, is contemplating erection of new plant, to cost about $100,000 with equipment.

Gartland, Hoswell & Rentschler Foundry Co., East Herman Avenues, Dayton, Ohio, has awarded general contract to H. R. Bragg Co., Third Street, for extensions and improvements, including new cupola, to cost about $23,000.

Stumb Motor Co., 1408 Broad Street, Nashville, Tenn., has awarded general contract to Foster & Creighton, Fourth and First Bank Building, for three-story service, repair and garage building, 102 x 170 ft., to cost about $100,000 with equipment. Warfield & Keeble, Nashville Trust Building, are architects.

Edward Koehl, Sr., Reading, Ohio, will build one-story machine shop, to cost about $22,000 with equipment.

Hartzell Industries, Inc., Piqua, Ohio, manufacturer of propellers and kindred products, has awarded general contract to V. A. Pence, Piqua, for two one-story additions, 45 x 145 ft., and 30 x 250 ft., to cost about $70,000. First-noted will be used for manufacturing, and other for storage and distributing service.

Remley Boiler & Machine Works, 263 East Short Street, Lexington, Ky., has been organized and is operating plant making small boilers and doing a general machine jobbing business.

Deveny Tool Co., Dayton, Ohio, manufacturer of tools, dies, etc., recently organized, is operating in Norwood Power Building.

Milwaukee

MILWAUKEE, Sept. 9.—Pending business and inquiries indicate a volume of business this month as large as that in early summer. Improvement in deliveries has been slight, and sales of used equipment have greatly increased to fill gaps left by delayed shipments.

Jobbing shops and tool and die makers are as busy as at any time this year. Automobile manufacture has fallen off but truck manufacture is more than fair for the season, and makers of automotive parts have not felt any decline. Demand is opening strong for agricultural implements and power production and transmission machinery.

Milwaukee Electric Railway & Light Co., Milwaukee, will soon start construction of $4,200,000 addition to Lakeside steam generating plant at Cudahy. Boiler house unit costing $1,500,000 is nearing completion, and will be six stories.

E. P. Olsen Machine & Tool Works, 1437 Main Street, Marinette, Wis., will add equipment to manufacture an electric heater for warming automobile crank cases in cold garages, invented by J. L. LaVoy, Marinette.

Milwaukee Reliance Boiler Works, 1102 Thirty-second Street, Milwaukee, will remodel a building, 35 x 95 ft., for an addition. Selzer-Ornst Co., 192 Fourth Street, Milwaukee, are contractors.

Appleton Steel Tube Co., Appleton, Wis., contemplates purchase of additional heating and piercing equipment following an increase of capital stock from $100,000 to $250,000.

Moto-Meter Garage & Equipment Co., Long Island City, N. Y., is beginning construction of several additional buildings for recently acquired plant of National Gauge & Equipment Co., LaCrosse, and will remodel existing structure.

Northwestern Motor Co., Starr Avenue, Eau Claire, Wis., has let contract for one-story foundry addition, 42 x 125 ft., to Olson & Walker Co., Eau Claire.

Conrad Monroe Gear Co., 5125 Thirty-second Street, Milwaukee, has let contract to Charles F. Monroe Construction Co., local, for machine shop to cost about $20,000 with equipment.

Board of Vocational Education, Manitowoc, Wis., has let general contracts to Kasper Construction Co., Manitowoc, for two-story addition, 46 x 84 ft., to Washington Vocational School, to cost about $117,000 without equipment. R. F. Theke is secretary of board and William J. Raeuber, Manitowoc, is in charge.

E. Brielmaier & Sons Co., 425 East Water Street, Milwaukee, architect, has plans for four-story factory, 40 x 150 ft. Owner's name is withheld.

Wisconsin Axle Co., Oshkosh, Wis., is starting erection of an addition to its machine shop department which will enlarge its floor space about 25 per cent. Building will be used to house additional machine equipment and to increase assembly facilities.

Buffalo

BUFFALO, Sept. 9.—Contract has been let by Gaylord Brothers, 155 Gifford Street, Syracuse, N. Y., manufacturers of library equipment and supplies, magazine binders, etc., to Fellows & McGrath, 207 Fellows Avenue, for one-story addition to cost about $35,000 with equipment.

Trico Products Corporation, 817 Washington Street, Buffalo, manufacturer of windshield wipers and other automobile accessories, has plans for one-story branch plant, totaling about 20,000 sq. ft. floor space at Bridgeburg, Ont., to cost about $55,000 with equipment. It is understood that company will remove present assembling plant on Courtwright Street, Bridgeburg, to new location.

Empire Air Transport Co., Loew Building, Syracuse, N. Y., has awarded general contract to O'Brien Construction Co., 104 Madison Street, for aircraft school, with shop for mechanical work, two-stories, at Syracuse municipal airport at Amboy, to cost $60,000 with equipment. Gorland Latta is one of heads of company in charge.

Joseph G. Dickerson, 169 Vestal Avenue, Binghamton, N. Y., and associates have organized Kolb, Dickerson & Smith and plan early operation of local factory to manufacture and repair electrical machinery. Philip W. Smith, 6 Westerly Way, will be an official of new company.

Bresee Chevrolet Co., 300 West Willow Street, Syracuse, N. Y., representative for Chevrolet automobile, has plans drawn for two-story service, repair and garage building, to cost about $180,000 with equipment. M. J. DeAngelis, 49 East Avenue, Rochester, N. Y., is architect.

St. Louis

ST. LOUIS, Sept. 9.—Kansas City Car Co., Tenth and Cherry Streets, North Kansas City, Mo., has acquired local plant of Deckard Steel & Iron Co., for expansion for tank car repair works. Two or more one-story buildings will be erected and additional equipment installed, to cost more than $100,000. Company is a subsidiary of American Steel Car Co., Chicago. M. R. Groenwald is general manager.

Multiplex Faucet Co., 4325 Duncan Avenue, St. Louis, has awarded general contract to Wendel Shasserre, 5973 Wells Avenue, for one-story top addition to plant, 80 x 80 ft., to cost about $30,000 with equipment. William P. McMahon, Buder Building, is architect. J. J. Fitzgibbon is treasurer.

City Council, Columbia, Mo., has awarded general contract to Simon Construction Co., Guitar Building, for addition to municipal electric light and power plant, including improvements in present unit, to cost $70,000 with equipment. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is engineer.

Missouri Boiler & Sheet Iron Works, Inc., 908 South Twenty-third Street, St. Louis, has acquired property in immediate vicinity improved with one-story building, and will remodel for expansion.

Mitchell & Mitchell Mfg. Co., Fort Smith, Ark., manufacturer of metal hospital bedsteads, springs, metal stampings, etc., will rebuild part of plant recently destroyed by fire.

National Pigment & Chemical Co., 1 Sidney Street, St. Louis, has awarded general contract to Fruin-Colnon Contracting Co., Merchants-Laclede Building, for rebuilding mechanical dryer plant, one-story, 40 x 160 ft., at Cadet, Mo., recently destroyed by fire, to cost about $45,000.

American Smelting & Refining Co., Omaha, Neb., J. A. Betterton, president, has awarded general contract to Busk Construction Co., Sunderland Building, for two-story and basement storage and distributing plant, 40 x 115 ft., to cost about $50,000 with mechanical handling and other equipment. John and Allan McDonald, Standard Oil Building, are architects.

Home Fertilizer Co., Texarkana, Ark., manufacturer of commercial fertilizers, will merge with Farmers' Fertilizer Co., Conway, Ark., under first noted name. Plans are under way for plant near Conway, one-story, to cost about $65,000 with equipment. Company is also planning establishment of at least five additional such plants in different parts of State.

Gulf States

BIRMINGHAM, Sept. 9.—Peden Iron & Steel Co., Houston, Tex., has acquired assets of E. L. Wilson Hardware Co., Beaumont, Tex., with exception of real estate, and will consolidate. Mill supply and hardware business of Wilson company will be continued by new owner, and storage and distributing plants will be maintained at Houston and Beaumont. E. G. Edson, formerly president and general manager of Wilson company, and Virgil Keith, formerly vice-president, will become identified with Peden company, of which E. A. Peden is president, and D. D. Peden, vice-president and treasurer.

Continental Gin Co., Fourth Avenue South and Forty-sixth Street, Birmingham, manufacturer of cotton-ginning machinery and parts, has asked bids for a three-story addition for storage and distribution, to cost about $100,000 with equipment.

J. W. Ross, Jacksonville, Fla., operating eight ice-manufacturing and refrigerating plants in different parts of State, is planning erection of new electrically operated plant at Lake Wales, Fla., to cost about $175,000 with machinery.

Common Council, Farmersville, Tex., has approved plans for a municipal electric light and power plant, to cost about $40,000 with equipment.

Hardicke-Etter Co., Sherman, Tex., manufacturer of cotton-ginning machinery, mill supplies, etc., has plans for a one-story addition, to cost more than $30,000 with equipment.

City Council, Lafayette, La., Wilson J. Peck, trustee of public property, will receive bids until Sept. 20 for waterworks equipment, including deep-well with pump, wash water pump, pipe line extensions, 1,500,000-gal. filter plant and other equipment. J. B. McCrary Engineering Co., Atlanta, Ga., is engineer.

City Council, Abilene, Tex., has plans for municipal airport, to include hangar, repair shops and other units, to cost $100,000 with equipment. B. Russell Shaw Co., Inc., 810 Olive Street, St. Louis, is engineer.

Atkinson & Co., Inc., 823 Perdido Street, New Orleans, has approved construction of cotton compress plant at Southport, to cost about $200,000 with presses and other equipment.

A. C. Blount, Pensacola, Fla., is at head of project to construct a paper mill in this vicinity. A fund of $40,000 is being raised to purchase 70-acre tract on Bayou Chico for plant, to cost more than $1,500,000 with equipment.

Tidal Refining Co., Houston, Tex., operated by Tide Water Oil Co., 11 Broadway, New York, has plans for new oil refinery on 700-acre tract at Ingleside, to cost more than $2,000,000 with machinery. Edward Ellsberg is chief engineer.

Agee Corporation, Dallas, Tex., C. D. Agee, president and general manager, operating Acme Screen Co., 915 South Peak Street, Dallas, and Agee Screen Co., Fort Worth, Tex., is planning establishment of several branch plants for similar production in different parts of State. Company has recently increased capital to $100,000.

Board of Education, Hamlin, Tex., is considering installation of manual training equipment in two-story high school to cost about $125,000, for which bids are being received on general contract. Voelcker & Dixon, Perkins-Snider Building, Wichita Falls, Tex., are architects.

Hydraulic Equipment Corporation, Houston, Tex., has been organized to manufacture hydraulic pumps, hydraulic brake devices and other hydraulic equipment. Company is considering having products made by outside factory on contract basis. M. A. Beurlot is secretary-treasurer.

Indiana

INDIANAPOLIS, Sept. 9.—Northwestern Terminals Co., 226 Water Street, Evansville, has plans for new coal-handling and distributing plant, to cost about $100,000 with equipment. Installation will include screens, belt-conveyors, hoppers, chutes, motors and mechanical unloaders. Vonnegut, Bohn & Mueller, Indiana Trust Building, Indianapolis, are architects.

Board of Education, Indianapolis, has authorized a bond issue of $800,000 for new Irvington High School, to include manual training department. Bids will soon be asked on general contract. Charles W. Kern is president of board.

Capehart Automatic Phonograph Co., East Pontiac Street, Fort Wayne, manufacturer of talking machines and parts, will soon take bids for one-story addition, to cost about $35,000 with equipment. Charles R. Weatherhogg, 250 West Wayne Street, is architect.

City Airport Commission, Terre Haute, headed by Robert Prox and Dr. F. H. Jett, is arranging bond issue of $125,000 for municipal airport at Dresser field, which is to be purchased for such purpose. Plans will soon be drawn for hangars, repair shops, oil storage and other field units.

Tokheim Oil Tank & Pump Co., 1602

Wabash Avenue, Fort Wayne, Ind., manufacturer of gasoline pumps and equipment, has awarded general contract to Rump-Kintz Co., Medical Arts Building, for one-story addition, to cost about $100,000 with equipment. Pohlmeyer & Pohlmeyer, Central Building, are architects.

Removal of Columbia Metal Products Co. from Chicago to La Porte, following its purchase by Great Western Mfg. Co. of latter city, is being completed.

Madison Machine Co., Madison, has recently been taken over by William E. Clark.

Plant of Davis Foundry Co., Newcastle, recently damaged by fire with loss of $60,000, will be rebuilt and new equipment installed.

Canada

TORONTO, Sept. 9.—Machine tool sales developed more strength the past week and the interest shown by buyers indicates more extensive purchases. Small lists are appearing for replacement needs from automotive and railroad companies. Single tool buying is active and builders and dealers report a steady flow of orders.

Dominion Wheel & Foundry Co., Toronto, has applied for a permit to build a $60,000 machine shop. Company is erecting a large foundry.

General Motors Corporation of Canada, Oshawa, Ont., has awarded general contract to W. J. Trick Co. for an addition to McKinnon Industries plant at St. Catharines, Ont., to cost $175,000. Building, on which construction started Sept. 5, will be 136 x 425 ft., and is expected to be completed within 60 days. Plant will be used exclusively for manufacture of Delco-Remy starting and lighting equipment.

Superior Alloys, Ltd., has leased a site from Algoma Steel Corporation, Sault Ste. Marie, Ont., for erection of a plant to cost $75,000.

Steel Co. of Canada, Ltd., 525 Dominion Street, Lachine, Que., is receiving bids, no closing date set, for erection of an addition.

Western Canada

Plans are under way for rebuilding sodium sulphate plant of Bishopric & Lent Co., Cincinnati, at Mossbank, Sask., recently destroyed by fire.

Work will be started early next spring on improvements to Fort Rouge yards of Canadian National Railways at Winnipeg, Man. Plans call for new shops, roundhouse and extension of yards, to cost between $3,000,000 and $4,000,000.

Barry Sheet Metals Works, 10171 Seventeenth Avenue, Calgary, Alberta, has let contract to J. J. Doyle for an addition.

Pacific Coast

SAN FRANCISCO, Sept. 5.—Bids will be asked at once by S. & W. Lawn Sprinkler Co., 2308 West Washington Street, Los Angeles, for one-story addition, to cost about $24,000 with equipment. Edward L. DiVall Co., 3406 West Washington Street, is architect.

Pickwick Corporation, Los Angeles, has work under way on a new plant in El Segundo district for manufacture of automobile buses, known as nitecoaches, used by its subsidiary, Nitecoach Co., including departments for parts production and assembling, to cost $150,000 with equipment.

Board of Education, Long Beach, Cal., has authorized purchase of 67 lots in Willow Park district as site for new senior and junior vocational high school, to cost more than $500,000 with equipment.

Universal Engineering Co., Los Angeles, manufacturer of mechanical specialties, has plans by Austin Co. for one-story addition to plant at 2369 East Fifty-first Street, to cost about $30,000 with equipment.

United States Metal Products Co., 330 Tenth Street, San Francisco, will erect a new one and two-story plant, 200 x 380 ft., to cost about $120,000 with equipment. Ellison & Russell, Pacific Building, are architects and engineers.

Port of Portland Commission, Spalding Building, Portland, will soon begin construction of two hangars at Swan Island airport, with machine and repair shop facilities, to cost more than $90,000 with equipment. Other field structures will also be erected. James H. Polhemus is manager.

Willapa Pulp & Paper Mills, Inc., Pacific Building, Portland, is contemplating construction of a new mill near present works at South Bend, Wash., to cost more than $1,000,000 with equipment.

Aircraft Plywood, Inc., First National Bank Building, Seattle, will soon break ground for new one-story plant, 60 x 560 ft., to manufacture aircraft specialties, for which general contract recently was let to Austin Co. A steam power plant also will be built. Entire project will cost about $125,000 with equipment.

Allison Steel Mfg. Co., Phoenix, Ariz., is planning erection of a one-story plant to cost over $125,000 with equipment.

Foreign

OFFICIALS of Bucyrus-Erie Co., South Milwaukee, Wis., manufacturer of excavating and other construction machinery, and Ruston & Hornsby, Ltd., Lincoln, England, manufacturer of oil engines and kindred equipment, have organized Ruston-Bucyrus, Ltd., to establish a plant in England for manufacture of excavating machinery, etc. It is understood that works will be ready for production by close of year.

Southwestern Power Co., a subsidiary of Mexican Light & Power Co., Gante Street, Mexico City, is completing construction of power dam on Lerma River, near Tepuxtepec, State of Michoacan, to impound 500,000,000 cu. meters of water for hydroelectric power service. Work will proceed on initial power station to develop a capacity of 60,000 hp. Later another unit will be installed to increase output to 90,000 hp. Project will include construction of transmission lines and is part of proposed hydroelectric power development of company, for which an appropriation of about 20,000,000 pesos (approximately $10,000,000) has been made. Headquarters of parent organization are at 357 Bay Street, Toronto, Ont.

Government of Mexico, Mexico City, has concluded arrangements with Mexican Aviation Commission for central airport for city, to include construction of metal hangar, 120 x 120 ft., repair and reconditioning shop, 20 x 120 ft., and other field units, to cost 400,000 pesos (about $200,000).

Goodyear Tire & Rubber Co., Akron, Ohio, is arranging for purchase of site in Argentina for plant to manufacture automobile tires, tubes and other rubber goods, initial unit to cost more than $400,000. P. W. Litchfield, president, has left for trip to South America to arrange for project.

New Trade Publications

Tools for Hardware and Marine Trades. Leetonia Tool Co., Leetonia, Ohio. Catalog No. 928 consists of 18 pages describing the company's tools manufactured for the hardware and marine trades. On the last page is a comprehensive index of products.

Centrifugal Pump. Duriron Co., Inc., Dayton, Ohio. Duriron centrifugal pump No. 614 is described in bulletin No. 153, which shows the assembly drawing and gives a list of parts. The last page is devoted to reproductions of three rating charts telling of the performance of the pumps.

Oil Circuit Breakers. Westinghouse Electric & Mfg. Co., East Pittsburgh. A new four-page booklet describes types F-24 and F-24-R oil circuit breakers for medium interrupting capacity usage. Different methods of mounting the breakers and their construction are outlined. Tables are provided covering the closing and tripping currents for solenoid and motor mechanism, interrupting capacities, shipping weights, mounting details and the various accessories and attachments.

Electric, Oil and Salt Baths. Despatch Oven Co., Minneapolis, Minn. A bulletin featuring a new line of electric, oil and salt baths.

Alloy Cast Iron.—International Nickel Co., New York: Bulletins No. 201-a and No. 207, which are both illustrated, are entitled "An Introduction to Nickel Cast Iron" and "Properties and Applications of Nickel and Nickel-Chromium Cast Iron," respectively. The first is a leaflet of four pages and the second, one of 12. The former discusses the metallurgy of the production of nickel cast iron and the second treats of the applications of this alloy product in the aeronautical, the automotive, the general machinery and the machine tool industries, as well as their use in power plants by railroads and general users.

Electric Furnaces.—Hevi Duty Electric Co., Milwaukee. Bulletin 629, of four pages, illustrated, is entitled "The Electric Furnace in St. Louis." It describes some installations in various plants in that city.

Alloy Steel.—Joseph T. Ryerson & Son, Inc., Chicago. A four-page illustrated bulletin, entitled "Nikrome," describes a heat-treated alloy steel of guaranteed physical properties. It is said to be especially suited for the more difficult and heavy-duty industrial uses, particularly by such companies as do not maintain a heat-treating department of their own because this product comes already heat-treated to guaranteed physical properties.

Steel Castings.—Sivyer Steel Casting Co., Milwaukee. Bulletin No. 11 of four pages, illustrated, describes "New Economics of Buying Castings." It discusses in particular a sand mill pinion made of Sivyer chrome-nickel steel, and an Ingersoll milling machine in which Sivyer alloy and special carbon steel castings are incorporated.

CARNEGIE LIBRARY OF ATLANTA

THE IRON AGE

New York, September 19, 1929

ESTABLISHED 1855 VOL. 124, No.12

Variety No Bar to Mass Production

Flexibility of Operations Enables Waukesha Motor Co. to Make Many Types of Gas Engines at Prices Reflecting Quantity Output

"HENRY FORD is properly recognized as the world's greatest manufacturer. By making his overhead carry a tremendous volume of output, he has outdistanced all rivals in reducing unit costs," said Harry L. Horning, president and general manager of the Waukesha Motor Co., Waukesha, Wis., when interviewed by a representative of THE IRON AGE.

"Yet it is equally true that other manufacturers are performing certain operations more efficiently. This fact is not altered by a comparison of costs, since a much larger volume of repetitive work still throws the advantage in Ford's favor.

"The principle of making a given overhead carry a maximum amount of production, developed in such an impressive manner in the automobile field, is a standing challenge to all American manufacturers. It is not surprising that some industrial executives have succeeded in making up, in part, for restricted volume by developing more efficient methods of doing specific things.

"Every manufacturer now realizes the importance of volume to cost reduction and the equal importance, paradoxical as it may seem, of cost reduction as a prerequisite to greater volume. He is also well aware that the difficulties of obtaining an economical operation increase in direct proportion to the variety of products he makes. The greatest problem of the Waukesha Motor Co. is to achieve a flexibility that will permit it to serve many different classes of customers with numerous types of gas engines in small and large quantities—and at a price that reflects mass production.

"That we have succeeded in a measure is indicated by the fact that in our busiest season we are able to deliver within two days to six weeks after the receipt of an order for a specialized product. While we build 30 different models of engines and the specifications of our customers may call for numerous accessories and adaptations to meet their particular requirements, there is a sufficiently even flow of business in certain types of motors to permit the scheduling of 35 to 45 per cent of our production three to four months in advance. Around this nucleus the rest of our manufacturing program is built as actual orders are received.

"The nature of our business does not permit us to duplicate the automobile industry's straight-line flow of materials, with assembly of parts at fixed time intervals in step with continuous conveyors. Our scheme of assembling engines is designed to give us the best possible results considering the variety of models we make. Our

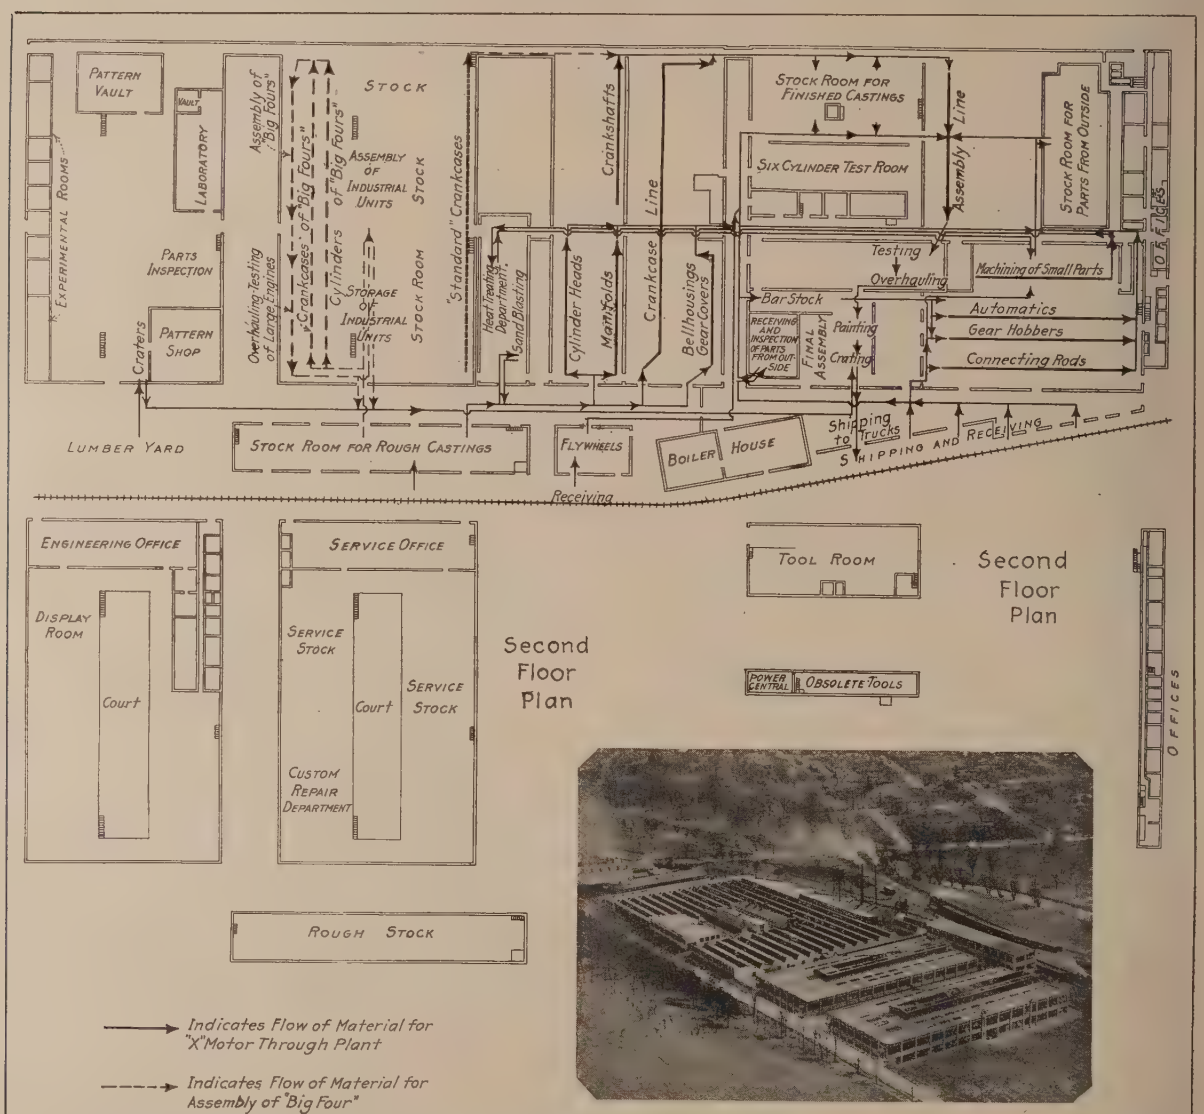
HARRY L. HORNING has long been a leading figure in the automotive industry. He was elected first vice-president of the Society of Automotive Engineers at the 1921 annual meeting, and in 1925 was elected president. He has also been president of the Motor and Accessory Manufacturers Association, serving in 1926 and 1927. During the war he was chairman of the automotive production section of the War Industries Board. Mr. Horning's first business connection, after attending Carroll College, Waukesha, Wis., was in the chemical laboratory and operating department of the Milwaukee Gas Light Co. in 1901. Later he spent two years in the steam engineering department of the Crane Co. From 1904 to 1906 he was head of the mechanical engineering department of the Modern Structural Steel Co., Waukesha. In 1906 he established the Waukesha Motor Co.

operations are departmentalized both as to parts and size of completed product.

"One end of the plant is devoted to building engines of more than 70 hp. Here four-cylinder engines ranging from 80 to 120 hp. are produced in uninterrupted progression, from the machining, drilling and honing of parts to their assembly into completed units, and six-cylinder

ping room. This method has been found most efficient and flexible for handling the varying requirements of our trade.

"Just as we have had to work out our own problems as to the flow of work, we have likewise had to develop our own methods of handling materials. The pieces going into our engines are heavier than the ordinary automotive



PLAN and Airplane View of Waukesha Motor Co. Plant. To obtain a flexibility in operation that will permit it to produce 30 different models of gas engines at prices that reflect mass production, the company has departmentalized its operations both as to parts and size of completed product. In building smaller engines, of which "X" motor is typical, the flow of material makes a complete circle from the unloading platforms through the various departments to the shipping room. On the other hand, a straight-line flow of materials characterizes the building of the "Big Four," one of the larger models

motors ranging from 200 to 300 hp. are built up individually on a single assembly stand.

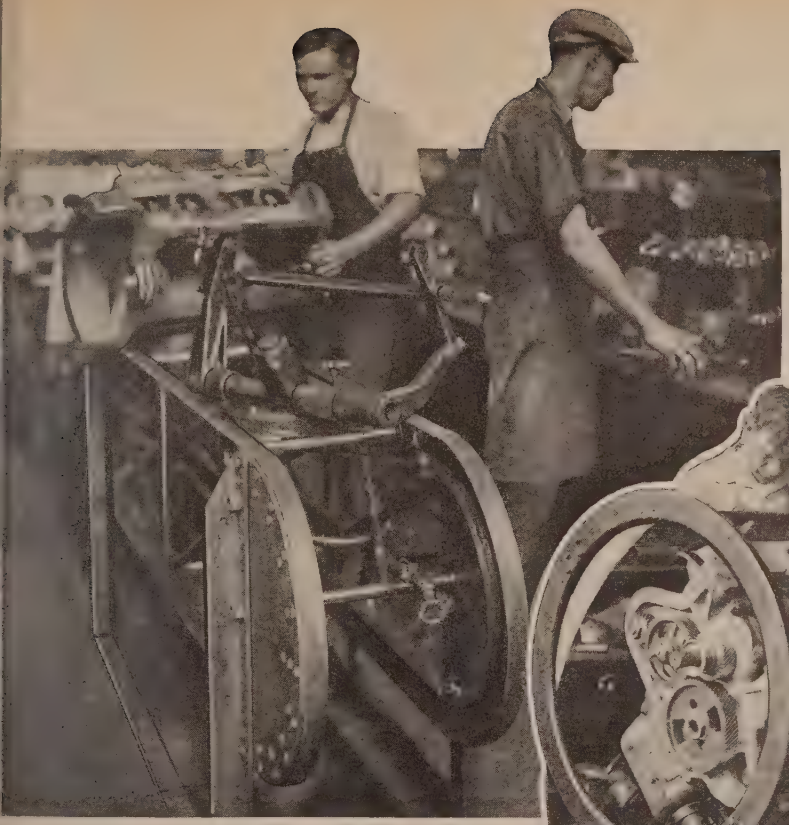
Flow of Work Makes Complete Circle

"The other end of the works is devoted to building engines of less than 70 hp. In this section of the plant there are separate departments for the machine work on different parts. The flow of material makes a complete circle from the unloading platforms through the various machine shops and back through the assembly department, testing department, painting room and shipping room. This method has been found most efficient and flexible for handling the varying requirements of our trade.

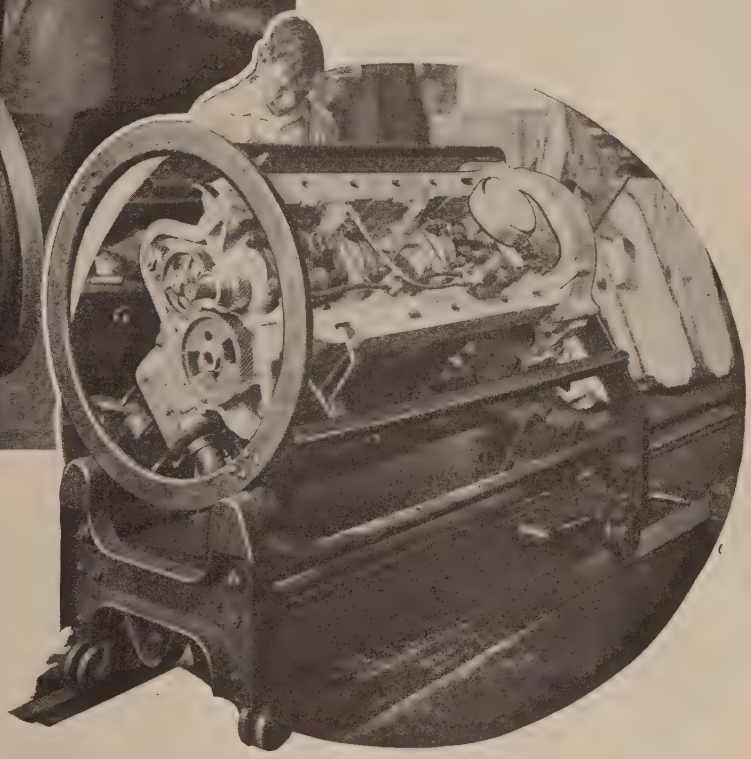
"Just as we have had to work out our own problems as to the flow of work, we have likewise had to develop our own methods of handling materials. The pieces going into our engines are heavier than the ordinary automotive sizes and are difficult to handle in a mass production way. We have made it a point, therefore, to relieve the workman of lifting wherever possible. We are convinced that the greatest opportunity for further economy lies in reducing the time of putting a piece in a machine and taking it out.

Material Handling Problem Given Special Study

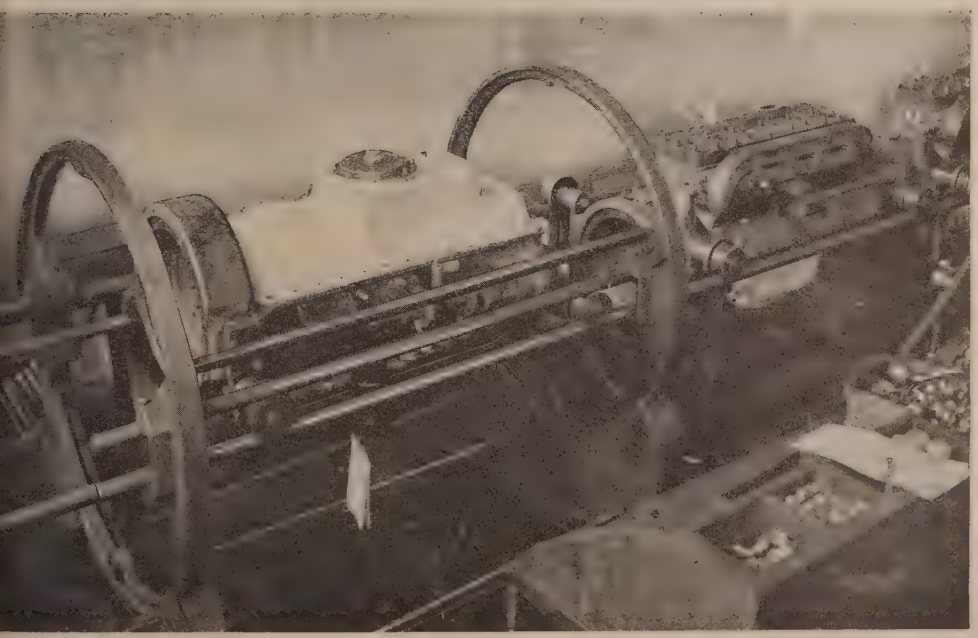
"We have not adopted any one method of handling materials. Each operation is studied by itself and the most suitable device is provided. The plant is equipped with



THE Smallest Motors Are Assembled on Carriages Running on a Continuous Track (Left). The working frame of the carriage is hinged and swiveled to allow movement 180 deg. through a vertical arc and 360 deg. through a horizontal circle



FOR Assembling Larger Engines a Portable Rollover Frame (Right) Is Used. The crankcase casting with its flywheel housing is the first part to be attached to the rollover. Others are added as the frame is moved along the assembly line, the rollover being rotated as required



ENGINES of Intermediate Weight Are Assembled on Carriages Running on Tracks Waist High (Left). Where it is necessary to turn the work over, rollover stations like the one shown are provided

gasoline and storage battery trucks of the lift type, overhead electric and hand-operated traveling cranes, monorail systems, pneumatic and electric hoists, chain blocks and gravity roller conveyors. For our assembly departments we use conveying equipment of our own design, adapted to our particular needs.

"While study of material handling is important to cost reduction, the maintenance of uniform quality in our product is also highly essential, both as a means of holding and of expanding our markets. Each step in operations is followed by an inspection, and there is a final general inspection before shipment is made. Nine per cent of all the labor in the plant is employed in inspection.

"All engines, after assembly, are tested, overhauled, reassembled and final-tested. Four-cylinder motors are run on their own power for 6 to 10 hr. Six-cylinder engines, as well as the larger four-cylinder units when requested, are given horsepower rating tests on dynamometers or testing fans. The plant is equipped with 14 laboratory-type cradle dynamometers.

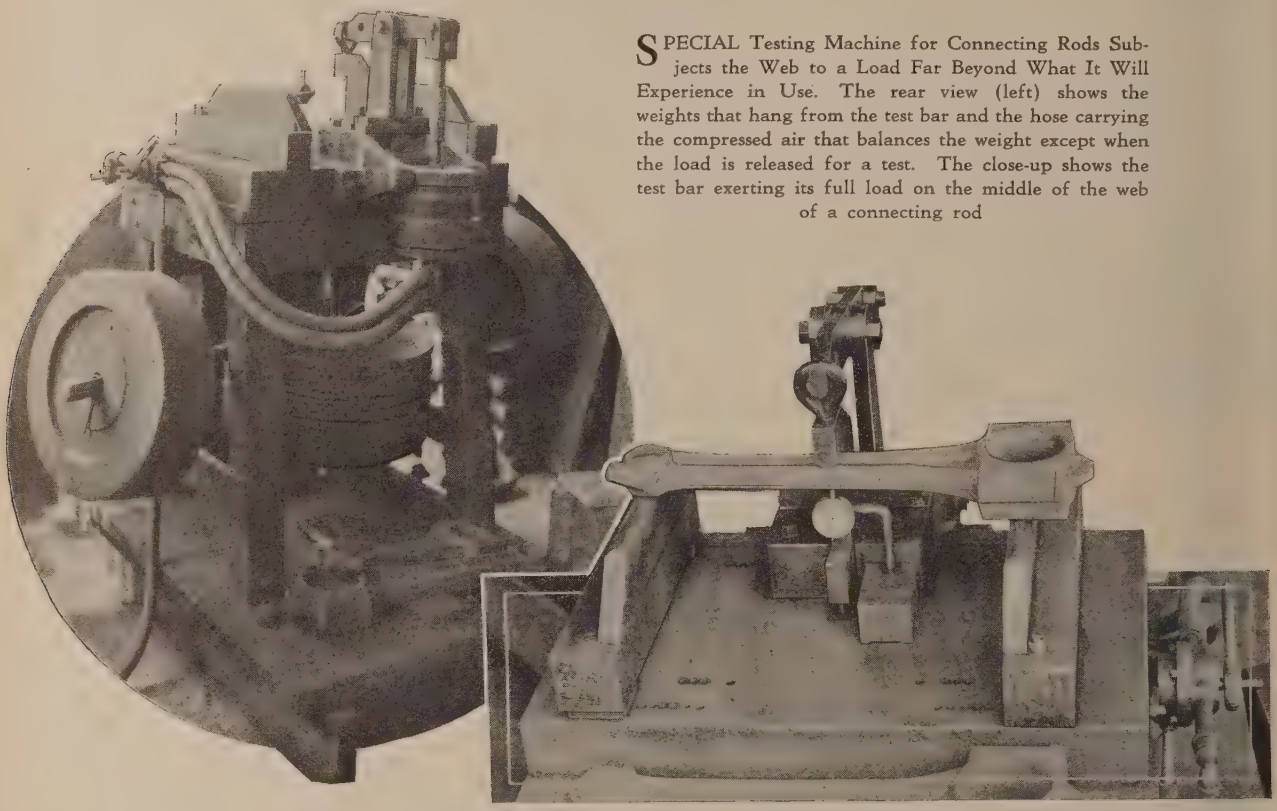
"Testing, overhauling, material handling, flow of work and scheduling of orders do not tell the whole story in this highly competitive era. Organized research is also necessary to develop new methods and new products. The Waukesha Motor Co. has an engineering department with a personnel of 57, one-third of whom devote all of their time to research. Our engineers, in cooperation with the United States Bureau of Standards, the Petroleum Institute and the Society of Automotive Engineers, have designed and built a gas engine for testing and measuring the knocks developed by different kinds of fuel.

"One of our most important undertakings, now in an experimental stage, is the development of a Diesel engine of one-half the customary weight, which now runs from 60 to 70 lb. per horsepower.

"In our efforts to improve our manufacturing methods and to better our products, we recognize the need for keeping in close touch with developments throughout the field of industry both here and abroad. An excellent means to that end is our library, in which we keep 59 technical and trade magazines, including THE IRON AGE and English and Continental periodicals. As an indication of how strenuously these papers are used, we have frequently put improvements into practice within one week after the receipt of the publications from which the ideas were obtained.

"We also have a circulating library of 1143 volumes of technical reference books."

The Waukesha Motor Co., of which Mr. Horning has been president since its founding in 1906, originally made automobile motors. Subsequently it went into the production of truck engines and then industrial engines. Today it is one of the largest makers of industrial automotive-type gas engines in the world, making 70,000 motors a year.



SPECIAL Testing Machine for Connecting Rods Subjects the Web to a Load Far Beyond What It Will Experience in Use. The rear view (left) shows the weights that hang from the test bar and the hose carrying the compressed air that balances the weight except when the load is released for a test. The close-up shows the test bar exerting its full load on the middle of the web of a connecting rod

In terms of value 50 per cent of its output goes into motor trucks, buses and other large units, such as engines for gas-electric railroad coaches. Another 10 per cent is in gas engines for the oil fields, both in this and foreign countries. The remainder is in motors for a wide range of industrial uses.

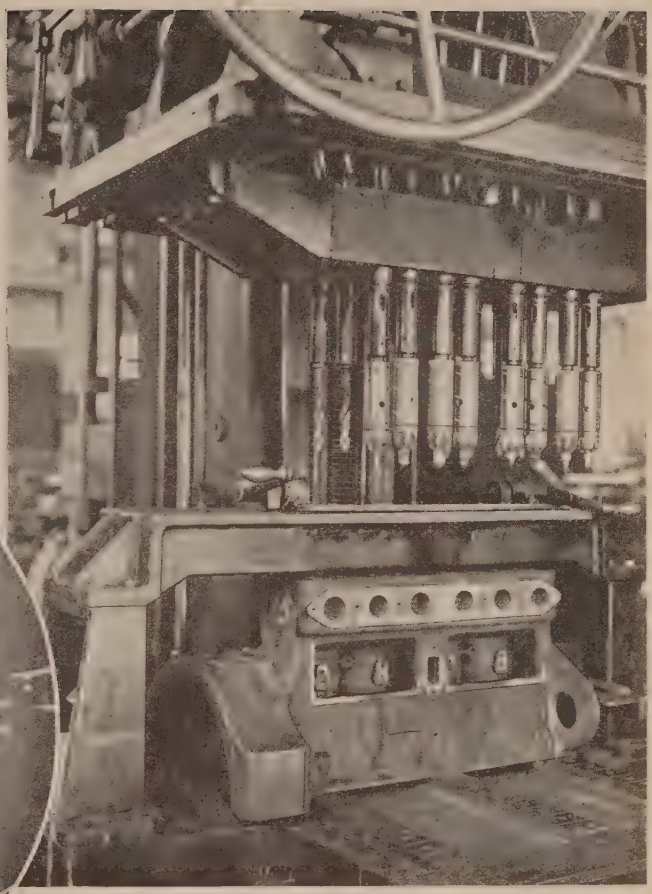
The company uses 25,000 tons of alloy gray iron castings annually, representing 25 per cent of the value of its product. Another 12 per cent is accounted for by steel forgings, and a large quantity of steel stampings is used. No malleable or steel castings are employed, however.

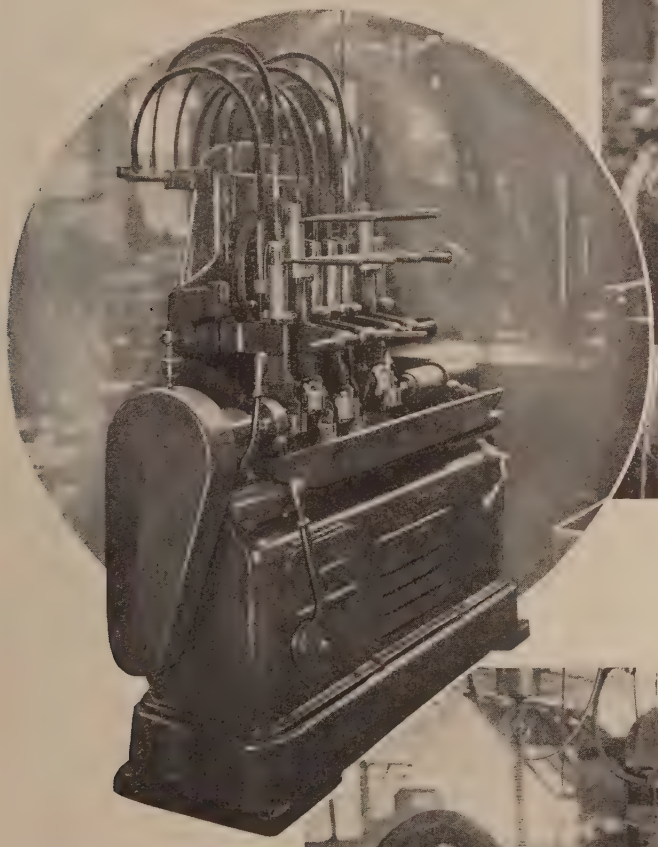
Heat treating, done in gas furnaces, constitutes an important stage of the manufacturing operations. From 5000 to 7000 pieces are heat treated daily.

Special Testing Machine Devised for Connecting Rods

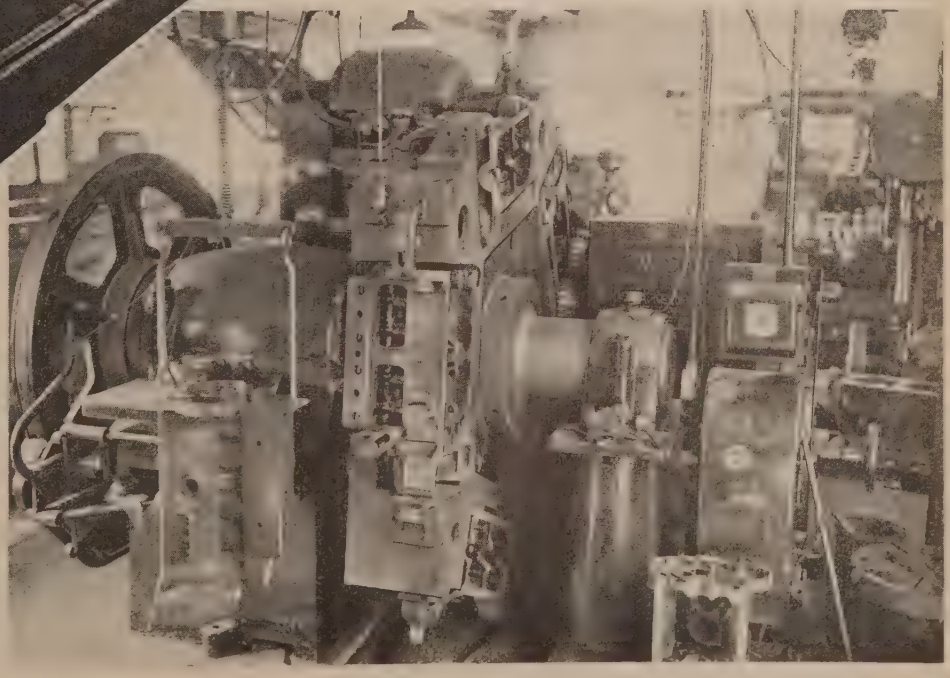
Important pieces are tested after heat treating. Satisfactory equipment for testing connecting rods was lacking; so the company devised its own. It had been found that testing the large end of the rod for hardness was no sure index of the strength of the web, frequently failing

THE Main and Throw Bearings of Crankshafts Are Simultaneously Honed in an Automatic Machine Built by A. P. Schraner & Co., Cleveland. Each honing head has six carborundum stones, and each bearing is continuously flushed with kerosene during operation. The crankshaft is driven by a lug in the headstock spindle, the lug being engaged by the headstock handle. The front end of the shaft is carried by a quick-acting tailstock with a live center. The platen in which head and tailstocks are mounted is given a reciprocating motion of ⅛ in., moving the shaft laterally as it rotates and thereby facilitating honing. To permit this the stones are ⅛ in. shorter than the length of the bearings. When the machine stops the throwheads are clamped in the position they are left by the shaft. The operator then opens the heads by turning a handwheel, lifting the entire head assembly, which is carried by a slide, away from the shaft. The same handwheel lowers the heads over the next crankshaft. The time of operation is about 3½ min. floor to floor





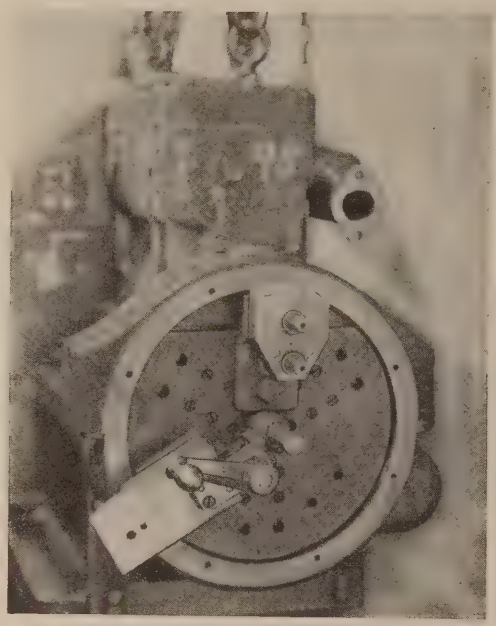
CLUSTER Plates (above) Drilled for Specific Operations Conserve Time. Accurate alinement of the drills is assured by the holes in the plate. Adjustable screw bushings in the holes permit the tools to be accurately set for depth



EQUIPMENT Includes Production Tools of the Largest Type Used in Automotive Plants, Such as the Continuous No. 3 Davis Milling Machine (Right) Built by the Davis & Thompson Co., Milwaukee. The machine weighs 28,000 lb. and its rotating drum carries five cylinder blocks. It takes 16-in. face mills and is capable of feeding 20 in. a minute past the cutters. As in the case of all other heavy equipment, special attention has been given to material handling. Cylinder blocks are suspended from air hoists by springs, so that they may be loaded on to the drum without requiring precise adjustment through the pendant control

to disclose flaws or cracks not discovered under inspection. A machine was therefore developed which subjects the web to a load far beyond what it will experience in use.

The ends of the connecting rod are placed on V-blocks, with the middle of the web suspended underneath a notched bar to which given weights are attached. Compressed air is used to balance this weight, keeping the testing bar free from the web of the connecting rod while it is being placed preparatory to the test. By means of a valve on the side of the machine the air pressure is exhausted and the testing bar is dropped on the connecting rod. The rod shown in the illustration, resting on 18-in. centers, is being subjected to a load of 1100 lb. The deflection permissible is 0.08 in., with a return to zero after the load is lifted. A D. C. Ames dial indicator is used to measure the deflection. All connecting rods are given this kind of test, and failures have been practically eliminated.



USING the Crankshaft as a Spindle with Drive by a 1-Hp. Motor, and Using the Flywheel as a Tool Holder, the Circle of the Flywheel Housing Is Bored and the Flange Is Faced. This rectifies any slight misplacement of the crankshaft as a result of the insertion and scraping of bearings

Different Types of Equipment Used in Assembly Lines

Equipment used in assembling varies according to the size of the engines made. For the larger engines, exclusive of those built on a stationary stand, a portable rollover frame is used. The crankcase casting with its flywheel housing is first attached to the assembly rollover and then the frame is rolled forward and crankshaft, camshaft and cylinder blocks, with valves, are added. Later timing gears and flywheel are fitted in. Subsequently pistons and rods, timing gear cover, manifold, cylinder heads, water pump and final trimmings are put on. The rollover permits the workman to turn the work completely over so that he can operate without stooping, stretching or straining. The rollover frame is supported on casters. These run on tracks in the assembly line, but can be operated on ordinary floor surface likewise.

Engines of intermediate weight are assembled on carriages running on tracks waist high extending the length of the assembly line. The carriages are equipped with flanged wheels which fit the cold-rolled rounds that serve as the tracks. At different points in the line, where it is necessary to turn the work over, rollover stations have been provided. These consist of concave supporting bearings for the hoop-like frame ends, which are connected on opposite sides by double tracks of steel rounds. When the work is in the frame the carriage wheels rest between the tracks. Either track can be made to coincide with the adjoining stationary tracks by rolling the frame.

The smallest motors are assembled on a continuous track—the carriages passing from one end to the other and then being returned underneath to the beginning of the line. The working frame is hinged to permit movement 180 deg. through a vertical arc and is swiveled on the carriage to allow movement 360 deg. through a horizontal circle. Bolts, nuts, gears and other small parts and fittings are distributed every morning in the benches in front of the assembly line by a stock boy. Whenever a work order is issued the proper number of parts for a day's operations are requisitioned from the stock room.

The three different types of assembly equipment are covered by Waukesha Motor Co. patents.

Squaring Up Flange of Flywheel Housing with Crankshaft

The final operation in the assembly of the smaller motors is an ingenious one. The insertion and scraping of bearings in the crankcase sometimes throws the crankshaft slightly out of square with the flange of the flywheel housing. To rectify such a condition the crankshaft is used as a spindle, being driven through reduction gears from a 1-hp. motor, and the flywheel is used as a tool holder. As the flywheel rotates the flange is faced and the flywheel housing circle is bored. An operator feeds the tools manually through bevel gears operated by a handle.

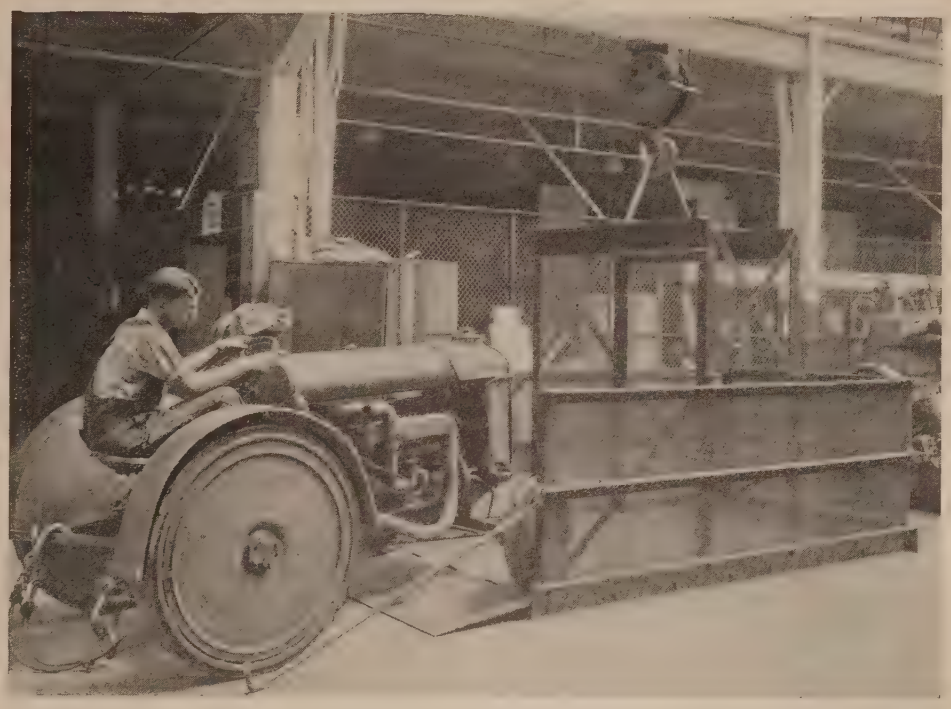
The machining of parts going into Waukesha engines is on a highly developed production basis. For example, five engine block castings are milled in one set-up on a rotary No. 3 Davis milling machine, the work rotating past the milling cutters. Similarly, multiple boring machines are used to bore the cylinder chambers of an engine block simultaneously. Other notable equipment includes a bank of three two-way multiple tapping machines and a bank of three two-way multiple drilling machines.

Cluster Plates Cut Down Set-Up Time

For other multiple drilling operations cluster plates, designed by A. Herzberg, factory superintendent, are used on standard upright multiple drilling machines. Accurate alinement of the tools for particular operations is insured by the holes in the cluster plate. By means of screw bushings in the holes, adjustable by screw driver, the tools are accurately set for depth. An ordinary set-up on a multiple drill formerly took 3 to 8 hr. Now it takes 20 min. to 1 hr. Moreover, the bushings and jigs are virtually everlasting. In the illustration the set-up is for boring and reaming for bushings for the engine valves and then drilling the valve stem guide holes. All machine work is done to very close limits.

Another multiple production operation that is outstanding is the honing of crankshafts. For this purpose a machine built by A. P. Schraner & Co., Cleveland, is used. The bearings and throws of the shaft are honed simultaneously. The honing heads are adjustable vertically and horizontally and need only be set once for a given size of crankshaft. The honing heads reciprocate with the throws of the shaft. Honing is by flat carburundum stones, the surfaces of which are at right angles to the radius of the bearing. Both crankshafts and flywheels are balanced both dynamically and statically.

An addition to the plant, increasing the area 50 per cent, was completed in May this year. The present di-



A CRANE Basket Has Been Provided for Hoisting Industrial Truckloads of Material from Main Floor to Service Stockroom on Balcony

mensions are 400 x 1400 ft. The older part of the plant is of saw-tooth roof construction. The addition consists of two monitor-type buildings, with central bays extending to the roof and balconies located on each side.

The balcony floor of one of these buildings is occupied by a custom repair shop and replacement parts department. Here replacement parts are got ready for shipment and engines of clients are reconditioned. This department now accounts for 10 per cent of the company's business. On the main floor of the central bay is the completed unit department. Here engines requiring special transmission, special mounting or specialized trucks are assembled for shipment. This class of business also represents 10 per cent of the company's total.

The bay of this building, as well as the other monitor-type structure, is served by a 5-ton overhead electric traveling crane. To facilitate the movement of small parts from the central bay to the balcony a crane basket is used, the crane hook attaching to an eye on top of the basket. Trucks run on to the basket on the main floor are run off on projections under the crane runway from the balconies.

The second monitor-type building is devoted to engineering and experimental purposes, and also contains a pattern shop. All of the buildings are connected on the side opposite the receiving and shipping platform by a wide aisle, facilitating communication between departments by gasoline and storage battery trucks.

The shipping and receiving side is served by tracks from the Chicago, Milwaukee, St. Paul & Pacific and Chicago & North Western railroads.

The Waukesha Motor Co., under normal operations, employs 1800 people, all but 200 of whom are engaged in production.

Utility of Cadmium Rapidly Expanding

PRACTICALLY all of the world's production of cadmium comes from the treatment of the impure zinc solutions used for preparing electrolytic zinc, so that the potential output of cadmium bears a very direct relation to the amount of electrolytic zinc produced, writes C. P. Linville in "Mineral Industry, 1928." In 1928 there was a greatly increased production; prices also increased to 85 to 90c. a pound.

There are four uses recently developed which account for the rapidly increasing demand for cadmium. It is being used in increasing amounts in making cadmium solders. The Udylite process is a rust-proofing process, in which iron articles such as locks, small hardware, and automobile parts are electroplated with the metal, after which the work is heated in an oven for several hours at a temperature of from 150 to 200 deg. C.

The Cadalyte process, which is an electroplating process giving a bright silver-like finish, is also being extensively used. Cadmium plating is also used in connection with chromium plating, the work being first given a cadmium coat, then the final chromium plate.

A small amount added to silver alloys makes the silver whiter and more resistant to tarnish. Cadmium has also other uses in jewelry, giving with gold a green alloy. When added to aluminum which is to be used in making powder it improves the color and luster of the powder and makes it more resistant to corrosion.

Cadmium still continues to be extensively used in making fusible alloys. When added in small amounts to copper, the wire drawn from the alloy has greater strength for use in transmission lines without having its conductivity appreciably reduced.

Record Speed Made in Steel Erection

Steel Framework of Bank of Manhattan Building, 71 Stories, Will Be Completed in Less Than Four Months—Special Drilling Equipment Expedites Fabrication

The New Bank of Manhattan Building, 71 Stories, Will Top the 792 Ft. of the Woolworth Building by More Than 100 Ft. and Will Be 11 Floors Higher

FOR speed of steel fabrication and erection, the 71-story Bank of Manhattan Building, now in course of construction at 40 Wall Street, New York, probably will break all known records.

Although the first slabs for column supports were not delivered on the ground until the third week of June, the final piece of steel in the tower will have been set in place and the last rivet will have been driven by Oct. 15, or within a few days of that date.

So far as known, no steel frame of this size has ever before been completed in so short a time—less than four months—even in New York, where high ground values and idle investment make speed more of an essential than in less crowded communities.

When the decision was reached by the Bank of the Manhattan Co. and the Starrett Corporation to build the tallest building in the world, it was realized that fast work would have to be done to complete the structure in time for occupancy on May 1, 1930, May Day being the customary moving day for New York business, all leases expiring on that date.

Coordination of Work Made Record Possible

That the building will be completed within schedule time, probably eclipsing by several months any construction record achieved in the United States for so large a structure, will be due, it is stated, to the complete coordination of all who were factors in its construction—the architects, engineers, owners, contractors and the steel fabricator.

Speed being an essential part of the building program, there was no waiting for finished plans before work was begun. The foundations were started, in fact, before the work of demolishing the old buildings had been completed. Demolition was rushed by three shifts of workmen.

Ordinarily, an architect has his plans prepared three or four months before a building is started, but in this case architects, engineers and contractors all started at about the same time, and plans were so dovetailed that the building has gone up floor by floor without a serious hitch.

As rapidly as Craig Severance, architect, and Yasuo Matsui, consulting architect, could prepare preliminary plans, Starrett Brothers, the general contractors, let the sub-contracts. The contract for the steel was placed with the Levering & Garrigues Co., New York, whose fabricating plant is at Dunellen, N. J. This contract was unusual, even apart from the time element involved for the completion of the work, in that it gave to the steel fabricator the engineering work and detailing in connection with the job, as well as the fabrication and erection. The steel totaled more than 17,000 tons.

Steel Deliveries Anticipated Contract Requirement

This contract was received by the Levering & Garrigues Co. on March 20, this year, and it provided that the first steel should be on the ground not later than June 26 and the last steel by Oct. 15. The initial delivery of steel anticipated the contract date by several days.

An example of the speed attained is that only six weeks elapsed from the time the steel contract was let to the completion of the detail plans from which the steel could be ordered from the mill for fabrication.

Favored by weather almost devoid of rain, the fabricator has been able to keep ahead of schedule, sometimes by three or four days.

To accomplish this record, the Levering & Garrigues Co. augmented its own organization with that of the structural engineering firm of Purdy & Henderson, New York, who handled much of the steel planning. In the production work it obtained the cooperation of the Bethlehem Steel Corporation, which devoted its fabricating shops to the initial part of the structural work in addition to providing definite rolling schedules for the plain material that would fit in closely with actual requirements of the shops.

Steel Work Half Done Before Foundations Were Completed

It has been possible for the steel erection to go ahead at an unusually fast pace partly because of the fact that the erection of the framework was started before the foundation work had been completed. Temporary foundations were put in to save time, and as the steel work progressed the permanent foundations were built. The steel work was about half erected, however, before the foundation work was all done.

How this has worked out as a time-saver is shown by the fact that foundation work is still in progress and no steel erection has been started on a building of comparable size in the downtown New York district, although the contract for the latter structure was let at about the same time as that for the Bank of Manhattan Building.

The steel work on the bottom floors of the Bank of Manhattan Building was in progress long before the steel design for the upper floors had been finished. The steel designing and detailing went along with the architectural development. This helped the fabricator to rush the steel erection, there being no waiting for the complete steel design before proceeding, as is the case with most steel structures.

Column Slabs of Unusual Size Used

The design of the bank building, from a structural steel standpoint, does not differ materially from that of other tower buildings. However, the heavy load that is to be carried called for extremely rugged construction,

which began with the slabs under the tower column. These slabs are said to be the largest ever used in a building of this type. The largest were 14 in. thick, 84 in. wide and 7 ft. 10 in. long, weighing 31,000 lb. each. They were rolled on the large plate mill of the Lukens Steel Co., Coatesville, Pa.

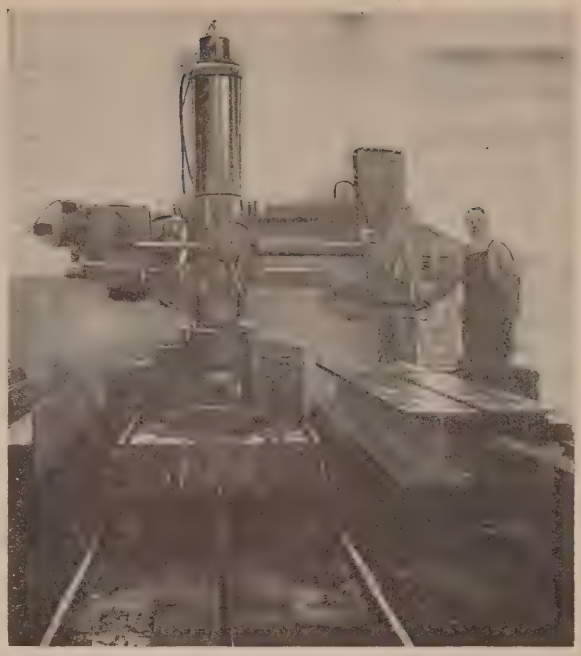
Special Drilling Equipment Speeds Fabrication

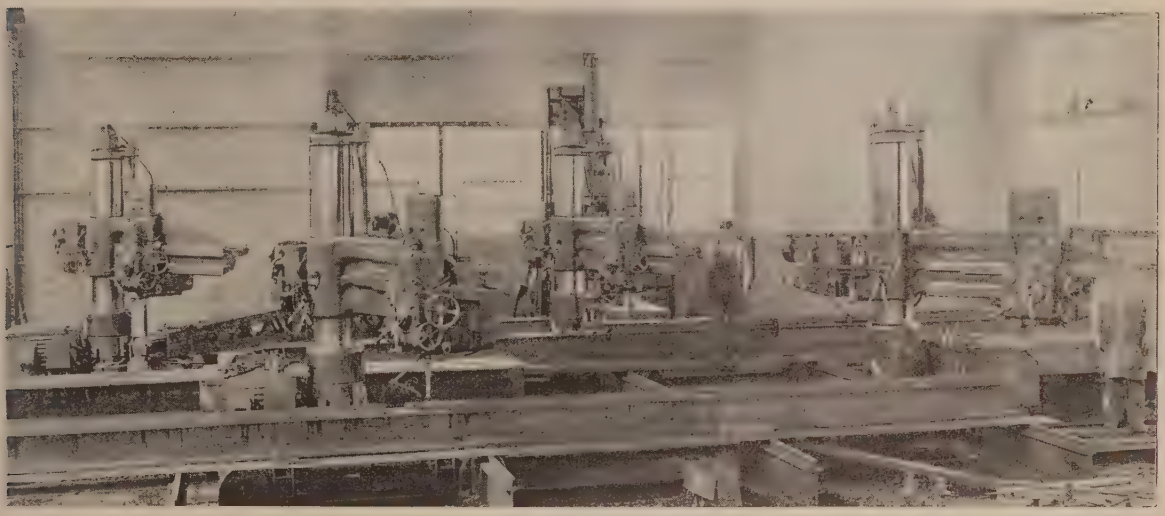
One of the important factors in expediting fabricating work was the installation by the Levering & Garrigues Co. of four special Carlton radial drills, which in actual operation have doubled the tonnage which the fabricator would have been able to turn out without them.

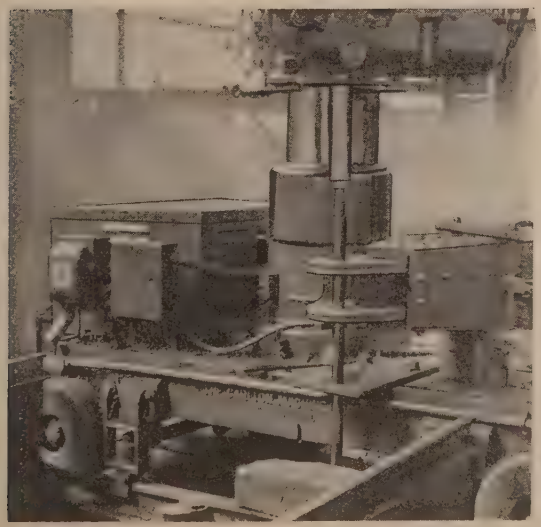
This equipment was bought after the company had received its Bank of Manhattan contract, and it was installed and in operation within six weeks from the date of the order.

These radial drilling machines are mounted on wheels which run on T-head rails and permit the machine to be moved along the work. Material, such as long I-beams, is supported on I-beams that are mounted on a concrete base and have a T-rail at the top. These work supports, at right angles to the base of the machines, are spaced on 4-ft. centers. They are, of course, carefully leveled so that the drilled hole will be straight.

The machines have 6-ft. arms. After drilling all the







A BATTERY of Four Special Radial Drills, Shown in the Center Illustration, Have Greatly Expedited Work in the Levering & Garrigues Co. Shop. These machines are mounted on wheels which run on T-head rails and permit the machines to be moved along the work

* * *

WIRES Suspended in the Compound Trough in the Floor Between the Rails Carry the Current for the Machines, a Collector Arm Passing in the Slot Taking the Current. These wires are suspended in the trough so as to be clear of the coolant, which can be taken up at any point along the rails. The arrangement of this trough is shown in the top illustration

* * *

SEPARATE Push Buttons at the Operator's Position Control the Locking, Unlocking and Traveling of the Machine Along the Rails. The lower illustration shows the rail clamp in position

holes within the 6-ft. radius, the portable base is unlocked, moved along the tracks under its own power, locked again and the drilling is continued as before. Drilling of much of the work is to templates. Centralized control of all motions is a feature that permits high-production drilling. Speed and feed changes are made at the head (through selective sliding gears), column clamping, elevating and lowering also being controlled from the head. Separate push-button control is provided at the operator's position for locking, unlocking and moving the machine along the rails.

These machines are capable of drilling up to 3-in. holes in steel. Speeds range from 12 to 1200, the number of speeds being 24. Twelve feeds, ranging from 0.009 to 0.0125 in., are obtainable. The spindle drive is by a 10-hp., 1200 r.p.m. motor mounted on the arm, and the drive of the portable base along the rails is by means of a fractional horsepower motor mounted on the base. The base is the usual T-slotted arrangement that permits clamping miscellaneous work.

Work supports, which are mounted at right angles to the runway rails, are on both sides of the runway, which makes it possible for the operator to be drilling on one side while the material is being loaded and set on the opposite side, as the arm can be moved in a complete circle. The operator thereby can obtain continuous drilling as he is not held up for the loading and unloading and turnover or for crane service.

At the top of the columns are special rotary contactors which deliver the current to all of the motors, the main feed cable coming up through the center of the column. This permits the arm to be revolved in a full circle in either direction.

Coolant Runs in Covered Trough in Floor

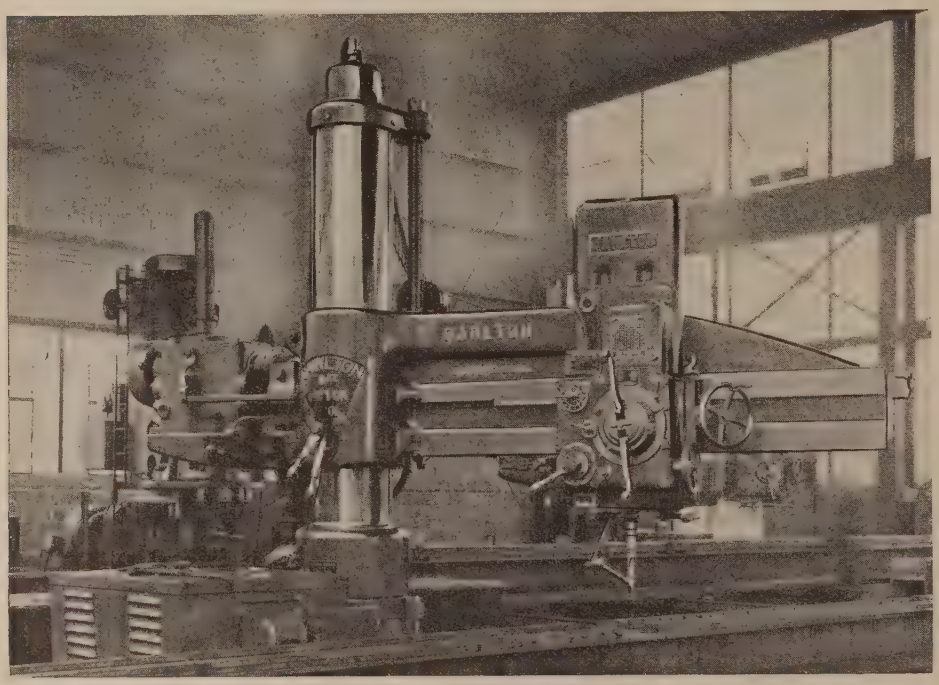
Between the rails is the compound trough, which is covered by cover plates, and there is a slot the full length of the runway which permits coolant to be taken up at any position along the rails and the return flow to find its way back to the trough after being strained.

There is also a collector arm which passes in the same slot and takes the current from wires suspended in the trough, but clear of the coolant. There is an overflow in the trough which prevents the coolant from rising above a certain height.

All bearings are ball bearings, fully inclosed, running in oil, thereby requiring lubrication attention only about every six months.

In actual practice, each machine has averaged about 1600 in. penetration a day, and this could be increased probably to 2000 in. except that the additional speed wears down the drill steel too rapidly to be economical.

Engineering work in connection with the installation of the drilling equipment was done by Wilson-Brown, Inc., 30 Church Street.



WHILE the Machine Is Drilling on One Side, Material Is Being Loaded and Set on the Opposite Side, as the Arm Can Be Swung to Either Side. Continuous drilling can be done as the operator is not held up for loading or unloading or for crane service

Various Uses for Nickel

Robert C. Stanley, president International Nickel Co., estimates the various uses in which nickel is employed, as follows, based on an output of 40,000 tons a year:

	Tons
Nickel silver	6,000
Coinage	800
Nickel plating	2,000
Structural nickel steel	14,000
Copper-nickel alloys	800
Nickel catalyzers	400
Edison storage battery	800
Monel metal	8,000
Heat-resisting electrical alloys	2,000
Malleable nickel	2,000
Nickel steel castings	800
Nickel bronze	400
Corrosion-resistant steels	400
Ferro nickel alloys	800
Nickel cast iron	400
Miscellaneous alloys	400

There is not likely to be much decline in the use of nickel for armor plate or ordnance equipment, according to "Mineral Industry, 1928," the estimate for which use is now 4000 tons per annum. New naval cruisers are not likely to cause a marked increase, since the trend of naval construction is toward the elimination of heavy protective armor in order to increase speed. The use of monel metal is firmly established, while nickel steel and nickel steel castings in railroad equipment are coming more and more into favor. In fact, the use of nickel for improving cast iron is likely to take its place as a standard practice.

Comprehensive Congress on Metals

Steel Treaters Gather Together Five Technical Organizations in National Metal Congress and Exposition—Wealth of Papers and a Diversified Exhibition

"GREATEST meeting of metal men ever held"—these were the words of Dr. Zay Jeffries, president of the American Society for Steel Treating, at the annual banquet of the National Metal Congress held in Cleveland, Sept. 9 to 13, inclusive. Facts seem to bear out this statement.

In numbers the total registration of members and guests showed 5840, the largest enrollment in some years, due perhaps to the general acceptance by industries at large of the national metal congress idea. In technical contributions, again, almost every phase was covered and their high grade was generally acknowledged. In enthusiasm, one could hardly ask for more. In smoothness of operation and handling, the congress was eminently successful. In displays at the exposition—while not larger than previous ones, in diversity, scope and attractiveness the exhibits left little to be desired.

Thomas A. Edison was made an honorary member of the steel treaters. In his enforced absence by illness acceptance was expressed in his behalf by Harvey Firestone, Sr., a lifelong friend.

A symposium on nitriding and a session on steel metallurgy were impressive features. At the exhibit late developments in rustless iron, tungsten-carbide tools, and nitrided steels were most prominent. Attendance at the National Metal Exposition was reported by Secretary Eisenman as 53,121.

Technical Features of the Congress

COMMENT was heard on every side regarding the unusual excellence of the technical papers this year. This was particularly true of the 35 papers scheduled for the ten sessions of the A. S. S. T. Besides these there were 20 papers contributed to programs for the American Welding Society, 18 for the Institute of Metals Division and 10 for the Iron and Steel Division of the American Institute of Mining and Metallurgical Engineers as well as 11 for the Iron and Steel Division of the American Society of Mechanical Engineers—94 in all for the week.

A climax was reached on the last day of the A. S. S. T. sessions. This was devoted to a symposium on nitriding. The society has never held so important a meeting nor one so largely attended—evidence of the keen interest in this new development. Dr. Adolph Fry of Germany, who originated the process, and Dr. Paul Aubert of Paris, the commercial developer, were present and spoke. Eight papers and an address by Doctor Fry were presented and briefly discussed. These are reviewed on other pages.

Another splendid A. S. S. T. session was devoted to steel

Foreign Visitors at the Congress Numbered Nearly Twenty

Dr. F. Koerber, director of the Kaiser-Wilhelm Institute, Germany.
Dr. E. H. Schulz, director of the research institute of the Vereinigte Stahlwerke, A-G., Germany.
Dr. Otto Petersen, president of the German Iron and Steel Institute.
Dr. Adolph Fry, Krupp Laboratories, Essen, Germany.
Dr. Paul Aubert, Aubert Frères et Duval, Paris, France.
Ernest Hoessrich, engineer, Gunther & Co., Frankfurt-am-Main, Germany.
J. D. Volckman, sales engineer, James W. Pyke, Montreal, Canada.
W. E. Siler, inspector of tools, Canadian National Railways, Winnipeg, Manitoba.
W. D. Pugh, research assistant, English Steel Corporation, Sheffield, England.
C. K. Everitt, managing director and works manager, Edgar Allen & Co., Ltd., Sheffield, England.
Waldemar O. Freyberg, professor, Polytechnical Institute, Harbin, Manchuria, China.
Moses M. Yaskolka, mechanical engineer, tractor department, Krasug Putilovetz plant, Leningrad, Russia.
Dr. M. Suzuki, chief of materials section, Japanese Government Railways, Tokio, Japan.
M. Sakata, Japanese Navy.
T. Nagao, Japanese Army.
Fernand Turretini, director general, Société Genevoise d'Instruments de Physique, Geneva, Switzerland.
Cesare Parone, Milan, Italy.

manufacture. A review of the four excellent papers and discussions will be printed next week.

Besides these there were over 20 papers on a variety of subjects. In so vast a program it is impossible to dwell on all the papers. Many of them will be abstracted, some with their discussions, in future issues of THE IRON AGE.

Campbell Memorial Lecture on Steels at High Temperatures

IN the Campbell memorial lecture, which attracted some 500 listeners, Dr. Albert Sauveur, professor of metallurgy, Harvard University, discussed the "Strength of Steels at High Temperatures."

A novel method of testing was utilized. The test piece was a 15-in. length of square bar, turned to ½-in. diameter for ½ in. at its center. This necked portion was placed in the middle of a tube furnace, one end of the bar clamped in a vise, the other fixed by a coupling to a shaft resting in a bearing and carrying a sheave on its overhanging end. By means of a rope and a pail of shot, a gradually increasing load was added at the rim of the sheave, thus inducing torsion in the heated test piece. Relations between twist and time were recorded on a chart.

Significant data were said by the lecturer to be the torsional strength of the hot metal, the number of twists before fracture (related to the ductility), the twisting acceleration, and the "factor of stiffness" (a relation between stress and strain).

When such data were plotted against temperature for various carbon steels the "blue brittleness" range at 300 deg. C. was strongly marked by a peak in the factor of stiffness curve. The curve showing number of twists also shows jogs at the transformation points. The curves show that at 900 deg. C. all steels (which are then austenitic) have the same torsional strength, although the angles of twist vary widely and unaccountably. "Red shortness" is believed by Doctor Sauveur to be a property of gamma iron, and to be greatest at the lowest temperature at which gamma iron can exist, namely, just above the transformation on cooling.

A few of the time-twist diagrams, instead of being a regular curve like a sine curve, looked like a series of irregular steps. That is, the piece would twist rapidly, almost instantaneously, then as suddenly stop and hold fast for several seconds. This is characteristic of the failure of ferrite when breaking in the blue brittle range, or of severely cold-worked low-carbon steel.

The lecturer did not attempt to explain this effect, but controverted the idea that blue brittleness is due to nitrogen in metal by saying that the German steel Izett, which is free from the phenomenon, analyzes 0.017 per cent nitrogen, while an American soft steel containing only 0.008 per cent nitrogen is very brittle at 300 deg. C.

Many of the alloy steels tested were similar to those examined by F. H. Norton in time-consuming creep tests (see his book reviewed in THE IRON AGE, Sept. 12, page 687). A slide was shown comparing the creep stress as determined by Norton and the torsional strength as determined quickly by Sauveur; substantial parallelism and correct mutual relationships were apparent.

An interesting atmosphere was lent to the lecture in the fact that the presiding officer was Prof. H. M. Boylston, head of the department of metallurgy, Case School of Applied Science, Cleveland, and a lifelong associate of Doctor Sauveur in their work at Harvard in earlier years.

News Items of the Congress and Exposition

DURING the week the board of directors of the A. S. S. T. held sessions, and reports of officers were made at the society's annual meeting. At the banquet several honors and awards of medals were announced. These events were as follows:

Edison Made Honorary Member

Honorary membership was bestowed this year on Thomas Alva Edison, and in an impressive manner. At the banquet President Jeffries called on Harvey Firestone, Sr., president, Firestone Tire & Rubber Co., Akron, Ohio, who accepted the honor for Mr. Edison, whose recent illness prevented his presence. Mr. Firestone, in an intimate manner, gave some account of the life in camp of Mr. Edison, Mr. Burroughs, Mr. Ford and himself.

THOMAS A. EDISON
Honorary Member

ALBERT SAUVEUR
Campbell Lecturer

Howe Medalist for 1929

Award of the Howe medal for 1929 was made to Dr. C. R. Wohrman for his paper "Inclusions in Iron and Steel" published in the *Transactions*. The medal is awarded each year for the best paper during the year, July 1 to June 30. Dr. Albert Sauveur, who was a teacher of Doctor Wohrman, accepted the medal for the medalist, giving a sketch of Doctor Wohrman's career. He could not be present, but a cable of appreciation from him was read. He is in Switzerland, where he was located by his company, Bell Telephone Laboratories, New York, so that he could be with Mrs. Wohrman in her unsuccessful struggle with illness. He is doing special optical work in Geneva.

To Frederick G. Hughes, vice-president, New Departure Mfg. Co., Bristol, Conn., the past-president's medal was presented by Doctor Jeffries.

These honors were all announced at the banquet in the ballroom of the Hotel Cleveland. Representatives of all of the participating societies sat at the head table, except those of welding society, which held its own banquet the same evening.

"An Epoch in the Making" was the subject of the chief speaker at the banquet, Dr. William E. Wickenden, who has just assumed the presidency of Case School of Applied

Science, in Cleveland. It was a splendid effort—a plea for coordinated systematic research—"the price of progress and survival is research." It is hoped to publish an abstract later.

Twenty Visitors from Abroad

At no former congress has the attendance of foreign metallurgists been so large. Nearly 20 registered during the week, some of them prominent in their fields. A list of leading ones is found elsewhere.

In testimony of the cooperation and efficiency of the management of the Cleveland Public Auditorium, Col. H. J. Twelvetree, the manager, was presented by Secretary Eisenman at the banquet with a silver loving cup.

Future Conventions

Conventions of the future have been decided upon as follows:

Semi-annual convention, New York, February, 1930, auspices New York chapter.

Annual Congress and Exposition for 1930, week of Sept. 22, 1930, at Stevens Hotel, Chicago.

Semi-annual convention, 1931: San Francisco, as the Western Metal Congress and Exposition.

Officers Report on Society's Condition

THE society is in excellent condition both from the standpoint of growth and of financial status, according to the annual reports of W. H. Eisenman, secretary, and J. M. Watson, treasurer, submitted at the annual meeting. The membership increased 16 per cent during the year and now numbers 5615, including 4844 regular members, 522 sustaining members and 228 junior members. The treasurer's report showed that the receipts during the year were considerably over expenses.

President Zay Jeffries in his annual address stressed the hearty cooperation of other technical organizations with the society for a common purpose and said that the National Metal Congress held in connection with the technical sessions could not have been possible without the cooperation of the other technical societies. He also referred to the service rendered to the metal industry by the Steel Treaters' society and other technical organizations and declared that continued growth is inevitable. He also commended the officers and members of local chapters on the policy of holding joint meetings of local societies. He characterized the personnel as a happy family working for the same purpose. Doctor Jeffries also expressed appreciation of the fine quality and high character of the exhibits at the exposition congress. He said in part:

> While the primary object of the exposition is educational, it is essentially a sales institution. Up to two years ago certain restrictions were put on salesman members of the society. The removal of these restrictions was a recognition by the society that industry is endeavoring to operate all departments with one code of ethics. A corporation cannot escape the responsibility of an employee's untrue statement with the excuse that he is a salesman. Every employee is urged and expected to reflect the integrity of the organization which he represents.
>
> And so we find this year, to an extent never before realized, presidents and others in responsible positions in attendance at the booths. In many cases, the individuals who present papers and enter into discussions at the technical sessions are also in attendance at the booths. The information given out at the booths will in most cases stand the spotlight of scientific criticism. Thus, the latest technical developments are getting from the scienists to the public with a minimum of distortion.

Los Angeles Chapter Honored

Following the usual custom of presenting the president's bell to the chapter that has won particular distinction during the year, Doctor Jeffries announced that the custody of the bell had been awarded to the Los Angeles chapter for the coming year in recognition of its activities in connection with the Los Angeles meeting. He said that the Western States Metal and Machinery Exhibition and Western Metal Congress at Los Angeles in January was a marked achievement of the year.

The nominating committee reported the list of new officers as announced in THE IRON AGE last week and these were formally elected. President-elect R. G. Guthrie occupied the president's chair during Doctor Jeffries' address. New officers are listed in another column.

National Metal Exposition Very Comprehensive

NOTABLE advances made in the iron and steel industry during the past year in processes and equipment were brought to the attention of visitors at the National Metal Exposition. The exhibit, while not larger than some of the previous shows, was unusually interesting because of its attractiveness due to the arrangement of the individual exhibits and the wide variety of products and equipment shown. There was more equipment in operation than at previous shows. The attendance was unusually good and the exhibit brought out a great deal of favorable comment. As a reflection of the interest shown, considerable of the operating equipment was sold during the week.

Rustless Iron Products a Feature

Outstanding features included a number of exhibits of rustless iron and stainless steel, the nitriding process, nitrided products and the operation of tungsten-carbide cuttings tools. Conspicuous were the numerous showings of special steels, including various rolled and cast alloy steels. Among these were non-corrosive and heat-resisting alloys and alloys having other important qualities. These exhibits made an impressive picture of what has been accomplished in developing and turning to commercial application to serve industry rolled steel and castings of numerous alloys. Among materials not heretofore shown were attractive displays of table cutlery of stainless steel. Cooking utensils of rustless iron were also shown in several exhibits.

That rustless iron has broad commercial possibilities which manufacturers are rapidly developing was indicated by the wide range of this material shown in various rolled forms as well as in finished products for the auto-

New Officers for 1930

President: Robert G. Guthrie, metallurgist, Peoples Gas, Light & Coke Co., Chicago. He is now vice-president.

Vice-President: J. M. Watson, metallurgist, Hupp Motor Car Co., Detroit; he is now treasurer.

Treasurer: O. A. Fulton, Wheelock, Lovejoy & Co., Boston.

Director: W. B. Coleman of W. B. Coleman & Co., Philadelphia.

Director: Dr. O. E. Harder, professor of metallurgy, University of Minnesota, Minneapolis.

Secretary: W. H. Eisenman was reelected secretary for two years at the Philadelphia convention in 1928. The treasurer and the two directors are elected for two years; the others for one year.

motive and other fields. In the automotive field rustless iron stampings are finding a place as radiator and hub caps and for other bright finished parts. One exhibit that attracted considerable attention was the model of a window of rustless iron to be used on the Chrysler Building in New York. Aircraft steel was shown by several exhibitors, indicating the increasing commercial importance of that field. A foreign built automobile having 25 parts of nitrided nitralloy steel attracted much interest.

Tungsten-Carbide Tools in Action

The efficiency of tungsten-carbide cutting tools was demonstrated on two lathes equipped with these tools and remarkable speed records were attained during the tests, which attracted a great amount of interest. Carboloy tools were used on a Warner & Swasey turret lathe and Widia metal on a Monarch lathe.

Furnace Equipment Liberally Shown

The display of furnace equipment, both electric and gas, emphasized the importance of heat treatment in the metal-working industries. Many of the furnaces shown were under heat. These indicated that furnace manufacturers are constantly improving their equipment in the direction of closer temperature control and more efficient operation. The equipment included two electric furnaces for heating high-speed steel, which were provided with atmospheric control, a current of combusted gases being maintained across the furnace opening to prevent air from entering the work chamber and preventing scaling and pitting of the work. One nitriding furnace of the vertical cylindrical type was shown but this was not in operation.

In a space reserved for the American Gas Association there were 12 operating exhibits of gas-heating furnaces of various types and improved models. Furnace control and temperature recording equipment in the latest types were shown by a number of manufacturers. Various furnace accessories such as sheet metal carburizing boxes with welded joints, furnace trays, conveyor chain and belts, and furnace parts of different heat-resisting metals helped to make up a very complete and interesting display. About 7000 sq. ft. was devoted to gas furnaces.

Foundry Industry Represented

The progress that is being made by the foundry industry to broaden its field of usefulness was indicated in exhibits of iron, steel and non-ferrous castings. Castings were selected for exhibit by the Gray Iron Institute to show new uses and a wide range of uses for castings as well as the machinability of small castings. One exhibit that attracted particular interest was a headstone for a grave made of a light, hollow section of cast iron and enameled to give it the appearance of granite. This had a brass inset at the top which served as a name plate.

Developments in the electric furnace steel industry were well illustrated in a group exhibit by foundries of the Electric Steel Foundries Research Group. This included exhibits by several foundries of castings in both alloy and plain carbon steel for gears, fabricated and other work and physical test specimens. Among these were heat-treated chrome steel castings for teeth for an excavating dipper.

Aluminum and Zinc Products Displayed

Advances that have been made in the aluminum industry, particularly in finding new uses for its products, were indicated by a very comprehensive exhibit of aluminum castings, made in sand, dies and permanent molds. This exhibit also included products made of rolled and forged aluminum. That this industry is reaching into the building field is indicated by a display of spandrels and sills for buildings and radiator grills. A fabricated structural

Convention Items, "Quenched and Drawn"

GETTING the most out of conventions has certainly been developed by a plan of the International Harvester Co. It is the experience of some companies that the group of men which goes to such a gathering as that of last week does not get the most out of it in view of the expense involved—"too much visiting," "too many parties," "too little attendance of technical sessions," etc. This year the chief metallurgist of the Harvester organization designated a group of his men to attend. Each morning at a breakfast they assigned certain parts of the technical program and certain phases of the exposition for certain men to see. At the end of the day they assembled and talked over the entire experience—with evident mutual profit. Could not this plan be followed profitably by some other companies?

* * * * *

TOMBSTONES of cast iron—yes, this is a late development. In the booth of the Gray Iron Institute there was a small tombstone of gray iron enameled to imitate granite. Unless one knew how it was made, the disguise was good. A new industry?

* * * * *

OFFICERS of other technical societies not participating in the congress were seen here and there. C. E. Hoyt, executive secretary, and R. E. Kennedy, technical secretary, of the American Foundrymen's Association were present. The foundrymen will hold their annual convention and exposition in the same place the week of May 12, 1930. Most of the board of directors were in Cleveland for a meeting Sept. 12 and 13.

* * * * *

COMMITTEE meetings of two other technical organizations were held during the week. Several committees and subcommittees of the A. S. T. M. held routine sessions. There were also conferences of one or two committees of the A. F. A.

* * * * *

HAS the A. S. S. T. a "main spring"? It certainly has in the person of its efficient secretary, William H. Eisenman. For 11 years he has been indefatigable in developing an organization having one chapter with 200 members to one of over 35 chapters with about 5900 members in units operating from coast to coast.

* * * * *

SOON after entering the main part of the Public Auditorium, where most of the steel company exhibits were located, the impressive figure of a portly and gaily decorated Indian effectively called attention to the exhibits of J. B. Ford & Co., Wyandotte, Mich.

THOSE in charge of technical sessions are to be commended on the manner and smoothness with which they were conducted. Excellent chairmen were provided, insuring the success of any such meeting. Liberal written discussions of most of the papers helped to keep the wheels turning and the interest keen.

* * * * *

A NOVELTY in distributing favors was the presentation of a card entitling the one whose name appeared on the card to an airplane ride over Cleveland and vicinity in one of two planes owned by the General Alloys Co., Boston. The airplanes are six-passenger Stinson cabin monoplanes powered with Wright whirlwind engines, 220 and 300 hp. respectively. All flying was under the supervision of "Dal" Speer, assistant sales manager, G. A. Co.; he is a captain in the United States Air Service, has had 12 years flying experience and over 6000 air hours.

* * * * *

MANY a steel treater thought he saw a distinguished American diplomat in the corridors of the Hotel Cleveland. It was none other than the genial "Doc" Langenburg, whose resemblance to General Dawes is striking—particularly when he has that pipe (not underslung however) in action and his Fedora hat at the proper angle.

member for the Goodyear Zeppelin dirigible also attracted interest, as did a large ornamental street light bracket of cast aluminum.

Another field into which the aluminum industry has entered, as was shown by exhibits, is the manufacture of furniture. What can be accomplished in decorative work was shown by a spandrel made of an aluminum casting with enamel design baked on in colors. Another non-ferrous metal exhibit showed zinc products in die-castings and rolled form.

Welding machines of numerous types for various forms of welding were exhibited and indicated the carrying on of important development work in this field. Several were working units that attracted much attention. Numerous samples of welded joints were shown and these, with the welding machines and numerous exhibits of welding accessories, indicate the important place that welding has taken in the metal-working industry.

Welding and Other Machinery

Working exhibits included an automatic welding machine for pipe seam welding. Another operating unit was an automatic arc welder for welding circular joints, this being operated in adjoining pipe sections. Among interesting examples of welding was an airplane fuselage made of chrome-molybdenum tubing with welded joints, the welding of Ford car parts and the arc welding of thin sheets of steel and of aluminum and copper alloys. Displays of welding and cutting torches and accessories were numerous.

Machinery of various types was exhibited by a number of makers. These included die making machines, jig borers, punches and shears, drilling machines, sawing machines and polishing and grinding machines.

Many Steel Companies There

Many other important displays cannot be referred to in this necessarily brief report. It should be mentioned, however, that the exhibits of steel companies, both American and foreign, were more numerous and comprehensive than ever before.

Total space devoted to the National Metal Exposition was about 80,000 sq. ft. of which 20,000 sq. ft. mostly steel companies was in the main auditorium and 60,000 sq. ft. in the annex where the working exhibits were located.

Commercial Steel Treaters Organize

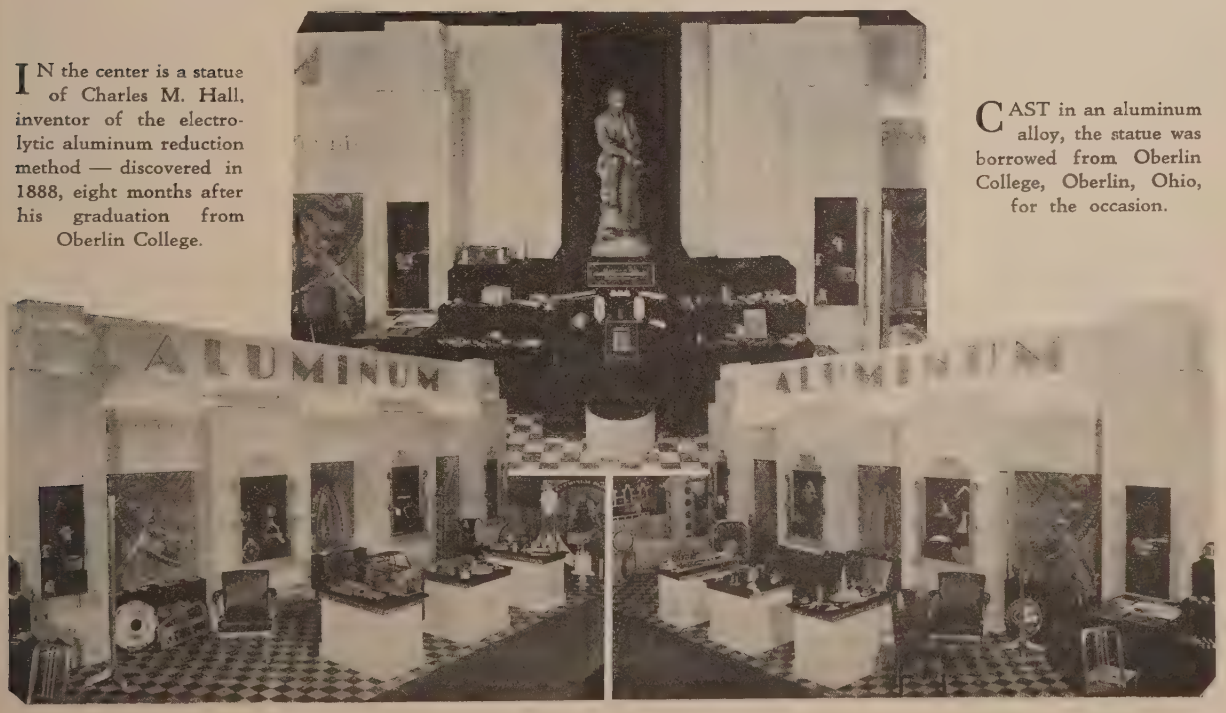
Several commercial heat treaters held a meeting in Cleveland last week during the Steel Treaters' Convention to discuss plans for a permanent organization with a view to cooperating in publicity and other work that would tend to serve their industry. Those present were Theodore Barker, president Accurate Steel Treating Co., Chicago; O. T. Muelemeyer, O. T. Muelemeyer Co., Rockford, Ill.; President Lindberg of the Lindberg Steel Treating Co., Chicago; A. D. Bach, president New England Metallurgical Corporation, South Boston, Mass.; C. W. Derhammer, Lakeside Steel Improvement Co., Cleveland; N. M. Salkover, vice-president, Queen City Steel Treating Co., Cincinnati, and Stanley P. Rockwell, S. P. Rockwell Co., Hartford, Conn. Other commercial steel treaters who might be interested in joining an association are invited to get in touch with any of the men who attended the Cleveland meeting.

British Researches In Metals

Important metallurgical researches under way at the National Physical Laboratory, Teddington, England, include a search for a stainless iron-nickel-chromium suitable for castings; a microscopic examination of specimens in a vacuum under high temperature and load (creep); a study of the effect of gases on the solidification of steel ingots; the determination of the equilibrium systems iron-silicon and iron-manganese; and the effect of considerable quantities of phosphorus, arsenic, bismuth and antimony upon copper.

Impressive Display of Progress in Aluminum

IN the center is a statue of Charles M. Hall, inventor of the electrolytic aluminum reduction method — discovered in 1888, eight months after his graduation from Oberlin College.



CAST in an aluminum alloy, the statue was borrowed from Oberlin College, Oberlin, Ohio, for the occasion.

Notable Symposium on Nitriding

Dr. Fry, German Originator of Process, Discusses Recent Developments, and Eight Americans Contribute Results at Valuable Session of Steel Treaters

HARDENING steel with ammonia gas, or nitriding, was given special prominence at the National Metal Congress last week at Cleveland. With the German originator of the new process and the French promoter of its commercial use outside of Germany both present, unusual color was lent to the symposium on the subject that was held Sept. 13. It was a rare one-topic technical program even for the American Society for Steel Treating. Besides eight papers by Americans who have been working on the process, there was an address by Dr. Adolph Fry, Krupp Laboratories, Essen, Germany, and brief remarks by Dr. Paul Aubert, Aubert Frères & Duval, Paris, France.

That there is keen interest in this subject is evident from the attendance—at least 600 at the morning session in the ballroom of the Hotel Cleveland and over 400 at the afternoon session in a special room in the Public Auditorium. Contributing materially to the success was the efficient guidance of the sessions by the two chairmen, Dr. George B. Waterhouse, professor of metallurgy, Massachusetts Institute of Technology, Cambridge, Mass., and H. J. French, metallurgist, International Nickel Co., Bayonne, N. J. In this report it is possible to touch only on a few of the chief points brought out by the papers and the many discussions. The entire proceedings are to be issued by the A. S. S. T. as a special edition of the *Transactions* within the next six weeks; no papers were preprinted.

Nature of the White Layer in Gun Tubes

Not until nitriding was studied was it really known what causes the hard layer inside of large guns after firing, said Dr. H. H. Lester, Watertown Arsenal, Watertown, Mass., in opening the program with his paper "The White Layer in Gun Tubes." This hardness is caused partly by solution of the nitrogen in the steel. It is possible to have an austenitic nitride case. This case has possibilities of superior characteristics; it is tougher and more adherent. The austenitic case may be obtained with other than aluminum steels. Dr. Lester expresses the opinion that by proper cooling the case may be martensitic and that it may be subsequently tempered to give desired characteristics. Many slides were shown of the layer and structure in gun tubes.

Both Dr. V. O. Homerberg and Dr. John P. Walsted of the Massachusetts Institute of Technology said that Dr. Lester's views are confirmed by their own laboratory work and that the white layer is due to a solution of the nitrogen.

Besides a paper by Dr. Fry, not scheduled, three contributions were read and all were discussed together. The three papers were: "Observations in the Iron-Nitrogen System" by Samuel Epstein, Illinois Steel Co., South Chicago, Ill.; "A Study of the Nitriding Process" by Prof. V. O. Homerberg, and Dr. John P. Walsted, Massachusetts Institute of Technology; and "Researches in Nitriding Steels" by Prof. O. E. Harder, J. T. Gow and L. A. Willey, University of Minnesota.

Dr. Fry Offers Latest Developments

All results of investigations here thus far are in agreement with those in Europe, said Dr. Fry in his interesting address. When nitriding is properly carried out, certain hardness with no distortion is achieved. The physical properties of the core are not changed and the hardness and wear-resistance are higher than by any other process. Hardness is not injured by drawing to even above 950 deg. Fahr., and nitrided parts are free from internal stresses and aging effects, and are rustless. The process is adopted to various applications having varying requirements—select the nitralloy of proper composition. Best results are obtained by quenching and tempering the raw material, then by machining and nitriding.

Conditions which should be avoided, continued Dr.

(All from Doctor Lester's Paper)

Fry, are: Surface oxidation; foreign metals touching the nitralloy, such as nickel not saturated with nitrogen; and foreign substances in the ammonia, such as air or water.

Some points not yet in agreement, said Dr. Fry, are: Experiments with higher pressures must be carried out in more detail; higher nitriding temperatures shorten the time of nitriding but will entail disadvantages and may even be dangerous.

Nitriding Not Yet Fully Explained

There is not yet a complete and well substantiated explanation for nitriding hardness, said Dr. Fry, who advocated the use of all researchers of the Vickers or Firth figures. Continuing to discuss the theory, he said that the hardness of the nitrided layer is not to be attributed to the hardness of the alloy nitrides themselves. It may be suggested with some assurance that the mechanism of the nitrogen hardening bears some resemblance to quenching and hardening steels in so far as both seem to be caused by space lattice distortion.

Practical Problems Outlined

Among practical problems of nitriding, the German inventor enumerated the following: Getting more experience in choosing the best nitralloy for each purpose. Machining of nitralloy with even higher core strength without leaving machining stresses. Making drop forgings and hot-pressed pieces free of surface oxidation which would otherwise cause inferior quality of the nitrided layer. Research on nitriding cast iron. Catalysts as nitriding agents.

Abstracts which would do justice to the three authors enumerated above are not possible here. They will be printed in an early issue. In Mr. Epstein's paper a tentative diagram of the Fe-Ni system has been drawn in which modifications of the two existing diagrams by Fry and Sawyer are proposed. Dr. Homerberg's splendid contribution is mainly a study of four steels selected for investigation of the influence of nitriding on the core properties. It is shown that the reduction of impact value is not due to the presence of nickel and that molybdenum as an alloying element is valuable in preventing the reduction of impact resistance. Some fine slides of photomicrographs of case and cores with superior structures were shown, resulting from various heat treatments. Dr. Harder's excellent paper presents a comprehensive study of the availability of a long series of steels, alloy and non-alloy, for nitriding.

Prominent British Metallurgist Speaks

Before the close of the morning session Dr. Waterhouse called to the platform a prominent English metallurgist visiting the National Metal Exposition—C. K. Everitt, managing director and works manager, Edgar Allen & Co., Ltd., Sheffield, England.

Apart from the advantages of hardening by nitriding with the elimination of distortion, Mr. Everitt said he was not sure that the older processes did not possess some advantages in the fact that rolling and wearing parts require grinding.

High-Frequency Furnace Commended

The call for alloy steels is tremendous and in this field the high-frequency electric furnace is to be a large factor. The Edgar Allen company was one of the first to install this unit on a commercial scale, he said, and it has been found very valuable commercially and experimentally. It is extremely useful for higher alloy steels. A 600-lb. furnace is making 30 to 40 tons of high-grade steels per week at Sheffield and the ingots range in size from 3 in. to 6 in. square. It is economical; about 830 kwhr. is the experience per ton of steel. "I want to

American Sontributors on Nitriding of Steel

HORACE H. LESTER | A. B. KINZEL | ROBERT SERGESON | JOHN P. WALSTED | O. E. HARDER

testify to the practical usefulness of such a convention and exposition as this and am glad to be present. After my last visit of six years ago, I note great progress in your wonderful country."

Other Phases of Nitriding

INTRODUCING the afternoon session two of the four papers were presented first: "Investigations in Nitriding" by Robert Sergeson, Central Alloy Steel Corporation, Canton, Ohio, and "A Few Practical Fundamentals of the Nitriding Process" by H. W. McQuaid, Timken-Detroit Axle Co., Detroit.

New data are offered by Mr. Sergeson as to the effect of (1) increased flow of ammonia gas, (3) effect of increase of nitriding temperature in lowering hardness of the case, (3) effect of varying aluminum content, (4) effect of nickel, and (5) duplex methods of nitriding. A method of removing brittleness is made public. Nitrided and carburized cases are compared in respect to hardness penetration and effect of reheating temperatures on the hardness of the case.

Nitriding Plain Carbon Steels Possible

Plain carbon steels can be nitrided just as hard as nitralloy steels was the surprising statement of Mr. McQuaid. Desiring materials better than the case-hardened, Mr. McQuaid said his company approached the subject from the users' standpoint. Nitralloy steels can be nitrided commercially so that they are superior to carburized steels, except in machinability. They are all white hard, resist corrosion, do not distort and possess high impact values. Stainless steels cost 20c. to 30c. per lb. while nitrided are 7c. to 12c. per lb. There is no loss due to grinding cracks. His plant is operating night and day on nitriding plain carbon and other steels. The steel must be put in the sorbitic condition but nitriding steels require higher temperatures and a severer quench. Mr. McQuaid said he was an advocate of duplex nitriding—at high, then low temperatures.

New Etching Solution Explained

A new etching medium which he claims brings out better the constituents of nitrided steels was mentioned by A. B. Kinzel, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y. It is, briefly, absolute alcohol with enough water to hold copper sulphate and copper chloride in solution. It is slightly acidulated.

Pointing out the remarkable parallelism of effort revealed by the papers, G. H. Eaton, Molybdenum Corporation of America, Pittsburgh, made a plea for the parcelling out of various lines of work and recommended careful check of all work by duplicate tests, suspecting that this had not always been the case. It was announced that a committee, with Dr. Homerberg as chairman, had been appointed with the aim of systematizing all investigation.

Some interesting observations were made by Sam Tour, New York. In his war and post-war experience it had fallen to his lot to try to find a steel that would stand up in the reaction chambers of synthetic ammonia plants—evidently the nitride case breaks down after heat treating following nitriding. Also impurities in the ammonia should be guarded against.

That nitrided steels containing inclusions result in pitting was the experience of V. T. Malcolm, Chapman Valve Mfg. Co., Indian Orchard, Mass., as well as their corrosion in ordinary tap water. Suitable nitralloy steel properly nitrided, he testified to as very valuable in high temperature, high pressure steam valve applications, and showed on the screen many views of nitrided products and their long life.

Short-Time Nitriding in Molten Salts

SPEEDING up the nitriding of steel was dwelt upon by A. B. Kinzel and J. J. Eagen, Union Carbide & Carbon Research Laboratories, in a paper "Short-Time Nitriding of Steels in Molten Cyanides." The authors claim good results in much less time than the 90 hr. for ammonia nitriding by nitrogen concentration and close contact. Liquid media were investigated and a mixture of sodium and potassium (53 per cent) used. Very satisfactory results are claimed with a case of 0.005 in. obtained in one to two hours. In wear tests some of his products under corrosive conditions have exceeded 66,000,000 revolutions as compared with failures of carbon steels at 17,000,000 revolutions. The authors claim the case obtainable to be three times as hard as that by the ammonia hardening.

The last claim was taken exception to by Dr. Homerberg who pointed out that with a Brinell hardness of 1000 with ammonia, it was impossible to increase this threefold. To this Mr. Kinzel replied that everything depends on the method of testing the hardness. As to a criticism that the same results would not be obtained with commercial salts as contrasted with the pure salts used by

the authors, Mr. Kinzel stated that equally good results had been secured with regular products.

Practical Use of Nitrided Products

Some important practical applications of nitrided products were described by V. T. Malcolm, Chapman Valve Mfg. Co., in a paper which closed the symposium—"Using Nitrided Steels in High Temperature, High Pressure Service." The author's experience with these steels has evidently been broad. He threw on the screen numerous views of the successful use of nitrided valve rings and other parts which had outlasted some other materials such as rustless iron. He declared that nitrided steels do resist corrosion at high temperatures and high pressures and are very hard. Their chemical stability is a property and their resistance to wear, abrasion and erosion is unquestioned in his experience. These steels combine hardness and toughness with extreme hardness on the outside and are suitable for valve rings and disks. Such steel is machined before treatment and not ground.

Welders Devise Non-Destructive Tests

Methods Described Whereby Strength of Joint May Be Investigated Without Pulling It Apart—Welding of Pressure Drums and Thin Sheets Also Discussed

TWO features of the fall meeting of the American Welding Society are of note. One is the evident progress toward the solution of the problem of non-destructive tests, and the second is the number of contributions from university laboratories and research students. Beyond these were the many technical and committee meetings, the exhibit (held in conjunction with the Steel Treaters), and the usual social functions. Perhaps the two features mentioned above are evidences of one main line of progress toward reliable joints by welding. At any rate, time was not so long ago that the welding fraternity discouraged and discounted heavily any work done in academic circles because of the suspicion that the joints made by unknown welders might not be representative of what could be expected in standardized practice.

Portable Testing Machine for Pipe Joints

F. G. Tatnall, Southwark Foundry & Machine Co., Philadelphia, read a paper on "How to Test Welds," in which he discussed the tensile test as made by a hydraulic testing machine and recorded electrically on a Leeds & Northrup potentiometer and the bend extensometer described in THE IRON AGE, Sept. 6, 1928, page 575. Other devices for recording at a distance by telemeter were described in detail. But it was pointed out from the floor that tests of completed structures, whether welded or made by any other means, are properly the function of the designing engineer or the architect representing the owner. Furthermore, such details as the speed of testing should be resigned to the materials testing specialist. Welding engineers should be primarily interested in testing the qualities of the welded joint, and these tests should simulate as nearly as possible the strains which must be resisted by the weld metal in service. In other words, pipe joints should be tested in tension, structural joints ordinarily in shear and so on.

A tension testing machine, portable enough to be taken into the field, and rugged enough to stand rough treatment, has been developed by Mr. Tatnall's firm in conjunction with Union Carbide & Carbon Research Laboratories. It is contained in a shortened oxygen cylinder. One end contains a hydraulic pump, hand operated, which exerts stress on the specimen by means of suitable spherical clamps. A hinged door is cut into the side of the cylinder, permitting the test specimen to be inserted in the grips. Stress is read from a removable pressure gage. The whole machine weighs about 200 lb., and has an accuracy of about 2 per cent even after having been dropped 5 ft. on a concrete floor. It is designed to be taken into the oil fields and test coupons cut from steel pipe joints by a portable milling machine. (The slots in the pipe are later welded shut.) In this way any suspicious joint can be checked immediately, and if necessary the welder's work corrected. It was noted, however, that the welding of slots in closed pipes was liable to introduce strains of greater moment than the defect which might be discovered, and consequently the use of field testing should be confined to the occasional task of checking, at irregular intervals, the work of qualified welders and inspectors.

Detecting Flaws With Heavy Electrical Currents

Elmer A. Sperry, president American Society of Mechanical Engineers, wrote a paper for this meeting entitled "Non-Destructive Testing of Welds," in which he described a machine built along the lines of the one for detecting rail fissures* but adopted for boiler drums. Reference to the citations will show that the machine includes a powerful direct current generator, which by means of suitable contact brushes passes several thousand amperes of low voltage current through the metal to be tested. Three lighter contacts set fairly close together by-pass a little of this current if deflected by an internal flaw, and these variable currents are magnified by familiar vacuum tubes until they are powerful enough to throw aside a stylus on a recording chart.

While the machine is still in experimental development for welded joints in steel plates, it has great possibilities as proved by its success when mounted in an inspection car and used for detecting internal fissures in railroad rails. It can detect openings of microscopic width; thus, the surfaces of contact between a pair of Johannsen blocks, held together with 5000 lb. pressure, gave a resistance per unit length 175 times that of the sound metal.

"Listening-In" on Defects

A simple scheme for testing welds without destroying them was described by C. O. Burgess, A. B. Kinzel and A. R. Lytle, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y. ("Non-Destructive Testing of Welds with the Stethoscope and X-Ray"). It merely consists of a physician's stethoscope and a peen hammer. The observer taps the plate or joint, systematically covering the area, and listening to the tone emitted through the stethoscope. According to the authors, the quality of tone is such that fairly small internal defects may be spotted, and is so definite in nature that various laboratory men with no previous experience with the method were able to duplicate each

*See THE IRON AGE, Oct. 11, 1928, page 907; Nov. 1, 1928, page 1089; Nov. 15, 1928, page 1214.

other's operations. A number of plates welded by student members were explored in this way, and then the joints X-rayed at the suspected spots. In all cases flaws were shown on the films, either when the rays penetrated parallel to the scarf or perpendicular to the plate Sufficient experience has been had with the combined method—stethoscope and X-ray—so that the authors are able to predict the strength of a welded joint containing slight defects within an accuracy of 3000 lb. per sq. in.

Boiler Code to Be Liberalized

This progress toward the non-destructive testing of welds was pronounced by C. W. Obert, secretary of the American Society of Mechanical Engineers' Boiler Code Committee, to be one impressive factor which will enable welding to rise above its present limitations as a joint for pressure vessels. This remark was made in discussing a brief paper on "Foreign Practice in Welding of Boiler Tubes and Drums" by G. A. Orrok. Mr. Orrok reports that high pressure shells are usually hammer welded up to 2 in. wall thickness. Boiler drums with forged ends welded with the oxy-acetylene process are quite common.

Both gas and electric welding are used for penstocks, which are welded as a rule. European boiler makers are apparently adopting welding and cutting as production tools at a rapid rate, and Mr. Orrok mentions particularly that the two objections commonly heard of late years, namely, the lack of resiliency in weld metal and the variation in welder's skill, are heard less and less often, due to improved methods of welding, proper inspection, accumulated experience and the large amount of test data.

Further in commenting upon these European conditions, Mr. Obert said that the Boiler Code Committee is about ready to promulgate a revision of the unfired pressure vessel code, allowing all-welded drums up to 60 in. diameter, 200 lb. pressure, and stress on butt welds a maximum of 8000 lb. per sq. in. These revisions have been made after receiving the cooperation of a committee from the American Welding Society. The latter was able to submit recommended procedures for manual welding by both gas and arc process which, if followed, would in all probability produce an eminently satisfactory joint.

At the present time, however, welding seems to have 1½ in. plate as a maximum limit; forged drums are very expensive, consequently the field is open for fusion welding. In Mr. Obert's opinion, automatic arc welded drums would be admitted within the provisions of the code as soon as the Welding Society could propose a recommended procedure. This has been hampered so far by the secrecy of the firms who have been successful in this line.

Correcting Magnetic Blow When Welding Thin Sheets

W. L. Warner, General Electric Co., Schenectady, N. Y., presented an interesting discussion of "Automatic Arc Welding of Thin Sheets." It is known that a good butt joint is difficult to make by arc welding in sheets of 12 to 14 gage, because the arc burns holes in the metal if the travel is slow enough to give sufficient time to melt and alloy the abutting edges. In order to keep the work in line and prevent distortion, rigid clamps and a backing bar are required. These necessary adjuncts introduce serious magnetic field, induced by the welding current, which cause marked instability in the flame, pulling it forward at the beginning of the seam, and blowing it backward at the end.

Mr. Warner described a device to correct this in the form of an insulated conductor loop placed close up to the under side of the copper backing bar. The operator sends a certain portion of the welding current through this loop, regulating its intensity sufficiently to counteract the "blow" mentioned below. By this device, clean steel sheet with carbon less than 0.25 per cent can be welded commercially into a joint of 85 per cent efficiency. Fourteen gage has thus been welded at a speed of 29 in. per minute (speed on 14 gage range boilers is about 16 in. per minute). Sixteen gage butt welding is about the mimimum limit for butt welds, although 4-ply edge welds on 18 gage stampings for automatic mufflers are being welded at 50 in. per minute.

It is not always necessary to weld clear through to the bottom of the seam. For instance, banjo rear axle housings for light cars are made from 3/16-in. stampings. Welds at the rate of 22 in. per min. are made, with only two-thirds penetration, since it is found that such a joint is oil tight and sufficiently strong. Galvanized iron may also be welded at high speed and partial penetration in order to avoid volatilizing all the protective zinc on the inside of the seam.

Manually, this magnetic blow may be corrected in several ways, as noted by different commentators. The simplest is to hold the electrode in such a way that it points in the direction of blow. Magnetic blow does not exist in fillet welds; in butt welds it can also be minimized by tack-welding the joint at the ends, thus closing the magnetic circuit, or by running a light bead on the back side of the joint. Or, as other speakers remarked, it might be avoided altogether by the use of atomic hydrogen or oxy-acetylene welding.

Corrosion of Steels and Irons in Sea Water

Five years ago the British Institution of Civil Engineers caused to be exposed in four marine locations several concrete frames containing bars and assemblies of commercial construction materials. Three identical frames were in each exposure, one to be examined after five years, the next after 10, and the last after 15. A report has now been issued in which Dr. J. Newton Friend discusses the results of the five-year tests.

In detail many differences in the behavior of the metal have been observed. Thus at Colombo the completely submerged bars corroded about 10 per cent more than at Plymouth, but in alternate wet and dry exposures the ratio of corrosion was anything from three to six times, and the air exposures 10 times as great.

The most resistant alloy tried was the 36 per cent nickel steel; next is usually the 13.5 per cent chromium steel (although in wet and dry exposure at Colombo this was virtually destroyed by localized corrosion). Cast iron is nearly as good as these two in most exposures. Additions of ½ and 2 per cent copper were also very effective.

Data on Chains and Belts for Conveyors

A comprehensive general catalog, No. 330, has been issued by the Chain Belt Co., Milwaukee, in a book of more than 800 pages measuring 7½ x 10½ in. This gives a great amount of information, with illustrations, pertaining to the products manufactured by both the Chain Belt Co. and its subsidiary, Stearns Conveyor Co. Many of the illustrations show installations of the equipment manufactured, and the list of industries served is impressive. Other illustrations, and they are numerous, show parts of the equipment in conjunction with tables of dimensions, prices, code numbers and other pertinent data.

Nearly 250 pages are taken up with the description and information regarding chains and sprocket wheels. Belt power transmission, gearing of various types, shafting, clutches, bearings, elevator buckets and bucket elevators, skip hoists, hoppers and feeders, apron and pan conveyors, belt conveyors, screw conveyors, slat conveyors and many auxiliary features follow. Overhead suspended conveyors are given a section, while those specially devoted to foundry use are handled separately. A 14-page index completes the work.

Second Machine Tool Exposition Will Have Many New Developments

WITH the machines and other products of some 240 companies on display in almost 100,000 sq. ft. of floor space, and with many new developments, amounting in some cases to innovations, the second National Machine Tool Builders' Exposition to be held in the Public Auditorium, Cleveland, Sept. 30-Oct. 4 should prove even more interesting and profitable to metal-working executives than the 1927 exposition.

Floor space occupied, both gross and net, and the number of exhibitors are larger than previously by some 30 per cent. The gross floor space this year totals more than 136,000 sq. ft. At the first show more than 500 machines were in operation and there were extensive displays of small tools, gages and other equipment; this year's show will be larger in both respects. Machinery will be tooled for production work on automobile, airplane engine, locomotive and other parts, and machine tool executives, designers, and others in attendance will exceed 3000.

Although the past two years have been a busy period for most machine tool builders, it will be evident that development work has not been neglected. On the whole, equipment is heavier, more powerful and faster, has more automatic features and is handier to operate than even a few years ago. Flexibility, enabling convenient change-over for mass production of different pieces, is notable in many lines. Hydraulic feeds are increasingly applied, and their use extended to at least one automatic lathe. Ball and roller bearings are even more widely used than heretofore, and automatic lubrication is applied wherever possible.

Then there is the tungsten carbide cutting tool, with its full production possibilities still a matter of investigation. Comprehensive data regarding application of this material may be had at the Show, not only from manufacturers who will display and demonstrate these tools in turning and other operations, but from makers of small tools and from a number of machine tool builders who have experimented with these tools in connection with their own machines.

The Machine Tool Congress, the production group of the Society of Automotive Engineers, and the machine-shop practice division of the American Society of Mechanical Engineers will hold technical sessions in Cleveland during the week of the exposition.

Some of the equipment to be exhibited is briefly described and illustrated in following pages. A list of companies exhibiting, with enumeration of products to be shown and names of representatives in attendance, is also given. Other new developments seen at the Show will be included in forthcoming issues of THE IRON AGE.

Exhibitors and Products to be Shown at Machine Tool Exposition

A

Abrasive Machine Tool Co., East Providence, R. I. Booth 2W 5.
No. 3 surface grinder, 22 x 8 x 12 in.; No. 33 surface grinder, vertical spindle, 22 x 7 x 12 in.; No. 5 surface grinder, 48 x 14 x 14 in.; dust exhaust attachment; wet grinding attachment; magnetic chucks; self-contained d. c. generator; dial test indicator; 8 in. index centers; 8 in. semi-direct index centers. Represented by: F. N. MacLeod, N. D. MacLeod, C. G. MacLeod, K. B. MacLeod, W. Sceeles, E. S. Cornell.

Acme Machinery Co., Cleveland. Booth 2D 5.
Acme all-steel bolt heading, upsetting and forging machine; bolt threading machine, cutting standard style of thread; semi-automatic nut threading machine; nutting-up machine. Represented by: H. N. Anderson, sales manager; R. D. Davies, secretary and treasurer; K. F. Bruch, vice-president.

Acme Machine Tool Co., Cincinnati. Booth 2B 14.
17 and 4½ in. Cincinnati Acme full universal hexagon turret lathe: No. 1 Cincinnati Acme semi-universal hexagon turret lathe. Represented by: Charles Meier, Fred Winkelman, W. Behrens, H. V. Myers, Lee G. Leon.

Ahlberg Bearing Co., 317 East Twenty-ninth Street, Chicago. Booth 4W 10.
"CJB" Master ball bearings; Ahlberg ground bearings. Represented by: C. J. Bender, president; G. L. McGregor, assistant sales manager; B. B. Clark and R. H. Kelly, district sales managers; B. S. Okner, chief engineer.

Charles G. Allen Co., Barre, Mass. Booth 1W 11.
Sensitive ball bearing drilling and tapping machines. Represented by Charles G. Allen, Charles G. Allen, Jr.; John S. Wecks.

Allis-Chalmers Mfg. Co., Milwaukee. Booth 5C 11.
"Texrope" speed reduction unit in operation; totally inclosed fan cooled motor; squirrel case induction motor; d. c. machine tool motor. Represented by: A. H. Wyman, district manager; V. E. Walters, W. F. Sheriff, M. V. Bailliere; F. A. Miller, salesman, Cleveland district; L. E. Grothaus, assistant manager, electrical department, Milwaukee; J. C. Rattermann, assistant manager, electrical department, Norwood, Ohio; Walter Geist, assistant manager, milling department, Milwaukee.

American Broach & Machine Co., Ann Arbor, Mich. Booth 1W 22.
Hydraulic, vertical and horizontal broaching machines; broaching tools; hydraulic presses. Represented by: Francis J. Lapointe, president; David A. DeLong, secretary; J. A. Livingstone, sales representative; William Pfeil, tool designer; J. E. Jones, engineer.

American Tool Works Co., Cincinnati. Booth 2D 3.
Lathes, radial drills, shapers—all motor driven. Represented by: J. B. Doan, president and general manager; A. E. Robinson, works manager; R. S. Alter, vice-president and foreign manager; L. W. Scott Alter, assistant to president; J. C. Hussey, sales manager; H. W. Schatz, Eastern sales manager; D. M. Bartlett, C. H. Cormany.

Armstrong-Blum Mfg. Co., Chicago. Booth 4A 5.
Marvel metal band sawing machine; automatic high-speed saw; hack sawing machines; high-speed edge hack saw blades. Represented by: Harry J. Blum, George J. Blum, Fred J. Blum, Stanley A. Woleben, H. Conrad, Walter S. Ryan, J. E. Van Doren.

Armstrong Brothers Tool Co., 317 North Francisco Avenue, Chicago. Booth 4C 2.
Lathe, planer and shaper tools; lathe dogs; clamps; ratchet drills; drop forged wrenches; pipe vises; pipe cutters; stocks and dies; pipe wrenches; machine shop specialties. Represented by: Horace Armstrong, A. Arbogast, S. W. Welter, George Nufer.

Arter Grinding Machine Co., Worcester, Mass. Booth 1W 8.
12-in. rotary surface grinder with magnetic chuck, wet grinding equipment, including pump and tank, arranged for motor drive complete with motor; No. 132 automatic cylindrical grinder with wet grinding equipment including pump and tank, with complete tooling for grinding valve stem guides, arranged for motor drive complete with motor. Represented by: William Arter, president; Warren F. Fraser, works manager; Albert B. O'Donnell, sales manager.

Associated Machine Tool Dealers, 551 Washington Boulevard, Chicago. Booth 2W 0.

E. C. Atkins & Co., Indianapolis. Booth 5C 6.
No. 18 "Kwik-Kut" power hacksaw; No. 7 Kwik-Kut power hacksaw; No. 4 metal cutting bandsaw; Silver-Steel hack-

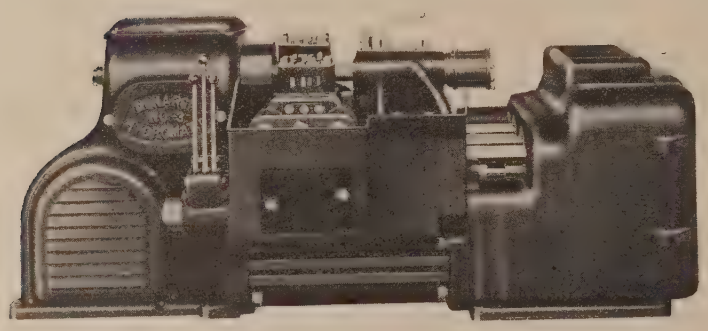
Automatic Lathe with Hydraulic Feeds



AN automatic lathe featuring hydraulically-actuated carriages and tool slides and simplified mechanical construction, resulting in increased production and lower unit cost, will be introduced by the Monarch Machine Tool Co., Sidney, Ohio. Cams and feed gears are eliminated and the carriages and tool slides travel on round steel bars instead of the usual cast iron ways.

The feed cycle, consisting of rapid approach to the work, feed at a predetermined rate or rates, and rapid return to the starting position, is automatically controlled. Positive adjustable diameter and length stops facilitate accurate duplication of cuts.

The headstock unit is a separate casting and houses the motor, which drives the spindle through silent chain or belt, multiple-disk clutch, worm gearing and pick-off change gears at the front of the headstock. Timken roller bearings are used throughout, and all revolving parts dip in oil. In the headstock is an 80-gal. per min. coolant pump, driven from the main motor. One lever starts and stops the spindle, coolant pump and hydraulic feed of both carriages. The middle section of the machine contains a large cast iron chip pan and coolant reservoir and is keyed and bolted to the head stock and tail-end housing. The latter houses the hydraulic mechanism, including two Oilgear hydraulic pumps, driven by a single 2-hp. motor, which is readily accessible through large doors at the end.

Each carriage is mounted on a 5-in. and a 6-in. diameter steel bar, the former on the outside and the latter on the inside. The 6-in. bars are anchored in the head and tail housings, while the 5-in. bars are slidably mounted in bushings in the same housings, the carriages being clamped to them. This provides wide area of support and prevents cocking or twisting of the carriage under heavy cuts.

Tool slides are supported on two round hardened steel bars and have split adjustable taper bushings to compensate for wear. The cross-feed hydraulic cylinder is located between the two tool slide supporting bars. Either tool slide can be reversed instantly and returned to the starting position from any point in the cycle. The tailstock clamps on the two inside 6-in. diameter bars on which the carriages slide.

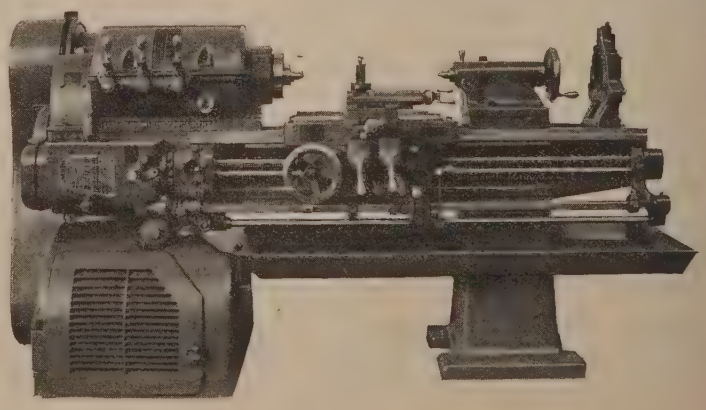
The hydraulic feeds provide unusual flexibility, and because of their cushioning effect more pieces are produced between tool grinds. Quicker set-up and change from one job to another permits the machine to be used economically for short runs. It is also stated that heavier cuts can be taken than usual on a machine of this type, and the high spindle speeds and rugged construction adapt the machine for tungsten-carbide cutting tools.

Improved 14-In. Selective-Head Engine Lathe

IMPROVEMENTS intended to facilitate operation, both in manufacturing and tool room work, have been incorporated in a new 14-in. selective-head engine lathe of the Lodge & Shipley Machine Tool Co., Cincinnati. The machine is of generous size, the swing over the bed being 16½ in. and over the carriage, 10½ in.

Twelve spindle speeds are obtainable through gears sliding on splined shafts. There are only 12 gears, all of which are hardened. In addition to the spindle, there are only two shafts in the headstock, and these are carried on ball bearings. All of the mechanism is located in the lower section of the headstock. Gears run in oil, the splash system being supplemented by a pump that drenches the entire interior of the headstock, including the white-metal spindle bearings. The headstock pulley has an improved type of disk clutch, which is operated by levers at the apron and at the headstock. A new feature is the reverse to the lead-screw operated by a lever at the right of the apron. The lead-screw and feed rod can be thrown out of use through a clutch at the feed box end so that only one of these members is operating at one time.

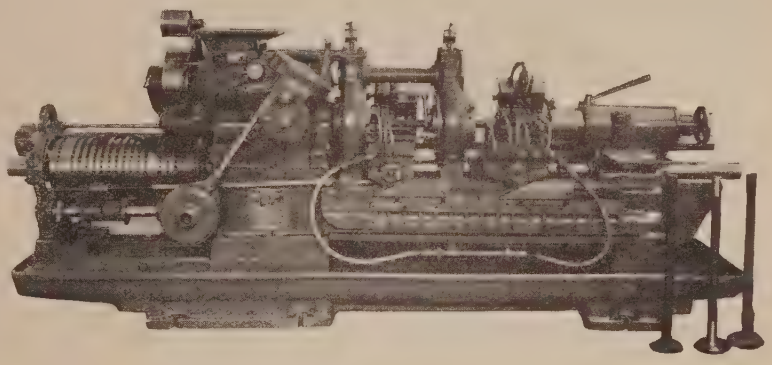
The motor base of the machine houses the motor at the rear, and a compartment, reached through a large door at the front, incloses the starting equipment. An automatic belt tightener of weighted idler pulley type is provided for the flat belt that connects the motor and drive pulleys.



Fay Automatic Lathe with Center Drive

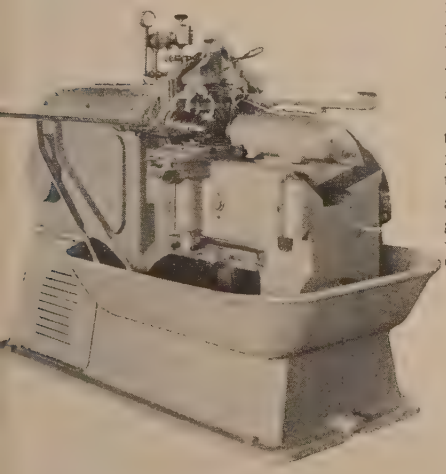
A 14 x 50-in. Fay automatic lathe equipped with center drive, as illustrated, and tooled to machine both ends of a rear axle shaft simultaneously, will be demonstrated by the Jones & Lamson Machine Co., Springfield, Vt.

Two of the new 24-in. Fay automatics, described at length in THE IRON AGE of May 2, will also be shown for the first time. They will be tooled for roughing and finishing operations, respectively, on a large tractor shaft, and will show the possibilities both in removing a large amount of metal and in holding the work closely to size. A new 2½-in. turret lathe that is similar to the company's 2-in. machine but is for larger work will also be under power. A 15-in. turret lathe will be tooled for first operation work on forged steel gears and a 14-in. Fay automatic will be shown in second operation work on the same gear. Another 14-in. Fay automatic will be tooled for finning airplane cylinders.



Lathe Machines Pistons at High Rate without Operator

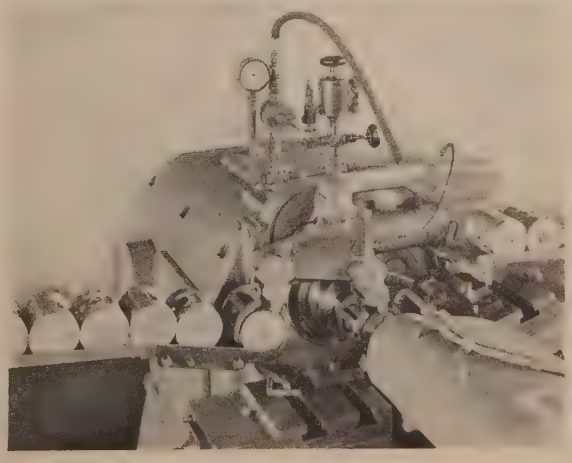
ROUGH turning, grooving and facing of aluminum automobile engine pistons at a high rate and without an operator will be demonstrated by the Seneca Falls Machine Co., Seneca Falls, N.Y., with its new model U Lo-Swing automatic lathe. This machine without the automatic devices was described briefly in THE IRON AGE of June 20.



All operations, including loading and unloading, are completely automatic, the machine when started continuing to perform until stopped. The piston is picked up from the runway by a "hand" and placed between an air-operated tail center and a dowel center that fits into the open end of the piston. The tool-holding slides then move into position, and the tools in the front slide or carriage perform the turning operation, while those in the rear slide groove, face and form. Upon completion of these operations the piston is removed and deposited by another "hand" on the runway on the opposite side of the machine, and is carried to the machine that performs the next operation. Simultaneously with the removal of one piston another is taken from the runway and placed in the machining position.

The loading and unloading mechanism, as well as the tailstock center, is pneumatically operated and controlled by adjustable cams that operate the air valves. The two sets of gripping fingers are designed to simuate the action of the human hand. The time for removing and loading the pistons is approximately 3½ sec., and the tools withdraw and begin the next cut simultaneously with loading.

As outlined in the previous description, this lathe is self-contained, the entire drive, including motor, and the feeding mechanism being inclosed within the machine. All shafts are mounted on ball or roller bearings and careful attention has been given to lubrication and coolant supply. Floor space occupied is only 3½ x 6 ft., and the rigidity and weight of the machine, 5000 lb., is intended to permit use of tungsten carbide or other high-production alloys. Although developed for turning and machining pistons, the lathe is adapted for a wide range of cylindrical work up to 5 in. in diameter.



High-Speed Short-Bed Production Lathe

A NEW 12 x 18-in. production lathe, designed to use tungsten-carbide as well as high-speed steel tools, will be demonstrated by the Porter-Cable Machine Co., Syracuse, N. Y.

In general design, this machine, named the "Carbo-Lathe," is similar to the short bed lathe previously built by the company, but is heavier, has a Timken roller bearing spindle, ball-bearing shafts and a No. 3 Morse taper high-speed steel tailstock center. It is designed for high production turning and facing operations on pieces up to 7 in. in diameter. Spindle speeds depend upon the speed of the motor, the diameter of motor and drive-shaft pulleys and the speed change gears used, the range being 42 to 1500 r.p.m.

The machine is made up of but four major parts. The bed and headstock are in one piece, this casting being of chrome-nickel high-test iron. The tailstock, also in one piece, weighs approximately 100 lb., and it is clamped rigidly to the bed by two draw bolts. The ways are relieved in the center to provide two-point contact.

When furnished for motor drive, a 3 or 5 hp. motor is mounted on a hinged plate in the one-piece cabinet base, the mounting being such that the weight of the motor automatically takes up belt slack. Two-speed motors may be used on the machine. From the motor, the drive is by 3-in. belt to a ball-bearing disk clutch pulley on the drive-shaft; from the drive-shaft the power is transmitted to the spindle through helical and worm gearing, and to the carriage, through spur and worm gearing. Carriage pick-off gears provide five feeds, ranging from 0.005 to 0.030 in. A brake, controlled by the lever that operates the clutch, is provided for stopping the spindle.

Chips and lubricant fall through the center of the bed, and as there are no flat spots on the bed ways, piling up of chips under the carriage is eliminated. Zerk lubrication is provided, and the coolant system is arranged so that the flow is shut off automatically as the spindle stops. The machine occupies 34 x 48 in. floor space and is 48 in. high overall. The height to center of spindle is 42 in. A complete line of attachments can be furnished.

Grooves and Slits 300 Ball Yokes an Hour

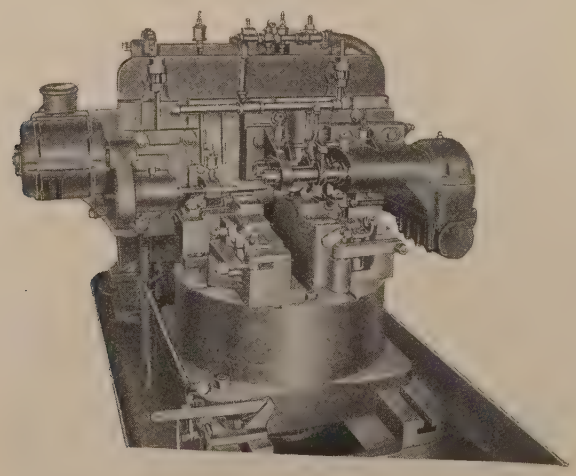
SLITTING and grooving of ball yokes for automobile universal joints at the rate of 300 pieces an hour will be demonstrated by the Producto Machine Co., Bridgeport, Conn., on its No. 50 Producto-Matic milling machine. The machine is arranged for motor drive and with vertical as well as horizontal travel of the cutter. The two operations, at right angles to each other, are done simultaneously.

The machine has a built-in four-station flat-turret type work-holding fixture, and when in operation two stations are in the milling position and two in the loading and unloading position. In the first milling position the slitting operation is performed by a double-spindle cutter block in tandem, having two saws on each cutter spindle. For the second operation the table indexes 90 deg. and the piece then grooved by means of an auxiliary cutter spindle mounted on the cross-slide of the machine and is driven by a separate 1 hp. motor. This miller is intended to eliminate the necessity of two machines and with it rehandling of the work, without any sacrifice in production. It is adapted for a wide range of pieces that require two milling operations at right angles to each other.

Cam Miller Adapted for Variety of Contour Work

A new motor-driven automatic cam milling machine, designated as the No. 12, will also be shown by the Producto company, in milling the contour of a cam used in an automobile four-wheel type expanding brake. Production is at the rate of 60 pieces an hour. Under usual conditions one man should operate three machines.

This is a single-spindle machine with the work-slide and the cutter-slide operating independently by means of two master cams. New features include flat box-type work and cutter slides, as well as the arrangement for bringing the work slide and the cutter slide together automatically at the beginning of the cut and allowing both slides to feed in opposite directions at the end of the cut so that the work may be removed easily. A new type of air cylinder for holding the work is used. The machine is adapted for milling radial airplane engines, timing cams, and other contour work that can be revolved in relation to the cutters.



New Large Turret Lathes

THE Warner & Swasey Co., Cleveland, will have in operation at the Cleveland Show a No. 5-A universal hollow hexagon turret lathe and a No. 5 universal all-geared head turret lathe. Both machines incorporate new features.

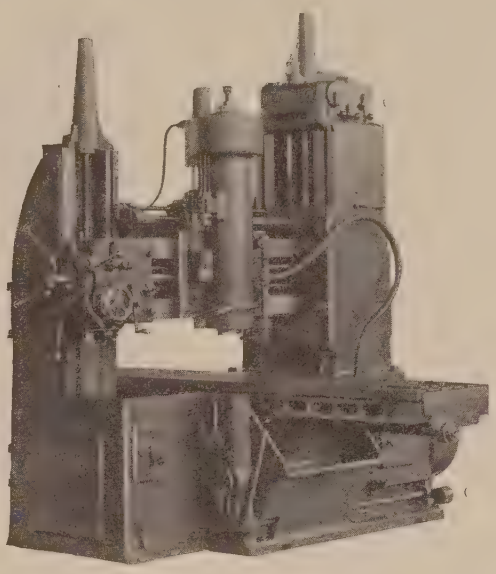
The No. 5-A lathe, the largest machine ever built by the company differs somewhat in construction from other Warner & Swasey heavy-duty "A" type turret lathes. The No. 5 universal is a ram-type machine of 2-in. bar capacity, and was designed to fill the gap between the No. 4 universal and the No. 1-A. A new hexagon turret saddle construction adds rigidity and tends to prolong the accurate life of this unit. The 5-A turret lathe will be demonstrated in machining flywheels, while the No. 5 machine will be in operation on shafts.

Bridge Type Vertical Milling Machine

THE Kearney & Trecker Corporation, Milwaukee, will have in operation a new bridge type vertical Mil-Waukee-Mil machining crankcases for Wright airplane engines. The machine is intended for face milling, die sinking, routing, profile milling and other operations on work having surfaces to be milled at various planes and levels. Saving in machining costs is claimed.

The company's 2200 series Simplex bed is used. The table is 22 in. wide and can be furnished for any length of feed from 3 to 11 ft. Housings are spaced to accommodate work up to 46 in. in width. The bridge or rail is arranged for power operation at the rate of 25 in. per min., and when adjusted can be rigidly locked in position. It has a total movement of 17 in.

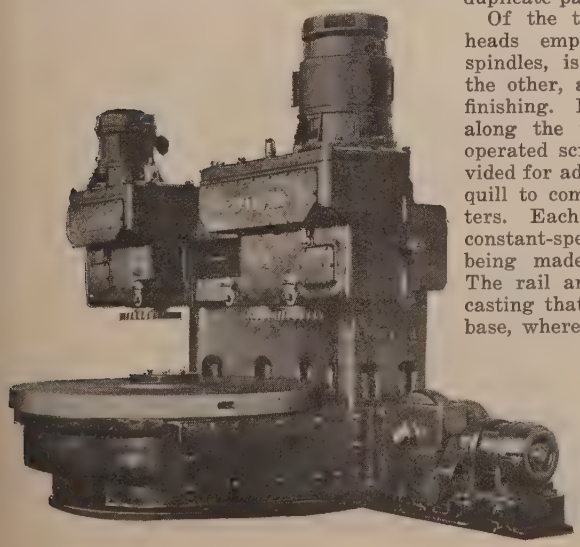
The saddle that carries the vertical ram and spindle can be traversed a distance of 24 in. across the rail, by power feed or rapid traverse, and means are provided for making close hand adjustments of the saddle. The power feed for the saddle is through the standard feed box furnished with all Mil-Waukee-Mils and is the same at all settings as the table feed. Both the saddle cross feed and the table feed may be engaged at the same time for diagonal milling. Trip dogs stop the feed or rapid traverse at any point along the bridge.



Power down feed of 7 in. is provided for the spindle ram, in addition to means for both quick and slow hand movement. Four-position micrometer stops and indicator dial can be furnished for the ram. Spindle drive is through a standard Mil-Waukee-Mil speed box on the top of the main upright, and may be through pick-off gears or quick-change gear box. Hand crank adjustment of the table through stationary screw and revolving nut is provided. The bridge can be securely locked to both uprights and the saddle to the bridge and, as a further facility for accurate boring, a lock is provided for the table. The spindle is driven by a large herringbone gear and anti-friction bearings are used throughout this drive. Lubrication of the machine is automatic.

Large Rotary Miller for Production Operations

MANNING, Maxwell & Moore, Inc., New York, will have in operation a 72-in. Putnam rotary continuous milling machine, equipped for production milling in automobile and other plants having large numbers of duplicate parts to be machined.



Of the two Putnam unit milling heads employed, one, having two spindles, is used for roughing, and the other, a single-spindle head, for finishing. Both heads are adjustable along the rail by means of hand-operated screws, and means are provided for adjusting the position of the quill to compensate for wear of cutters. Each head is equipped with a constant-speed motor, speed changes being made through change gears. The rail and column is an integral casting that is unusually wide at the base, where it is attached to the bed casting. The rotary table has angular bearings and two flat bearings. It is driven by a worm wheel located inside of the outer flat bearing, the worm wheel being cut so that the pressure is always down on the bearings. The table feed is actuated by a separate motor and may be varied by means of change gears. Motor controls are so arranged that the failure of either spindle motor will automatically stop the table feed. Power loss from the motor to cuttter is minimized by locating the motor on the head and by the use of roller bearings and heat-treated helical gears in the drive.

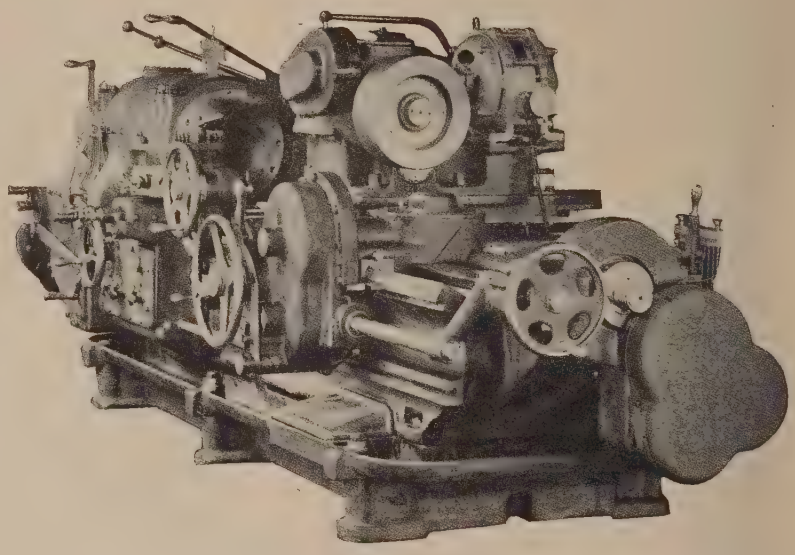
The unit milling head developed by the Putnam organization is also made with a multiplicity of speeds to meet the requirements of a more general service machine. It may also be furnished with a multiplicity of feeds, both for moving the quill in and out of the head and feeding the head along the rail, as well as with rapid traverse for both the quill movement and the heads.

Thread Miller for Oil Well Tools

THREADS are milled on oil well drilling tools, tool joints, drill pipe, etc., in a little more than one revolution of the work on the new thread milling machine that will be exhibited by the Lees-Bradner Co., Cleveland.

For work requiring faces and shoulders that are concentric with the threads provision is made so that these turning and facing operations may be performed at the one chucking. The machine is equipped with a selective-speed headstock, apron and cross-slide, square turret tool post and with selective power feeds. The hollow spindle takes bars or tubes up to 10½ in. in diameter, and the chucks, both front and rear, may be air or manually operated.

The cutter head unit is of rigid construction to prevent vibration and is provided with power rapid approach to and from the headstock to facilitate loading and unloading. The cutter spindle is worm-wheel driven and is carried in bronze bearings having take-up for wear. Headstock and cutter head units are individually motor driven, the drive being through pick-off gears that give a wide range of speeds. A taper attachment permits both straight and taper internal and external threads to be milled rapidly and accurately.

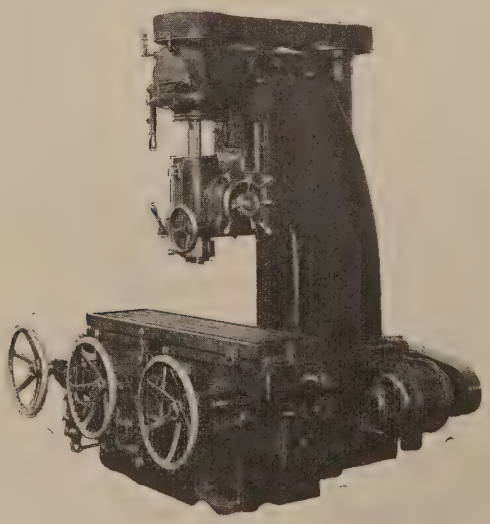


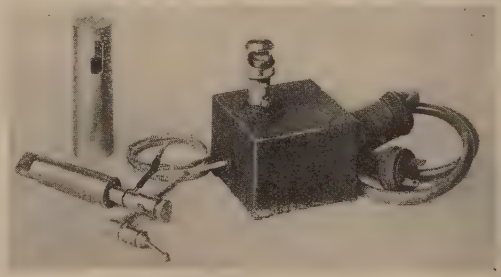
The company will also demonstrate a new heavy-duty worm and thread miller having a two-speed cutter head with reduction in the head and a quick change lever that permit making roughing and finishing cuts at one setting of the work. Another feature includes a quick-change cutter reverse mechanism between the drive shaft and cutter head, facilitating changing the direction of cutter rotation.

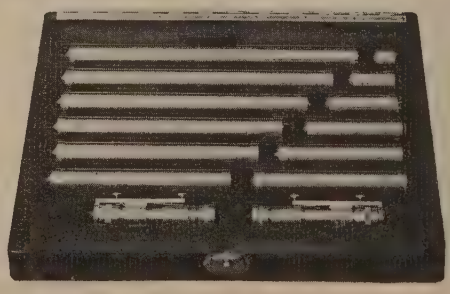
Vertical Milling Machine and Jig Borer

FOR milling die shoe bases and the recesses that take the die-block, boring out leader pin holes, and milling, drilling, reaming and boring holes in jigs and fixtures and similar work, the Reed-Prentice Corporation, Worcester, Mass., will offer a new model jig borer and vertical milling machine.

To procure accuracy in jigs and fixtures, work-brackets having V-blocks are provided for holding measuring bars and micrometer heads, shown in lower illustration, placed between the adjustable stops and the dial gages which are attached to the saddle and table. The two micrometer heads with 12 measuring bars provide







adjustments ranging from 1 to 12 in. by 0.0001 in. Holes are located accurately in either direction, cross or horizontal, with direct readings. Positioning of the table and work is controlled accurately by end measures, inside micrometers and dial indicators. A locking device is provided for fastening the table to the bed of the machine. An electrically-operated indicator, illustrated, facilitates setting the work accurately in line with spindle. This mechanism consists of an electric bulb operated from a light circuit with transformer connection.

The table working surface is 16 by 60 in. The machine has a longitudinal power feed of 48 in. and cross-power feed of 16 in. The vertical adjustment of the head on the column is 15 in. and the vertical feed of the spindle 9 in. The maximum distance from the end of the spindle to the table is 20 in. The depth of throat is 20 in., while the distance from center line of the table to the face of the column is 11¼ in.

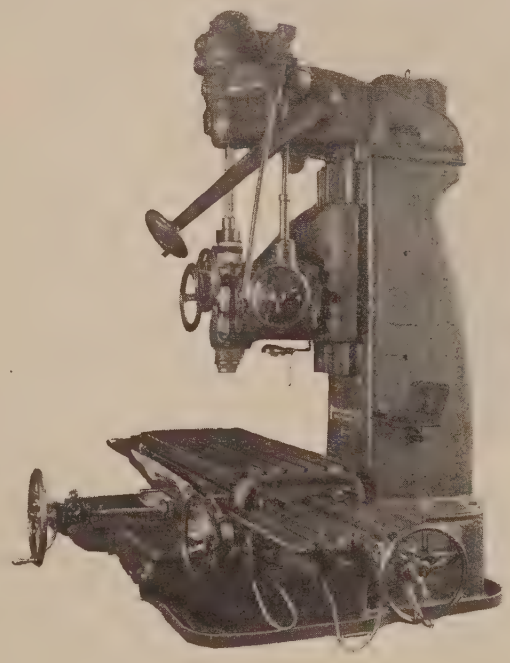
Eighteen spindle speeds, ranging from 17 to 600 r.p.m., are obtainable. Each speed has eight feeds, giving a range of feeds from 0.002 to 0.297 in. Longitudinal and cross-feed rapid power traverse in either direction is at the rate of 100 in. per min. Timken roller bearings are employed.

Adds Large Machine to Jig Borer Line

LARGE jig borers, designated as the Nos. 3 and 3A, will be among the new equipment shown by the Pratt & Whitney Co., Hartford.

The machine is similar to the company's smaller jig borers and embodies the same fundamental system of locating, using end measures, inside micrometers and dial indicators. It is also the same in locating to tenths, boring where it locates, and then checking to tenths without changing the work setup. Deviations from true accuracy are shown instantly on the dials.

The table is of increased size, and the open side construction gives a still greater size range. The machine is heavy, and means are provided for moving the table and work smoothly and quickly. A linear scale has been added so the larger dimensions can be rough set rapidly. Electrical improvements include lights over each dial indicator and above the work. The motor itself has four speeds, giving eight spindle speeds with the back gears. Shift from high speed to low is made in one movement of a single lever. A wide range of both hand and power feeds is provided, and the speed and feed combinations adapting the machine for rapid drilling, boring and reaming operations. Other features include force feed oiling throughout, Maag gearing and broad bearing surfaces.



Inserted-Blade Milling Cutters

GODDARD & Goddard Co., Detroit, will introduce a line of inserted-blade cutters that includes small facing cutters (shell end mills, etc.) from 3 to 7 in. in diameter; right and left-hand spiral facing cutters, from 8 to 20 in. in diameter; right and left-hand spiral straddle mills from 4 to 20 in. in diameter, and alternate-tooth cutters ranging from 4 to 8 in. in diameter, and from ½ to 1 in. in width.

Only 11 sizes of blades are required for the maintenance of the entire line so far developed. The blades have machined serrations on the backs which mate with corresponding serrations in the body tooth slot, which arrangement is intended to prevent tipping of the blade in service. It is also stated that the blade cannot slip radially because the serrations more than double the frictional contact area in the back of the tooth, this being further enhanced by the flat wedge used in front of the blade, the area of which is approximately the whole of that available on the tooth.

The serrations which run longitudinally are spaced on a 1/16 in. pitch, so that the blade, as peripheral chip clearance necessitates, may be projected radially in multiples of that unit. Blades may be moved out longitudinally as the face chip clearance decreases.

Develops 3-In. Spiral Bevel Gear Generator

NEW machines to be exhibited by the Gleason Works, Rochester, N. Y., include a 3-in. spiral bevel gear generator, a small straight bevel gear generator and a spiral cutter angle testing device.

The small spiral bevel gear machine has capacity for gears of 3⅜-in. pitch diameter, ½-in. face, 1¾-in. cone distance at 4 to 1 ratio, the largest pitch angle that can be cut for gears mounted at right angles being 75 deg., 58 min. and the smallest, 14 deg., 2 min. The fineness of pitch is limited only by the point width of the cutter.

This machine, which employs the generating principle of other Gleason bevel gear generators, is illustrated herewith, and will be described at greater length in a forthcoming issue. Cutters are of face-mill type with the blades integral with the head, and are made in four standard diameters, from ½ to 2 in. The smallest cutter has two blades, and the others have four. The cutters are made with alternate inside and outside cutting blades so that both sides of a tooth slot are cut simultaneously and the gears finished from the solid. The cutters are set up to the proper cutting position by a gage. An improved feature is a lever actuated quick throw-out mechanism which enables the cutter slide to be moved instantaneously to or from the cutting position for loading.

The straight bevel gear generator, to be described later, is a companion machine to that briefly described above. It differs from the spiral generator chiefly in that it employs two reciprocating tools instead of the circular type cutters.

Spiral Cutter Angle Testing Device

The new testing device, also illustrated, is used as a comparator to insure that the blades, in the circular cutters used on Gleason spiral bevel and hypoid gear-cutting machines, are mounted so as to have identical cutting pressure angles. The blades now being sold separately from the cutter heads, it is essential that they be carefully checked after being assembled in the head, because a slight variation in the angle of blades will cause flats to be cut on the teeth.

The device includes an indicator, a cutterhead carrier against which the cutter is held by spring pressure, and a dovetail slide on which the carrier is angularly adjustable. The motion of the slide on the base of the fixture is such that the blades in the cutter can be moved back and forth under the indicator finger. The cutter to be checked is placed on the carrier, which is then adjusted so that the indicator shows zero when the slide carries one of the blades to its full working depth. The next blade is then rotated into position under the indicator and moved back and forth.

If correct, the indicator will read zero for the full working depth of this blade; if not, the cutter is locked against rotation and the blade readjusted. A reading is thus taken on each blade and any adjustment necessary made so that all the blades will cut alike.

Both inside and outside blades can be checked, and the cutter-head carrier has a wide range of angular adjustment for covering the full range of pressure angles. The device is built in two sizes, one for 9-in. and the other for 12-in. cutters.

Cutter For Milling Large Castings or Forgings

HEAVY-DUTY face milling cutters taking facing cuts of ¼-in. deep and 9-in. wide at a feed of 30 a min., pulling 35 hp., will be demonstrated at the Cleveland Show by the O.K. Tool Co., Inc., Shelton, Conn. This tool incorporates the O.K. cutter blade of the tapered serration type, thicker than heretofore, and is designed for use in milling large castings or forgings where considerable finish or variation of cuts is encountered. The blade is of drop forged high-speed steel, inserted into a forged and heat treated chrome-nickel steel body.

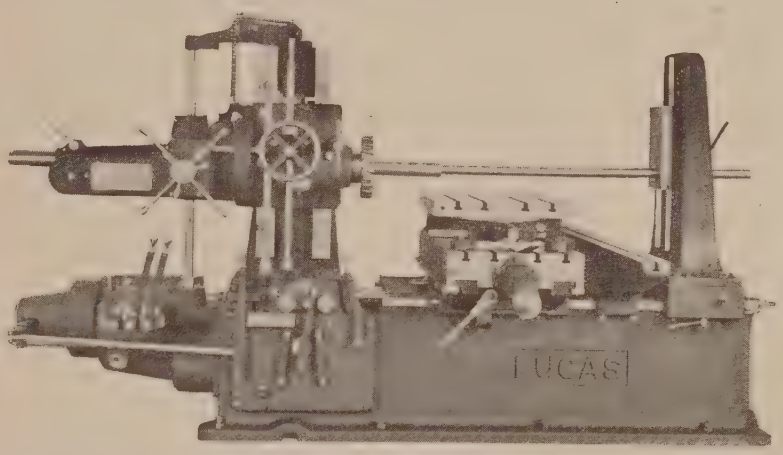
A new development in single point tool design with a holder that uses the O.K. cutter blade will be shown. This holder, available in plain, offset, straight, angular boring and other types, is said to be practically a solid tool, so far as overhang and rigidity are concerned, but retains the renewable cutting bit and is adjustable. A new offset side lock holder, developed to permit use of an O.K. tool holder for multiple tool operations in the turret tool post, may also be seen.

In addition to the above items, the company will exhibit its entire line of lathe, planer, shaper and boring mill tools, milling cutters, boring and facing heads and hollow mills, including multiple-operations tools.

New Model Horizontal Boring Machine

THE Lucas Machine Tool Co., Cleveland, will demonstrate its new model No. 41 "Precision" 3-in. spindle horizontal boring, drilling and milling machine.

Compared with its predecessor, the No. 31, this machine is heavier, more rigid and more powerful. Its bed is wider and has leveling screws in the lower flange to facilitate accurate setting up. The saddle has been made longer and has automatically equalized clamps that are operated simultaneously by a ratchet wrench at the front of the machine. More efficient means of clamping the spindle head has also been provided, and cramping of the platen is minimized by a long narrow guide with taper gib.



The speed range of the machine has been widened and the number of changes increased 50 per cent, providing smaller increments of speed. Automatic lubrication is by means of a pump in the driving gear box and oil rings on the spindle. Controls are located more conveniently, and safety features, such as additional limit trips, have been added.

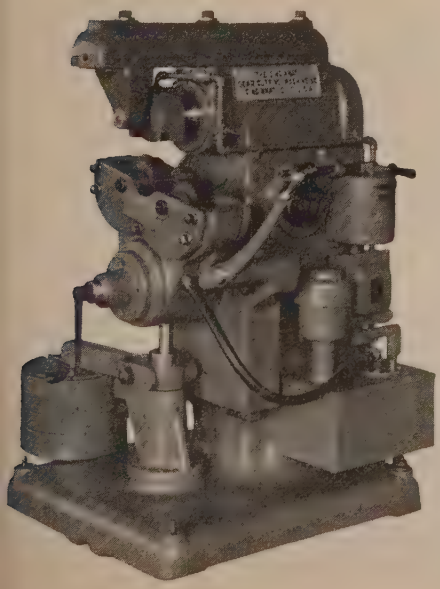
Larger machines in the "40" series, namely the No. 42, having a 4-in. spindle, which will also be exhibited, and the No. 43 with 5-in. spindle, have the features noted above, and, in addition, are arranged so that cross adjustments of the table may be made from both the left and right-hand sides of the front of the saddle.

A new self-contained square swiveling table, designed to provide greater clamping surface and to support the work better on its edges, has been developed for these machines. It is mounted on a baseplate and may be used interchangeably on different machines. Graduations are in half degrees, and a lock bolt for four positions, 90 deg. apart, is provided. Swiveling is facilitated by an elevating ball thrust bearing that lifts the table slightly off the baseplate during the swiveling operation.

Gear Burnisher with Extended Range

A NEW gear burnisher with standard range extended to handle gears up to 12 in. in diameter, but which may be arranged to take even larger gears, will be shown by the Cincinnati Shaper Co., Cincinnati.

The method of counterweighting is a feature. The pressure with which the burnishing gears engage the "green" gear is fixed by means of these counterweights which permit sufficient movement of the carriage slide to compensate for any small variation in the pitch diameter of a run of gears.

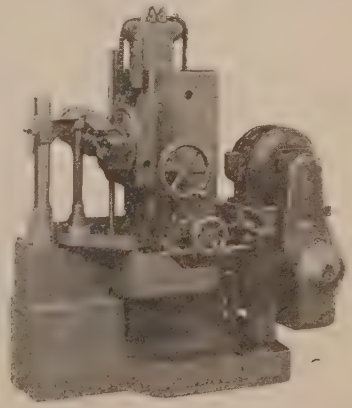


Operation is entirely automatic. After placing the "green" gear between the master gears, the operator pushes a lever to bring the "green" and master gears into engagement, and then throws the starting switch. The spindle makes a predetermined number of revolutions in one direction, the same number in the reverse direction and then stops automatically. The burnishing time can be varied from 5 to 6 sec. up to 30 sec. or more.

Small Manufacturing Type Gear Hobber

IN addition to a new 36-in. manufacturing shaper, and a new 48-HS and 48-HL manufacturing gear hobber, Gould & Eberhardt, Newark, N. J., will show a new small hobbing machine designated as the 9-H manufacturing type. It is designed for generating fine pitch and small diameter spur, helical, herringbone and worm gears, producing gears up to 9 in. in diameter with the arbor support in place, and gears up to 12 in. in diameter with the support removed, and is rated for 10 D.P. in steel. The weight of the machine is approximately 2800 lb.

The cutter slide is adjustable for depth and diameter of gears to be cut, and may be swiveled 180 deg. for either right or left-hand helical gears of any angle. The cutter arbor is portable to permit using arbors of different diameters and to accommo-



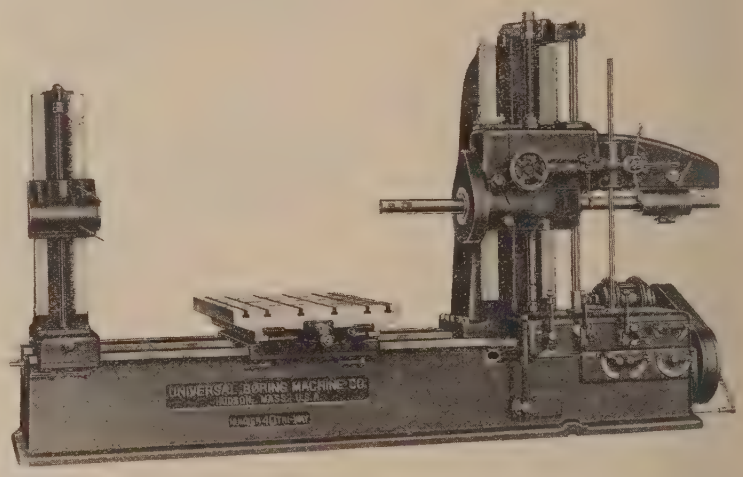
date small diameter solid-shank hobs. The work table is fixedly located and mounted on anti-friction bearings directly in the base casting. The hardened and ground indexing worm engages with a chilled cast iron wheel. The work arbor is of single post type with an adjustable arm that can be locked in any position. Lubrication is by both pressure and gravity systems.

The new 48-HS and 48-HL manufacturing type gear hobbers, also to be shown, are rated for 2 D.P. in steel and have capacity up to 32 in. diameter with the arbor support, and 57 in. diameter without the arbor support.

Improved Horizontal Boring Machine

THE Universal Boring Machine Co., Hudson, Mass., will exhibit an improved No. 40 Tri-Way, universal (horizontal) boring machine. The Tri-Way bed has been retained, but gear boxes have been redesigned, and now incorporate ball bearings throughout the speed-box mechanism, as well as multiple splined-shafts. The head assembly is also a new design, having ball bearings throughout the drive mechanism, the spindle itself being mounted on Timken roller bearings. A six-splined ball-bearing vertical drive shaft transfers the power from the gear box to the head. Motor drive, but without motor, is standard equipment.

Specifications are as follows: Main Boring bar, 4 in. diameter, No. 6 Morse taper; distance between face-plate and outer support, 96 in.; vertical travel of head on column, 40 in.; and maximum distance from top of table to center of bar, 42½ in.

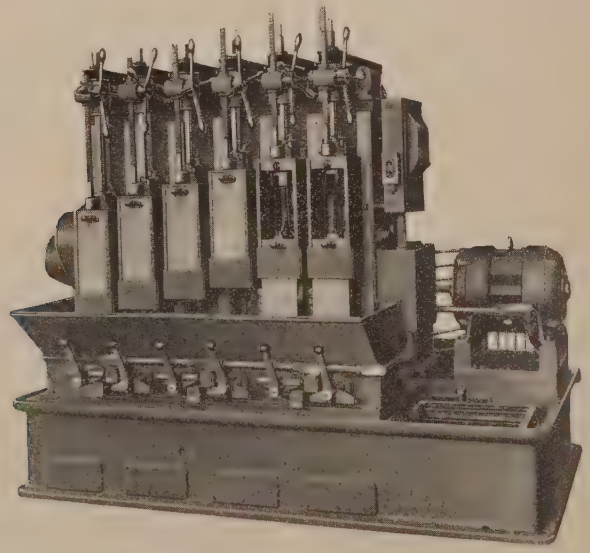


The table is 40 x 63 in., and has 48 in. power cross feed. The spindle speed range is 8 to 300 r.p.m., the milling feed range is 0.53 to 11 in. per min., and the boring feed range from 0.13 to 2.7 in. per min. The approximate shipping weight is 28,000 lb.

Multiple-Spindle Vertical Deep-Hole Driller

THE Pratt & Whitney Co., Hartford, Conn., will exhibit, among other new machines, a six-spindle vertical deep-hole driller using the rifle-barrel method of drilling. Accuracy and rapid production are features, and being of vertical design, floor space is saved. The machine has been employed to advantage in the automotive industry in drilling deep holes the length of a connecting rod to the wristpin, and is adaptable also for drilling the tell-tale holes in stay-bolts for locomotive boilers and for other deep-hole jobs.

The heavy cast iron bed, containing an oil reservoir, has a rigid column mounted on it. This column carries the six work spindles and slides and their individual driving mechanisms.



The six drills, which remain stationary, are mounted vertically on the bed beneath the spindles. At rear of the bed are six high-pressure oil pumps, one for each drill, and all driven from one 15-hp. separate motor.

Slides carrying the work fixtures are counterweighted and are scraped to ways on the front of column. Their spindles rotate the work in the fixtures at proper speed for drilling. The six slides thus feed down independently under power and carry the rotating work to the stationary drills. Each spindle may be operated without relation to the others. Each spindle unit has six ball bearings, two on the upper part of the spindle, two on the upper work-holding fixture attached to the spindle and two in the lower work-holding fixture.

Each drill consists of a hollow shank to which is brazed a short high-speed steel drill tip. Oil is forced to the drill tip under 500-lb. pressure, inside the shank, and returns outside through a groove in the shank. This method of handling is economical of drills, as oiling keeps them cool; the shank is inexpensive and sustains all twisting damage in case the drill meets a hard spot or becomes jammed. The expensive tip can be re-brazed to a new shank and reground as necessary until it is used up.

New Multiple-Spindle Drills Equipped Either with Mechanical or Hydraulic Feeds

TWO new vertical multiple-spindle drilling machines, both designated as the No. 16, one with mechanical feed and the other with hydraulic feed, have been developed by the Foote-Burt Co., Cleveland, for work that is too heavy for its former machines.

The No. 16 drill with mechanical feed has 16-in. ways, while the No. 16 hydraulic machine has 20-in. ways, as well as a wider column, to accommodate the cylinder. While adapted for a wide range of application, each machine is built around the particular job on which it is to be used. The base, upright and drive bracket are standard units, but the table, head, drive and feed and speed arrangements are varied to suit requirements.

Although designed to slide on the ways of the upright, the standard table is usually held in one position by spacer blocks between it and the base. All spindles have ball thrust bearings, and can be equipped with adjustable collets so that vertical adjustment can be made on individual spindles. The head is lubricated by force feed system, the oil being carried in the head and circulated by a pump on the head. The motor drive includes a device that protects both the motor and the machine in case the latter should be stalled. The motor is geared to the horizontal shaft in the upper housing, from which the drive is through a pair of spiral bevel gears to the head drive shaft.

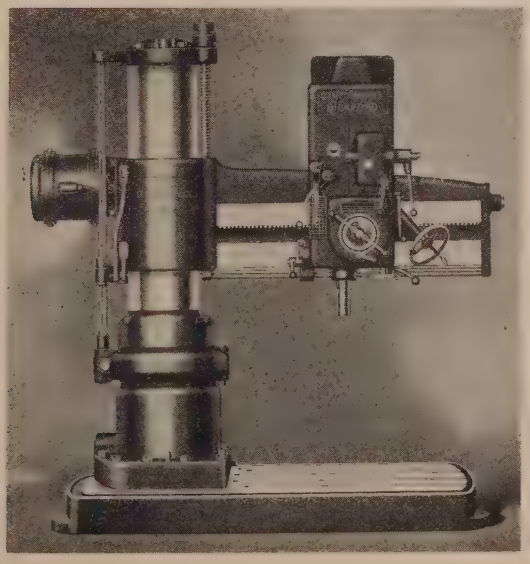
Feed for the No. 16 mechanical is taken from the main horizontal shaft through a pair of small pulleys to a worm and worm gear set, then carried through the vertical feed shaft to a large worm and worm gear set mounted on the feed pinion shaft. The pinion is in mesh with a steel rack on the slide. The standard length of travel is 16 in. Hand fast travel in either direction is provided.

Hydraulic feed mechanism includes an Oilgear pump and a 5 1/8-in. cylinder with 16-in. stroke. The following feeds are available: Fast traverse forward at 175 in. per min.; No. 1 and No. 2 slow feeds forward at 1 to 13-in. per min., each; Neutral; No. 1 and No. 2 slow feed return at 1 to 13 in. per min. each; and fast traverse return at 250 in. per min. Feed is engaged by hand lever on the side of the machine, and feeds are automatically controlled throughout the cycle by dogs on the head slide. Delayed reverse action can be obtained if desired.

Radial Drill Features Centralized Control

COMPLETELY centralized control is a feature of a new 11-in. column Super-Service radial drill to be shown by the Cincinnati Bickford Tool Co., Oakley, Cincinnati. The machine is built with 3 and 4-ft. arms and with 24 speeds, ranging from 29 to 1850 r.p.m., in the head.

All speed and feed changes are made in the head through selective sliding gears, tumbler gears, loose keys, and dive key mechanisms having been eliminated. Column clamping is also controlled from the head, and the arm is raised or lowered and clamped or unclamped by means of levers near the spindle. An interlocking arrangement prevents raising or lowering the arm while it is clamped, but when unclamped the arm may be elevated or lowered easily through multiple disk clutches which run in oil.



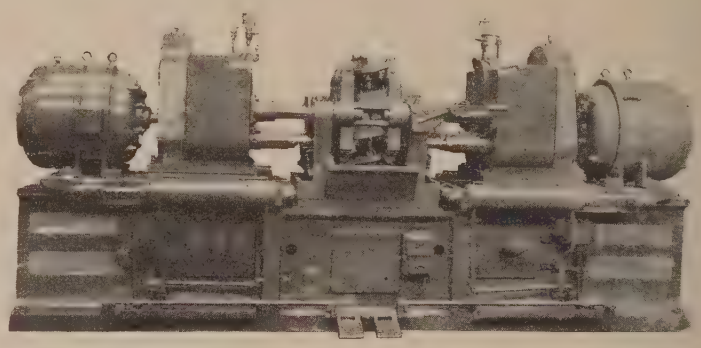
To most effectively resist combined bending and torsional stresses due to feed pressure, the arm is of full box section and has no openings in the front or rear wall, such as were formerly regarded as a foundry necessity. All rotating parts such as arm shaft and clutches are entirely inclosed. Lubrication has been designed so that the machine operates over a long period without oiling. Clutches run in oil and gears and bearings are flooded with filtered oil. The entire drive from motor to spindle nose is mounted on ball or roller bearings.

A rapid hand traverse for the head has been developed. The head is supported by an adjustable roller bearing gib, or a hardened steel arm-way, this being a patented feature which permits the head to be moved rapidly and easily. All shafts are ground and multiple splined with integral keys. Only one motor, of constant-speed type, is required for the machine.

Hydraulic Feed Machine Drills Steering Knuckles

DRILLING of two steering knuckles simultaneously will be demonstrated by Baker Brothers, Inc., Toledo, Ohio, on a horizontal machine having separate hydraulic feed for each head and individual motor drive for each spindle.

The base, built on the unit plan, is in three sections, the middle one of which may be made in various lengths to accommodate fixtures for various sizes of work to be drilled or bored. Each of the base end sections carries a head that is fed toward the work by separate Oilgear pumps and cylinders, the traverse engagement of each head being controlled by foot pedals. The feed has the characteristic rapid advance and return of the Oilgear device, and also infinite number of adjustments of feed rate. Use of separate hydraulic pumps for each end of the machine simplifies the piping and eliminates use of an equalizing mechanism. The spindle drive motors may be mounted on the saddles, as shown, or on the heads.



This machine, designated as the No. 25 H. H., may also be equipped with one spindle for each head for work requiring boring, counterboring and other operations.

Modernized Drilling and Tapping Machine

ANTI - FRICTION bearings are used throughout the sliding-head all-geared drilling and tapping machine illustrated, which will be introduced by the Barnes Drill Co., Rockford, Ill.

This machine, designated as the No. 262, handles high-speed twist drills up to 2½ in. and will bore an 8-in. hole in cast iron. It is suitable for cylinder boring, deep hole work and tool room service. There are eight quick-change geared speeds, with lever controls extended to the front of the machine, and eight quick-change geared feeds. Speeds and feeds are clearly indicated for each setting of the control levers.

The spindle is 2 in. in diameter, is of six-spline construction and is provided with roller thrust bearing. The spindle sleeve is fitted with the company's patented dovetail rack, and use of a split bearing for the spindle sleeve, with take-up for wear, is a new feature. The cap is of Gunite material and has laminated shims. The spindle travel at any setting of the head is 15½ in., but other lengths of travel can be furnished. The regular travel of the sliding head is 19½ in. Levers for raising and lowering and clamping the head are conveniently located.

Either silent chain motor drive, or single pulley drive can be furnished. Spiral crown gears of heat-treated steel are used, and may be furnished in three different ratios. Transmission bearings are of Timken tapered roller type, and spindle thrust is taken by a roller bearing having a double set of rollers. All bearings are lubricated automatically. The distance from the face of the square column to the center of the table is 13 1/16 in. The net weight of the machine with 5-hp. motor is 3500 lb.

Heavy-Duty Turret Lathes

FEATURES that adapt the Libby type H heavy-duty turret lathe for machining modern alloy steels and for the use of high-speed cutting tools, including tungsten carbide, will be pointed out by the International Machine Tool Co., Indianapolis, at the Cleveland Show.

This machine is equipped with alloy steel heat-treated Maag gears of wide face and coarse pitch. Ball and roller bearings are used on the spindle, shafts and studs and on all machines up to and including the 10¼-in. bore, the spindle is mounted on roller bearings, two sets on each end opposed. Each machine has 77 sets of ball and roller bearings. With the present gear box changes in feed are made by lifting a lever and shifting a cone of gears. This enables the operator not only to change feeds quickly, but also to cut threads of different pitches without having to change gears. The rapid traverse mechanism has been improved by increasing the number and size of the disks and clutches, and the mechanism is now inclosed and runs in oil. The turret and tool post aprons are also inclosed, and the parts run in oil. The ways of the machine are hardened steel strips dovetailed and driven in from the end of the bed way and ground. Lubrication of the machines is entirely automatic.

New Hydraulic-Feed Multiple-Spindle Drill

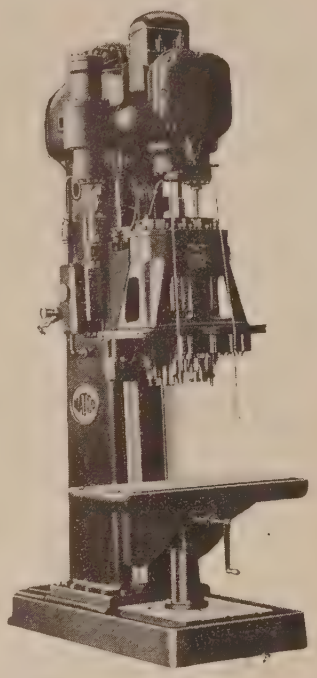
THE National Automatic Tool Co., Richmond, Ind., will show a new medium sized adjustable multiple-spindle hydraulic feed driller designed for a wide variety of work.

Base, column and other members are of rigid and heavy design, and ease of control is a feature. The hydraulic feed mechanism includes two 5-in. low-pressure oil cylinders mounted in the heavy brackets at the top of the column. The pressure in these cylinders is supplied by a constant-speed pump located on top of the column and driven from a gear on the main drive shaft; the maximum combined pressure is 8000 lb., and is applied directly to the lugs cast on the head slide. A by-pass in the pump returns excess oil to the reservoir when a predetermined pressure is reached. This arrangement protects the drills should an unusually hard spot be encountered. The feed ranges from 0 to 15 in. per min., and rapid traverse is at the rate of 90 in. per min.

Control of the feed is by means of two pendant handles, one of which is used to start the operating cycle, consisting of rapid approach to the work, feed, rapid return and stopping of the head at the starting position, all of which are controlled automatically by adjustable trip dogs. The other control handle is used to stop the head in an emergency; it causes the head to stop and return automatically to the starting position.

Three sizes of heads have been designed for the machine, a 12 x 18-in. rectangular head bored for 24 spindles, a 16 x 24-in. head with either 22 or 12 spindles, and an 18-in. diameter head bored for 12 spindles. These heads may be arranged for independent change of speed for each spindle or for a single speed for all spindles; both types have a neutral position for spindles not in use. All gears are hardened and run in oil. Drill spindles range from 1⅝ to 2⅛ in. in diameter and have vertical adjustment of 2 in.

The machine is powered with a 10-hp. 1200-r.p.m. direct-connected motor, which drives the head through heat-treated alloy-steel change gears and a set of heat-treated bevel gears. Spindle speeds range from 331 to 1940 r.p.m. on the 12 x 18 in. head and from 185 to 1019 r.p.m. on the 18-in. round and the 16 x 24 in. 12-spindle head. The machine will drive eight ⅝-in. or 24 ¼-in. drills in cast iron or six ½-in. and 14 ¼-in. drills in steel at maximum feeds of 0.004 and 0.003 in., respectively.

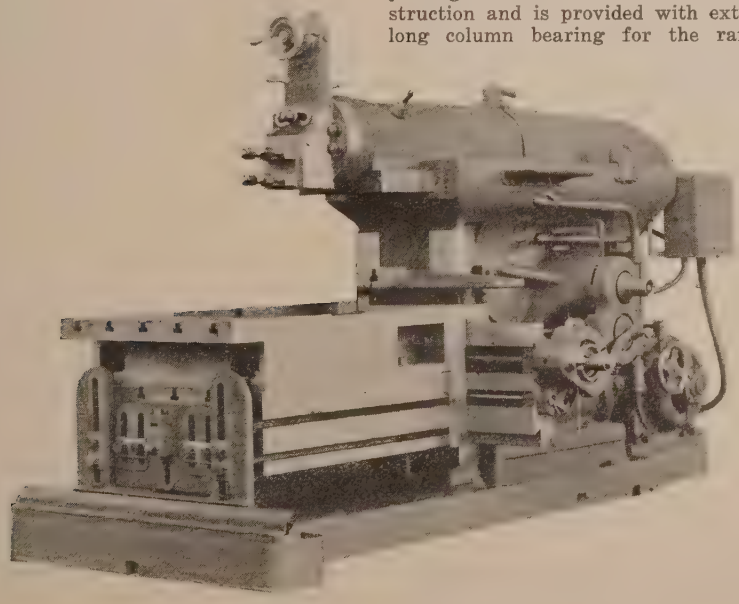


Floor space occupied by the machine is 34 x 85 in. and the net weight is 11,500 lb.

Shaper with Table for Unusually Large Pieces

FEATURING the exhibit of the Ohio Machine Tool Co., Kenton, Ohio, will be a new 36-in. "Super-Dreadnaught" crank shaper having a 48⅞-in. x 30-in. table that accommodates unusually large work and large irregular pieces that otherwise would have to be machined on a planer.

The machine is intended for use on die blocks, fixtures and all types of jobbing work. It is of massive construction and is provided with extra long column bearing for the ram, which is of double-wall box section type and is designed so that even with fully extended stroke there is 56 in. of contact between the column and the ram. The ram gibbing takes care of both lateral and vertical thrust. The large head on the ram has 13 in. diameter swivel and a 5-in. micrometer with handwheel control. The machine is equipped with a substantial table support and a jack which equalizes the weight between the table support and rail, so that alinement is preserved and the rail protected from undue wear. The bull gear and steel pinion are of herringbone type. The bull gear is of semi-steel and is in one piece. The crank arm is of steel.



All control levers are within a radius of 12 in. Automatic force feed lubrication, quick-change gears and instantaneous feed are regular features, and power rapid traverse and power elevating attachments can be furnished. A box table having top surface of 36 x 20 in., including saddle, is also made, and also a drop table that increases the maximum distance between the table and ram to 30½ in. A filler block can be utilized to fill in the drop table when the surface of a regular table is required.

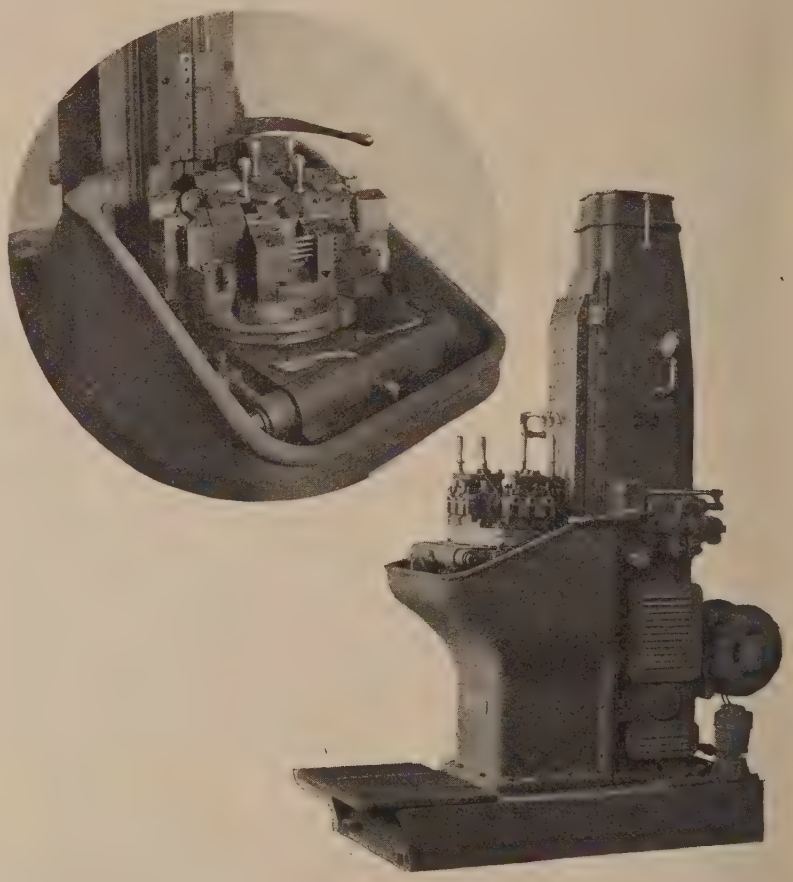
Surface Broaching Machine Roughs and Finishes in One Operation

PIECES having one of more flat or irregular surfaces may be rough and finish machined in one pass of the tool on the improved No. 1 surface broaching machine illustrated, which will be shown by the Foote-Burt Co., Cleveland. In addition to high production, minimum tool maintenance expense is emphasized.

Fixtures and broaches are designed special for each job. Four-station automatic indexing tables are usually employed, and production is set at the speed at which the operator can load and unload the work. Tiering of work, where possible, and use of one-movement clamping levers enable the operator to handle a large number of pieces.

Reciprocating movement of the broach is accomplished by means of a motor-driven hydraulic pump. Slow cutting speeds, averaging 10 to 40 ft. per min., and solid support of the broach minimize tool maintenance expense, the tool being used continuously for several days, in most cases, without regrinding. The broach has a large number of teeth and the depth of cut is evenly distributed, so that individual teeth are not burdened and dulled. The lower teeth are roughers and remove the major portion of the metal; the upper teeth do the final finishing and are never used for roughing. This arrangement makes for close accuracy, as well as for long tool life. The broach may be removed conveniently for sharpening; in sharpening, only the edges are touched up.

The broach holder is securely fastened to the broach slide, which, in turn, is bolted to the lower end of the hydraulic plunger or piston rod. The hydraulic pump develops a pressure of 1000 lb. per sq. in. Direction of oil flow in the cylinder is controlled by a three-way valve operated by dogs on the slide. The speed of the down, or cutting, stroke is set to suit the work by adjusting a screw on the pump. The up or return stroke is at fast rate. The slide may be stopped or started at any point of the stroke by means of a convenient lever, or may be reversed by turning a small handwheel.



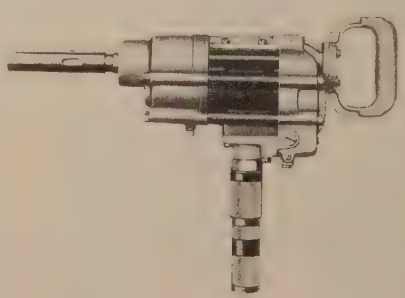
Pump, cylinder and piping are inclosed in the column, but are accessible through a door in the side. The oil reservoir is open to the atmosphere at the highest point above the cylinder, thereby eliminating possibility of air accumulation. The base of the machine forms the coolant tank. A 7½-hp. 1800-r.p.m. motor is usually recommended for the machine.

Soft steel forged 6 and 8-in. plier jaws, such as illustrated, are broached at the rate of 1200 per hour. The broach speed is 26 ft. per min. and about ⅛ in. of stock is removed. The finish is smooth and the serrations sharp.

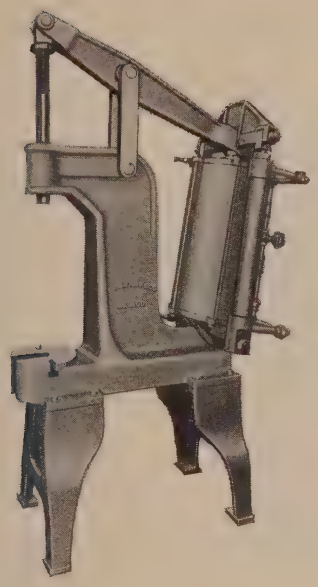
Air Tools For Production Drilling

THE Rotor Air Tool Co., Cleveland, has put on the market type E-4-C and E-40-C drills for production drilling, reaming, stud-setting and nut-setting. The E-40-C differs from the E-4-C in having a longer cylinder and hence giving more power. Speeds ranging from 200 to 600 r.p.m. are provided, covering drilling from 1 to ½ in., reaming from 11/16 to ⅝ in. and tapping from ¾ to ⅝ in. The E-4-C weighs 16 lb. and the E-40-C 17 lb.

These drills have compound gears made of heat-treated nickel steel and extra heavy ball bearings. The quick-acting governor prevents racing of the motor while running free, giving the spindle a uniform speed, prevents excessive wear and reduces air consumption. The standard Rotor motor, with only three moving parts, is used. The drills are furnished with side handle and with the usual optional equipment of breast-plate, spade-handle, eye-bolt, etc.



In addition, the company will show its new Rotor type D-0 grinder for 4 x 1-in. grinding wheels, handy for light grinding on a bench or in close quarters; its E-0 drill for high-speed production work; and its E-1-C and E-2-C drills for heavy-duty drilling, reaming and nut-setting.



Hydro-Pneumatic Broaching Press

TWO types of machine exhibited by the Hannifin Mfg. Co., 621 South Kolmar Avenue, Chicago, include a hydro-pneumatic broaching press and an air-operated rivet press. The latter will be described separately later.

Broaching operations in an air-operated press are made in this new machine by means of an application of hydraulic speed control. This avoids plunging the broach smartly into the hole, with resultant breakage. The control consists of two small cylinders, one on each side of the air-operated power cylinder.

Piston rods of the hydraulic cylinders are connected through a cast steel cross-arm to the piston of the air cylinder. Speed control is accomplished by the regulated transfer of oil from top to bottom of the oil control cylinders. During the power stroke the oil passes through a needle valve, which can be regulated to any desired speed. During the return or idle stroke the oil passes through a swing check, permitting the ram to return to top position at full speed.

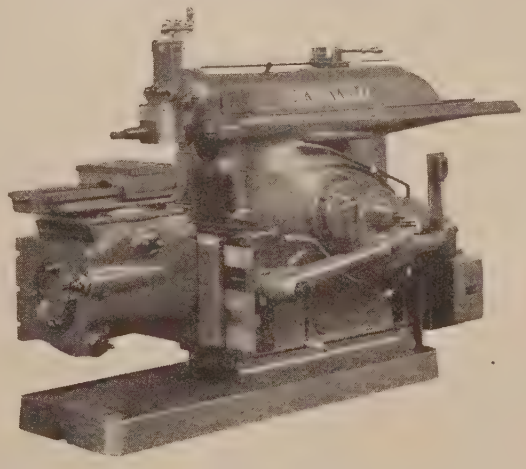
This oil-cylinder speed control results in smooth, uniform travel of the ram at any pre-determined speed without, it is said, any loss of power. The machine is not designed for broaching operations requiring broaches longer than 1 ft., but on work within its range, production is rapid.

On hydraulic shock absorbers, the hole, which must be straight, smooth, and held to close limits, output ranging from 625 to 850 an hour is claimed. The broaches used are about 6 in. long and are said to be producing 20,000 broached holes each.

Heavy-Duty Shapers with Increased Cutting Speeds

TWO new heavy-duty shapers, one 16-in. and one 24-in., with built-in power rapid traverse to the table, will be exhibited by the Cincinnati Shaper Co., Cincinnati. Cutting speeds have been increased, giving these machines the highest number of strokes of any shaper built by the company. A feature is the construction of the ram bearings: these now extend to the end of the ram and reduce overhang from the cutting tool to the ram bearing by 2 5/8 in.

The 16-in. machine will be equipped with the company's universal table, which is a revolving table with a tilting top, without hinges, jacks or table support. A new combination tool tray and cross-rail guard will be shown. Timken thrust bearings used on each end of the cross-feed screw in place of the usual bearings, are said to make the table as light as a feather to hand feed. The 24-in.



shaper, incorporating the features noted above, will be equipped with a full box table, and demonstrated in heavy, accurate cutting.

General-Purpose Marking Machines

MARKING equipment to be exhibited by the Noble & Westbrook Mfg. Co., Hartford, Conn., will include a new model No. 15 general-purpose power-operated machine, which, with suitable dies and work holders, may be used for marking a variety of round, flat, and uneven surfaces. A new No. 4 hand-operated marking machine and a No. 19 power-operated rapid production unit for marking drills and other parts of short rod construction, will also be shown.

Another new model included in the company's exhibit is the No. 41 graduating machine for graduating micrometer collars. Accuracy is secured by specially designed gears. By turning the handle a couple of revolutions, the operator can graduate the piece and mark the numbers. Specially engraved marking dies are used for rolling the graduations and figures.

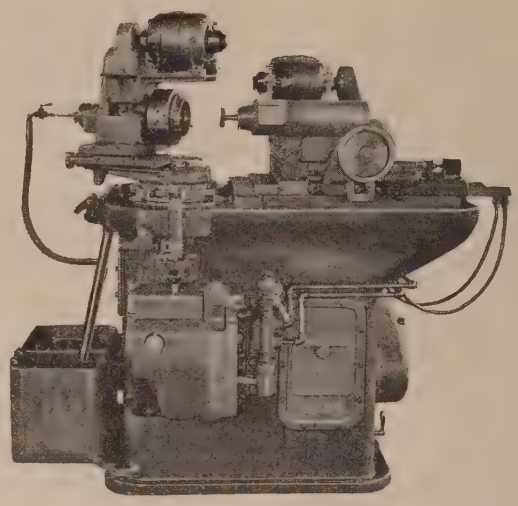
5-In. Semi-Automatic Hydraulic Ball Race Grinder

INTERNAL or external raceways or face raceways for end thrust bearings may be ground on a high production basis, on the new 5-in. self-contained semi-automatic grinder to be shown by the Landis Tool Co., Waynesboro, Pa. The machine is also adapted for other forms of radial grinding.

Hydraulic power is used for oscillating the work-head, feeding the wheel-head, and traversing the wheel-head slide. The operator merely loads the work and throws the main control lever. Work rotation, work-head oscillation and wheel carriage traversal start simultaneously. About the end of the wheel carriage movement, the wheel-head feeds in rapidly, slowing down as the wheel nears the work, and as the wheel comes in contact with the work the grinding feed is engaged. From that point on the grinding feed controls the speed of the feeding-in movement which ceases when the feed comes against a positive stop indicating that the work has been ground to size.

Throwing the main control lever in the opposite direction reverses all the movements, causing the wheel and work heads to return to their starting positions, at which point work rotation and work-head oscillation automatically stop with the head in its back position. This facilitates changing the work. One operator can run two machines.

Three specially balanced electric motors are employed. The grinding



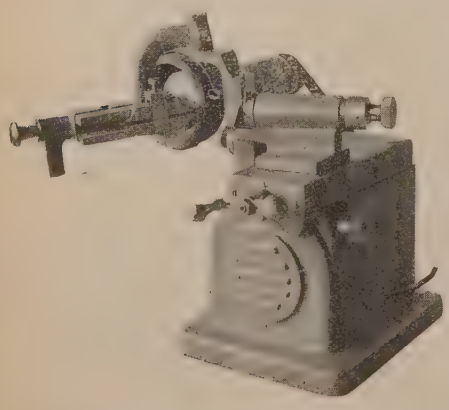
wheel spindle is mounted in adjustable steel back babbitt bearings and runs at 7750 r.p.m. The hydraulic feed movement is easily regulated, and to compensate for wear, the wheel may be fed by hand. The wheel-head slide hydraulic piston is so connected with the wheel-head piston that the movements cannot get out of time, and a hydraulic cushioning device causes both movements to come to a stop slowly, thus eliminating shock.

The grinding wheel truing fixture is attached to the front of the wheel-head only when in use. It is adjustable for different radii and is fed to the grinding wheel by means of screw with graduated dial. The vertical oscillating spindle is mounted on heavy pre-loaded ball bearings, and oscillated by a double-blade type oil motor. Adjustable reversing dogs on a ring at the top of the spindle regulate the length of arc of oscillation. The work-head may be adjusted toward the center of oscillation or at right angles to it. Work-holding fixtures may be of various designs, but the cam-operated three-finger spring-loaded type is typical.

A new 6-in. type C plain hydraulic production grinder, to be described in a later issue, will also be demonstrated by the company.

Special Grinder for 3/32 to ½-In. Drills

FOUR new machines, including a special type grinder for drills from 3/32 to ½-in., will be introduced by the Oliver Instrument Co., Adrian, Mich. The other machines, namely a face mill grinder for face mills up to 26 in. in diameter, a tap grinder, and a heavy-duty die making machine, with capacity for both filing and sawing work up to 3 in. thick, will be illustrated in a later issue.

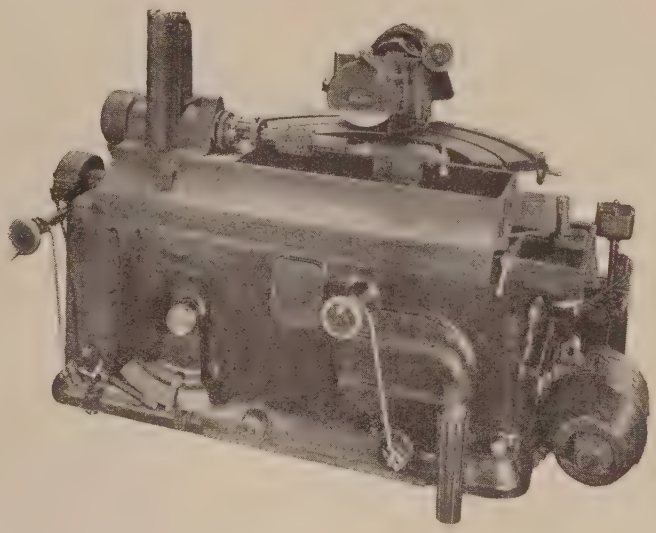


The drill grinder is designed not only for producing the Oliver type point, but also points adapted for countersinking, counterboring, chamfering, etc. Thick web oil hole drills and chamfering or nut drills can also be ground, the latter type being ground on the point and shoulder. In addition to grinding the cutting edge, the heel is backed off to give more clearance to the chips, which results in smoother holes. The point angle may be varied from 60 to 180 deg.

The drill is located in a jig or fixture which drops into position in a holding mechanism on the machine. In the bench type illustrated, the ¼-hp. driving motor is inclosed in the base and drives the spindle through a flat canvas belt, an idler providing the driving tension. The spindle is mounted on ball bearings in a swinging frame, and is adjusted horizontally by means of a knurled knob, this horizontal adjustment being for the purpose of obtaining the amount of center clearance or undercut desired so that any type of point may be ground. It also provides for grinding shoulder drills, the point being ground in the usual way and reset for the shoulder. The wheel is then moved sidewise sufficiently to come in contact with the shoulder, which is ground in the same manner as the point.

Automatic Hob and Cutter Grinder Has Wide Range

STRAIGHT and spiral hobs, milling cutters, reamers, taps and other tools are ground automatically on the new hob and cutter grinder to be exhibited by William Sellers & Co., Philadelphia. The machine will grind work up to 12 in. in diameter and 12 in. long; in addition to wide range, ease of set-up, extreme accuracy and rapid operation are features.



Indexing gears have been eliminated so that no backlash or lost motion is present, which makes it possible to grind on both the cutting and return strokes. Spiral leads to be ground on hobs or cutters are controlled by a sine bar, and by means of a patented arrangement, the machine is said to generate greater helix angles than usual. The carriage has a two-piece bottom plate so that one end may be raised if desired. It is carried on one vee and one flat way and is driven through a crank and elliptical gear, which provides uniform speed during the cut and increased speed on the reversal. The length of stroke may be varied to suit the work. Two speeds are provided for the carriage.

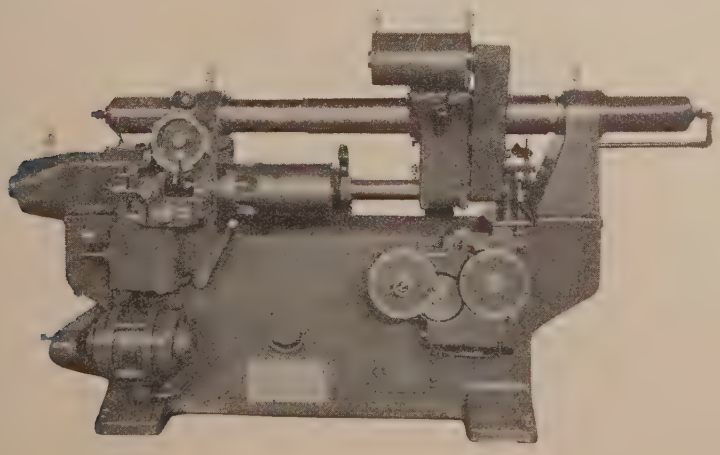
The 10-in. diameter dish-shaped emery wheel employed is driven by independent motor; it is located above the work and is carried on a series of slides attached to the main bed. The wheel spindle is mounted in ball bearings that are made to compensate for expansion due to heating. The up and down adjustment of the grinding wheel is made along a slide at the back of the bed, which is inclined at the same angle as the face of the wheel. When the stone is set at the center of the axis of the work, any vertical motion will carry the wheel radially. The grinding head is also arranged to swivel 45 deg. on either slide to accommodate helical work, and can be moved in and out so that any angle of clearance can be obtained, as well as compensation made for wheel wear.

Automatic feed includes the vertical feed as well as feeding into the wheel in a circular direction. Two 1-hp. constant-speed motors are employed, one for the wheel spindle and the other for driving the carriage and the feed and indexing mechanism. The machine is arranged to permit wet as well as dry grinding. Because of the ease of control one operator can attend several machines.

Heavy-Duty Deep Hole Automatic Sizing Grinder

FOR the production grinding of long and large bores in work that can be revolved in a fixture, the Bryant Chucking Grinder Co., Springfield, Vt., will introduce a motor-driven deep hole grinder designated as the No. 24.

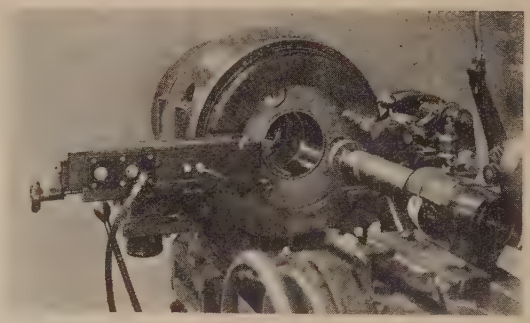
Holding to the same fundamental single slide control of previous Bryant grinders, hydraulic control, automatic sizing and massive design adapt the machine for unusually rapid and accurate production. Three sizes, having 21, 31 and 41-in. swing, respectively, and weighing 7000, 7500 and 8000 lb., net are built. The machine has a stroke of 16 in. and a grinding length of 14 in. The work spindle, of massive design, is 5¼ in. in diameter, measures more than 3 ft. between its Timken tapered roller bearings, and has a speed of 100 and 200 r.p.m. The wheel has a 2-in. face. The wheel-head is driven by a 10-hp., 3600-r.p.m. motor through a 6-in. belt. The work spindle, hydraulic pump, water pump and other parts of the machine are operated by a 5-hp. 1200-r.p.m. motor. The wheel and other driving shafts are mounted in either ball or roller bearings. The length of the machine over all is 11½ ft. and the width, 4 ft.

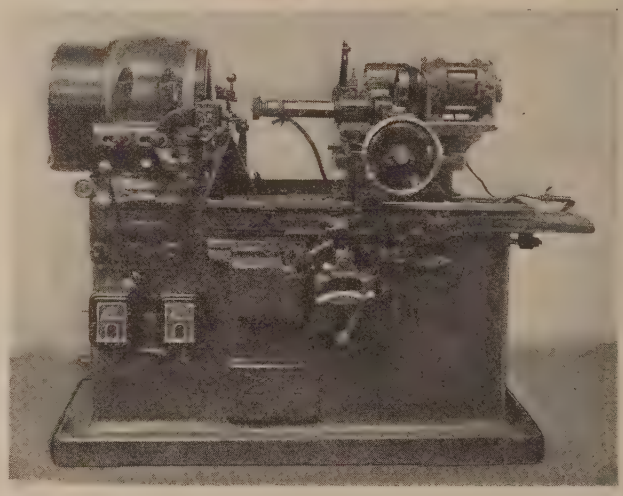


Special Grinder for Airplane Cylinders

GRINDING the bore of the single cylinders used on airplanes and motor-cycles will be among the operating exhibits of the Heald Machine Co., Worcester.

The hole is ground square with the flange and concentric with the skirt of the cylinder on a machine made up of the company's style 72-A internal grinder base, standard hydraulic table drive unit, table dogs and cross-slide, and a special workhead. The cross-slide is elevated 6 in. to give proper height, and has a dovetail way that provides unusually wide bearing surface for a special heavy-duty sleeve-type wheelhead. The workhead carries a spindle mounted on two precision ball bearings, and is driven either by a double-end motor or by belt from a pulley on the rear shaft. The machine is furnished plain or equipped for semi or full-automatic operation.





A major feature is the holding of the cylinder within the workhead, an arrangement that permits use of a short base machine and eliminates the overhang that would be present if the work were chucked in a fixture extending from the spindle nose. Before the cylinder is put into the workhead an adapter ring is bolted to its flange and a bracket with a stud is fastened to its rear. The cylinder with adapter ring is then loaded into the workhead from the left-hand end, and is centralized by five locating pins and guided into position by suitable guide bars. Next, the adapter ring is clamped against five positive stops, hook bolts that are operated from the front of the workhead being used for this purpose. A strap with self-alining end-support is then slipped over the stud on the bracket at the rear and clamped to the workhead spindle; this serves as a support and steadyrest against pressure of the wheel but does not affect the alinement or location. The operator prepares one cylinder while the other is being ground.

Automatic Milling Machine with Hydraulic Feed

AN automatic hydraulic-feed bed-type milling machine designated as the No. 36 Mil-O-Matic will be introduced by the Oesterlein Machine Co., Cincinnati.

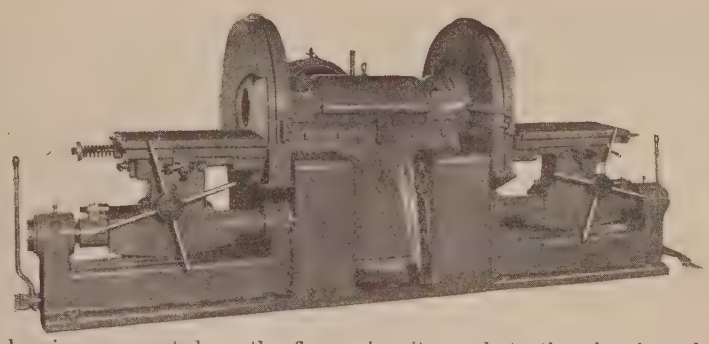
The machine may be equipped with either a plain reciprocating table having a working surface of 21 x 48 in. and 36 in. feed, or with an automatic indexing table of 14 x 24 in. working surface mounted on a slide having 24-in. feed. As an indexing machine the table makes a half turn at the end of its return stroke and advances again to the cut. Single-spindle, duplex, vertical and multiple-spindle types of the machine will be built. Several bed and table lengths will be available and special heads may be applied. Some of the features of the machine and its operation are outlined below; a more complete description, with illustrations, will be included in a later issue.

The spindle head carries its own motor; starting, stopping and reversing mechanism and control lever; pick-off gears; and all adjustable controls. Being self-contained, the head can be mounted at any angle to suit requirements. Spindle head gears are of alloy steel, heat treated, are multiple splined and inclosed in grease-tight cases. Anti-friction bearings are used throughout the drive, including the spindle which runs on two 12½ in. and two 5½-in. Timken roller bearings. The starting lever has forward, reverse and neutral positions. In and out adjustment of 8 in. is provided for the spindle, and vertical adjustment of 14 in. for the spindle head.

The direct-motor-driven Oilgear hydraulic unit that actuates the table feed is mounted in the column base. The column and outboard bearing support are interlocked by a heavy tie piece, but where the work is light or on duplex machines the outboard support and tie piece may be omitted and a "vee flat" overarm mounted on the spindle head.

Operation of the machine is automatic after the work has been clamped in the fixture and the quick-advance lever thrown. From quick advance the table slows down to the predetermined feeding rate and at the end of the cut is returned to the starting point automatically at the rate of 180 in. per min. As the table nears the end of the return stroke, a Geneva mechanism unlocks the index table, returns the ratchet and withdraws the table locating plunger. At the extreme end of the return stroke, if set to repeat, the forward quick travel begins again and in the first 2½ in. of forward motion the table is indexed automatically by means of a ratchet. Spindle speeds range from 20 to 242 r.p.m. and feeds, 0 to 30 in. per min.

Semi-Automatic Grinder Handles Heavy Work



DESIGNED to handle large or heavy work at a rapid rate, the new No. 9 40-in. heavy-duty super disk grinder, made by the Gardner Machine Co., Beloit, Wis., and exhibited at the show, operates semi-automatically, eliminating most of the manual labor ordinarily performed by an operator. Its grinding members consist of two 40-in. steel wheels faced with heavy-type Gardner G. I. A. disks, each rigidly supported by a wheel flange 29 in. in diameter mounted on a large spindle measuring 5-7/8 in. in diameter at the bearings. The spindle is carried in Timken bearings and is driven by spiral bevel gears inclosed in a grease tight housing.

The two work tables are adjustably supported on a reinforced box section cast-iron shaft, 3½ in. in diameter at its ends, with outboard bearing housings supported on the floor for their full length. Oscillation of the tables is regulated by hand and foot levers and the work is fed into the cutting member by spring tension. On many jobs one operator can serve both ends of the machine, loading one table while the other is presenting its work to the abrasive wheel. In such cases, production is materially increased, because both the machine and the operator are constantly at work. The machine weighs approximately 16,000 lb. Either belt or direct-connected 25 to 40-hp. motor drive arrangement can be furnished.

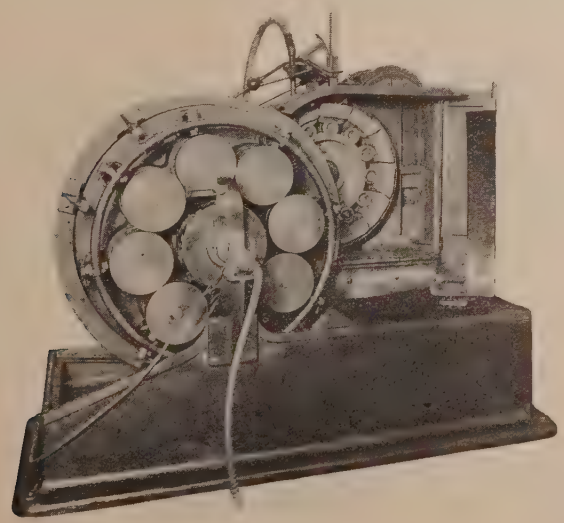
Continuous Grinding Machine

BOTH a continuous grinding machine and a surface grinder having a universal head will be exhibited by the Diamond Machine Co., Providence, R. I. The continuous machine was designed for the use of plants having to finish large quantities of pieces of one kind.

Mounted in place of the reciprocating table, of the standard machines, the continuous machine has a large circular fixture (work-head), which revolves across the abrasive wheel. Each chuck mounted on this revolving fixture is rotated by its individual motor. While the work-head is thus revolving across the abrasive wheel some of the chucks are exposed, so that finished work may be removed and rough pieces may be placed in the chuck. Turning of the work-head may be constant or intermittent as required. In either case, the motors rotating individual chucks are started and stopped automatically as the work-head revolves. To care for wear in the abrasive wheel, this is fed forward slightly from time to time.

The photograph illustrates a machine designed for grinding clutch disks. It is intended to finish three a minute and the limiting factor is the speed with which the operator can load and remove the work. The work-head revolves continuously and has eight stations. The machine was equipped with automatic air-operated chucks, but can be had with magnetic chucks when desired.

In another case, with a heavier machine and much larger pieces to be finished, the grinding time averaged about 11 min. to each casting. As there was thus ample time for unloading and re-loading, only two chucks were fitted, being standard, four-jaw, hand-operated units.



Improved Motor-Operated Oscillating Grinder

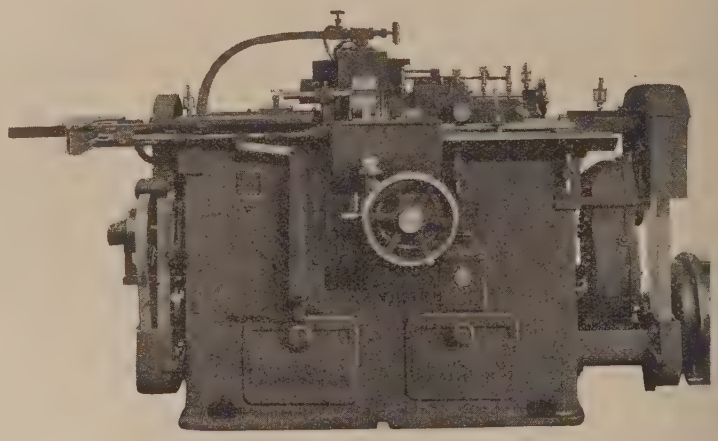
NEW features incorporated by the Van Norman Machine Tool Co., Springfield, Mass., in its new No. 25 type oscillating grinder, to be exhibited at the Cleveland Show, are said to virtually double the production obtained from the older type machines made by the company.

Two motors are employed, one driving the wheel-head and the other the work-head and oscillating mechanism. Full control of the oscillation and rotation of the work head is maintained by means of a lever shift, making it possible for the operator to start the operating part of the machine with only one motion. Ball bearings to the number of 32 are used in the construction of the grinder, bronze bearings for high-speed shafts having been eliminated. Both the work-head and wheel-head have four bearings each.

Improved Automatic Cylindrical Grinder

PRECISION grinders with improved features will be exhibited by the Arter Grinding Machine Co., Worcester, Mass. The No. 132 automatic cylindrical grinder, illustrated, will be in operation on the valve-stem guides, the outside diameter of which must be ground closely concentric with the bore.

The machine grinds by the straight-in feed method and has low angle centers, which enter rather deeply into the bore of the piece, thus providing arbor-like control. Except for loading the work-drum, all operations are automatic. Grinding is done with the full width of the wheel, which is slightly oscillated. Shoulders may be ground, using a special air-operated attachment which provides longitudinal feed of the wheel spindle.



Improvements include longer wheel-slide ways, increased diameter of the hand-wheel through which compensation is made for wheel wear, with means of making adjustments to 0.0001. Texrope type belts are now used to drive the wheel spindle, and the spindle bearing construction has been changed so that adjustments may be more readily made and properly maintained.

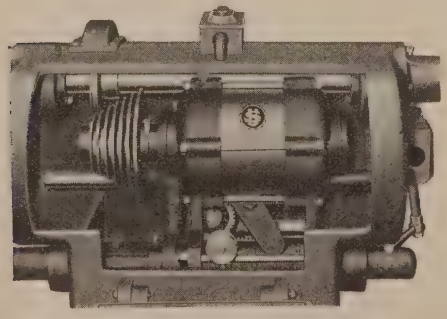
An improved rotary surface grinder, also to be shown, will have a new magnetic chuck with a separable top plate which may be replaced when worn. The working surface of the chuck is broken up into polar faces so that small washers, as well as large rings and disks are held equally well. The diameter of the chuck has been increased to 14½ in. Only one coil is used to energize the chuck. A brake mounted on the chuck-spindle is operated by the same lever as the clutch. The main shaft, its loose pulley and the main spindle idler run on ball bearings.

Buffer and Polisher with Four Wheel Speeds

FOUR different wheel speeds, ranging from 2000 to 3000 r.p.m., are obtainable on the new buffer and polisher designated as the Multi-Speed, that will be operated by the United States Electrical Tool Co., Cincinnati.

Speed changes are obtained through a Gibbs V-disk transmission of graphitized Micarta. A cone, or series of different size disks, is attached to the motor shaft as shown, the motor, in turn, being mounted on a rocker arm that permits it and its driving cone, to be swung forward and to be moved parallel with the wheel spindle. The Micarta disks drive a sationary metal V-disk or sheave on the wheel spindle; for speed changing they are brought into driving contact with the spindle sheave simply by releasing the motor and cone by means of a foot pedal and moving the cone to the proper position by means of the lever at the front of the machine. Speed changes may be made only when the motor and spindle is not in motion.

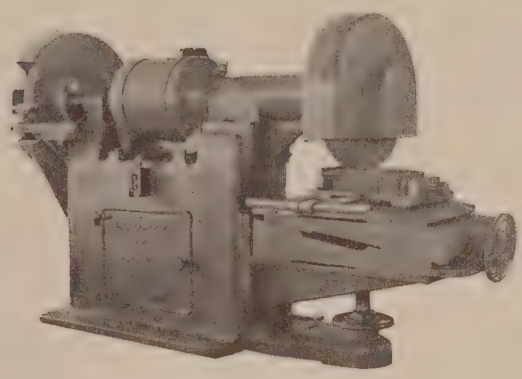
The chrome-manganese steel wheel spindle is mounted in four heavy-duty ball bearings which are inclosed in labyrinth seals in dust-tight grease compartments. The motor operates at 3600 r.p.m. and is controlled by push button, overload protection and no-voltage release being provided. The machine is built in four sizes, equipped with 1, 2, 3 and 5-hp. motors respectively.



Machine Grinds Radius on Journal Wedges

FOR grinding the radius on both new and worn journal wedges the Hill-Curtis Co., Kalamazoo, Mich., will exhibit an F-B journal wedge reclaiming machine operated by a 5-hp. motor. The tool consists of a profile block and machined surface to the machine surface of which is fitted a chuck that holds all standard A. I. A. wedges. This chuck, with journal wedge locked arm, projects toward the front of the machine and is guided under the wheel by means of a feather key which fits in guiding slots planed in the top of the profile block. After one section of the wedge radius is ground, the chuck is moved over on the profile block until the feather key in the chuck slides in the next slot. This operation is repeated until as much of the surface of the wedge as necessary is ground to reclaim the proper radius.

The amount to be ground from the wedge is controlled by the hand wheel at the extreme right of the machine which operates the screw that moves the adjusting block between the profile block and the base of the machine on an inclined way, thereby raising and lowering the wedge in relation to the grinding wheel. The wedge reclaiming end of the machine can be raised and lowered to compensate the wear by means of a vertical screw and hand wheel. The straight-faced wheel on the left-hand end of the reclaimer can be used for general purpose grinding. The right-hand side grinding wheel for grinding journal wedges is concave, but the left-hand wheel, 3 x 18 ft., is straight-faced for tool and production grinding.

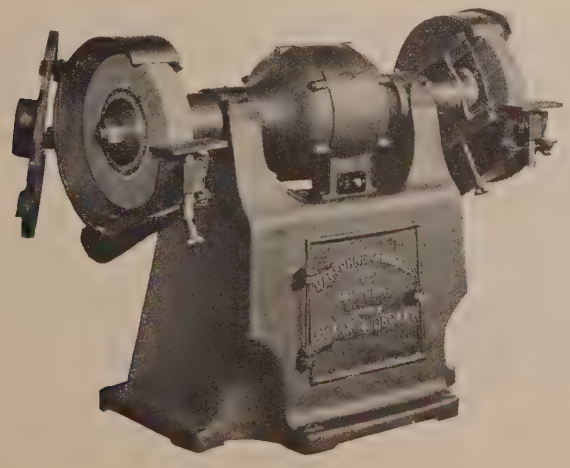


Floor Stand Grinder Operates at 9400 Ft. per Min.

THE new high-speed floor stand grinder illustrated, developed primarily for economical rough grinding of aluminum, brass and bronze castings, will be displayed by the Marschke Mfg. Co., Grinder and Buffer Division of the Black & Decker Mfg. Co., Towson, Md.

Grinding wheels are 20-in. in diameter, have a 10-in. center hole and operate at a surface speed of 9400 ft. per min. The drive is by a 5 or a 7½-hp. inclosed a. c. or d. c. motor. The spindle is carried on ball bearings located on each side of the motor and also at the extreme ends of the spindle, and labyrinth seals protect each bearing from abrasive dust and leakage of grease.

Features of the base include its weight, 1700 lb. for the 5-hp. 20-in. machine, rounded out corners to provide more ready access to the wheels; and a deep flare to provide maximum stability. The rugged and symmetrical design, together with the method of spindle mounting, is emphasized as eliminating vibration and increasing wheel life. Wheel guards are electric steel castings and have hinged inclosing covers. The work rests, mounted on the wheel guards, are adjustable by means of hand screws and lock to compensate for wheel wear. The guards have a sliding adjustment at an angle which assures that the front top of the wheel guard maintains the same distance from the work-rest, thus providing automatic spark protection. The guards being universal, the openings can be brought to any position and locked by means of a lever.



Browne & Sharpe Milling Machines

IN addition to its latest No. 30 and No. 32 plain grinders, the Brown & Sharpe Mfg. Co., Providence, will have in operation the new No. 2A universal, the No. 2 vertical and the No. 4B plain milling machines of its "standard" line, which has been described at length in recent issues of THE IRON AGE.

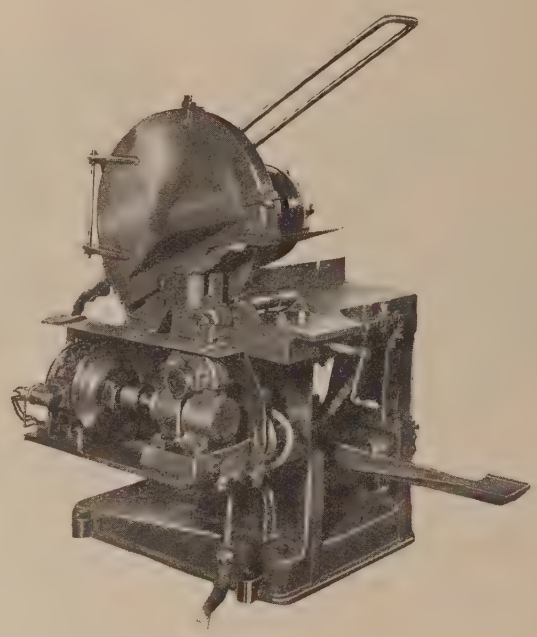
The No. 00G high-speed automatic screw machine equipped with automatic rod magazine will be a feature of the company's screw machine exhibit. A comprehensive line of small tools will be on display.

Friction Saw Attachment Eliminates Burr

A NEW rotating attachment that eliminates the burr in cutting round tubing, pipe and bar stock will be shown by Joseph T. Ryerson & Son, Chicago, in connection with its No. 0 friction saw which was designed for high production in cutting the smaller sizes of materials.

The rotating attachment increases the capacity and reduces the load on the motor. It consists of a special work-table on which supporting rollers are mounted, for holding the stock in position while being cut. One set of rollers is driven through a speed-reduction unit and gearing from a small motor. A second set is mounted on an adjustable bracket, which may be moved in or out to accommodate the stock.

By means of an air cylinder arrangement a third roller is brought down on top of the stock, holding it firmly in position while it is being rotated. This attachment provides rotation at constant peripheral velocity for any size of round stock. It eliminates necessity for chucking and for change-speed gears. The machine may easily be adjusted for cutting structural shapes by dropping off the drive rollers and replacing the adjustable bracket with a work-table plate. The drive is by 10-hp. 3600-r.p.m. motor. A 24½-in. saw blade is employed.

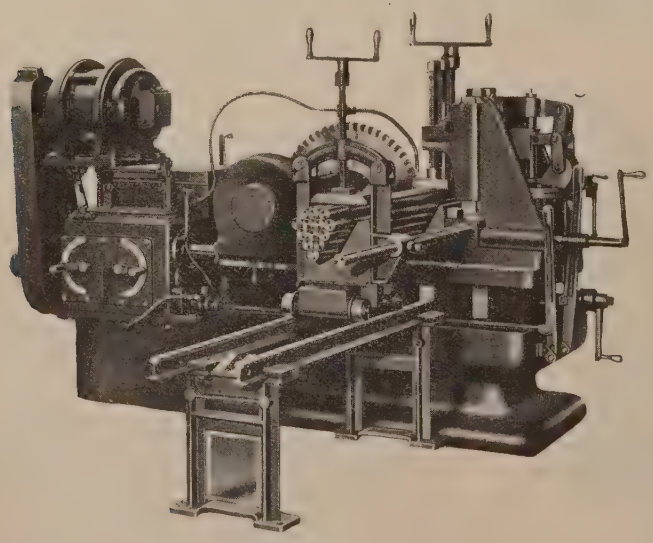


Other new equipment, to be illustrated in a later issue, includes a flue cutting and polishing machine and a flue roller.

Sawing Machines for Steel and Non-Ferrous Metals

MULTIPLE cutting of round steel bars will be demonstrated by the Cochrane-Bly Co., Rochester, N. Y., on its new No. 55 motor-driven metal sawing machine equipped with single compound toggle air clamp and multiple cutting fixtures.

The machine features roller-bearing driveshafts and hardened nickel steel driving gears that run in oil. Cutting speeds of 42, 60, 75 and 90 ft. per min., and 16 geared feeds ranging from ½ to 10 in. per min., are obtainable. The feed has a safety clutch to guard against breakage due to jamming of the carriage or other parts. A 7½ hp., 1200-r.p.m. motor is employed. With 24-in. saw blade the machine will cut 7½-in. round and 6½-in. square bars; the capacity of 60-deg. fixtures for multiple cutting ranges from 76 ½-in. bars to 4 3-in. bars. The machine weighs 4500 lb. net.



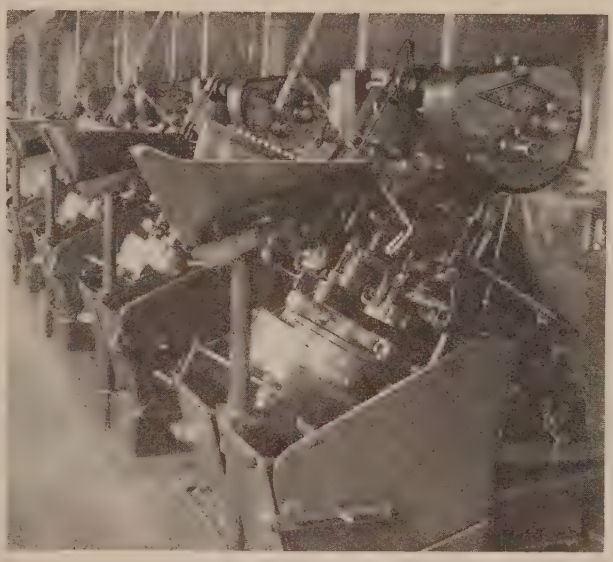
A 10-in. metal sawing machine, designated as the No. 66, with Oilgear hydraulic feed, duplex compound toggle air clamp and flood lubrication of blade will also be in operation, as well as a No. 21 automatic saw for cutting non-ferrous metals. The latter is equipped with multi-speed motor drive to the spindle, individual motor drive to the gear box and an automatic bar feed device. The latter is separately driven, and will feed 4 in. with the machine operating at 50 strokes per min.

Improved Automatic Forming and Threading Machine

AN escapement attachment for use in connection with long hexagon and square-head bolts, and bolts and screws having off-shaped heads, such as rim, plow and step bolts has been designed by the Landis Machine Co., Waynesboro, Pa., for its automatic forming and threading machine.

This attachment, built into the magazine, releases one bolt at a time at the end of the magazine, thereby relieving the bolt to be transferred to the chuck turret of the weight of the bolts in the magazine and preventing interference of bolt heads. It covers the entire range of machines from 5/16 to 3/4 in. in diameter and 1 to 6 in. in length.

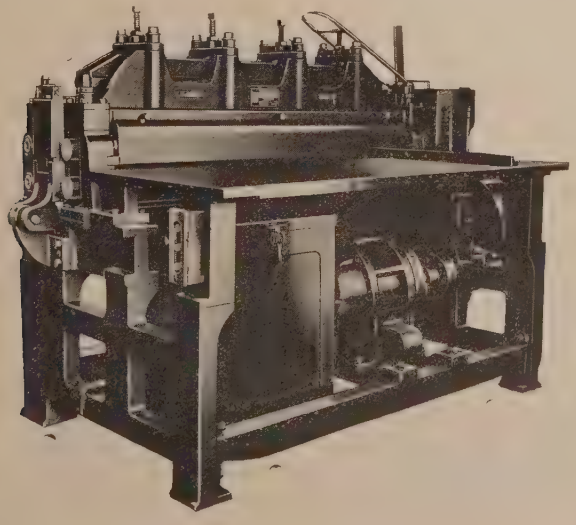
The machine to be exhibited will also be equipped with a new conveyor to deliver the bolts to the handling boxes. The conveyor is perforated and has an oscillating motion to move the bolts slowly towards the handling boxes, allowing most of the coolant to drain off of the bolts. The coolant is collected in the trough under the conveyor and returns to the sump in the bed. Small chips are also separated from the bolts, the chips dropping through the perforations in the conveyor as the bolts move along. The conveyor can be arranged to deliver the bolts either at the front or rear of the machine.



Improved Rotary Gang Slitting Machines

IMPROVED Putnam "type K" slitting machines, the heaviest type of the three types manufactured, will be exhibited by Manning, Maxwell & Moore, Inc., New York. An important feature is the method of mounting the cutter shafts and cutters to eliminate bending strains, and thus assure accurate cutting of the sheets into strips.

The cutter frame is interposed between two sets of feed rolls and carries two cutter shafts. It is arranged to swing out from between the rolls, thus providing accessibility for setting up and adjusting the cutters. The solid cutter frames, which are standard, are designed to use chair type cutters fitted into chair shaped bearings that are clamped rigidly to the cutter frame. The cutter frame, in turn, is fitted to the bed and clamped in position from above by means of a "strong back" between the uprights of the main frame. The chair type cutter bearings are bronze bushed and are fitted with flush type grease cups for pressure gun lubrication. This type of cutter must be ground on the side because the center distance between the cutter shafts in the solid type frame is fixed.



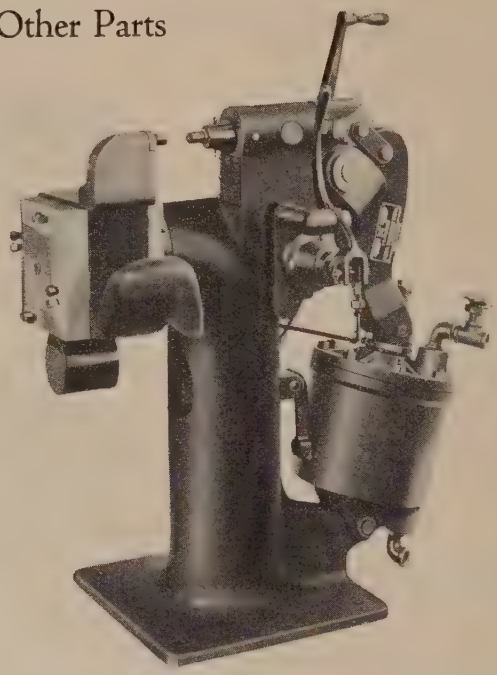
Adjustable cutter frames with block type cutters can be furnished special for cuts that are narrower than the minimum width with chair type cutters. The top cutter shaft is adjustable in a vertical plane, parallel with the lower cutter shaft, which permits grinding the block cutters on the periphery and to the exact width of cut required.

Intake and discharge rolls have adjustments by which they may be set apart slightly less than the thickness of the stock to be cut. A tension mechanism is provided to permit passing of stock that is thicker than the space between the feed rolls. The discharge rolls are hardened and ground to resist cutting of the rolls by the edges of the cut strips. Both sets of rolls are positively driven by gears.

Cold Rivets Chassis Frames and Other Parts

COLD riveting of automobile chassis frames and sub-assemblies will be demonstrated by the Hanna Engineering Works, Chicago, on a group of its "Rapid" type riveters which are built in a range of types and sizes and in capacities from 6 to 20 tons, for driving 3/16 to 3/8-in. rivets cold.

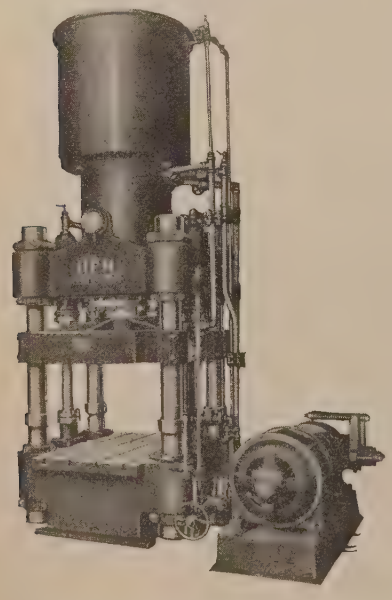
The machines will include the turret riveter illustrated. The rotating head mounts four horns or noses, any one of which, with its stationary die, may be indexed into alignment with the movable die on the plunger or ram. These noses enter the inside of the chassis frame, and because the clearance conditions at one rivet are frequently quite different from those at another rivet, the noses or horns are made in various shapes. From the standpoint of the variety of horn or nose clearance conditions met with, this machine combines in one unit four riveters of like reach, gap and tonnage. Production depends upon the number or frequency of indexes, but averages approximately 500 rivets an hour. A similar machine mounted on a swiveling base is also built.



A basic feature of these riveters is the simple lever and toggle mechanism which provides a long die stroke with wide range of uniform pressure, thus eliminating the necessity of screw adjustment of the die. The initial movement of the die is rapid, the speed gradually decreasing until the die enters the uniform pressure portion of the stroke. As the rivet head forms, the pressure increases to maximum, where it remains during several inches of piston travel. This dwell takes care of ordinary variations in rivet lengths and plate thicknesses.

Hydraulic Forming Press Completes 10 Cycles per Min.

RAPID operation, ease of control, variable working stroke and low power consumption are features of a new hydraulic forming press that will be shown by the Hydraulic Press Mfg. Co., Mt. Gilead, Ohio. The maximum pressure capacity of the machine, which is intended for forming and drawing in heavy gage metal, is 500 tons.



The machine is self-contained and is powered by an electric motor which drives a radial-type hydraulic pump. Operating pressure is adjustable over a wide range and the hydraulic control mechanisms may be set either for semi automatic or full automatic operation.

The semi-automatic cycle is started by tripping the starting lever or pedal, which causes the platen to travel rapidly downward. As the platen closes on the work it automatically slows down to full load rate, the pressure building up to a predetermined limit. The motion of the press is then reversed automatically and the platen returns at fast speed to an adjustable upper position, at which it stops. The full automatic cycle is the same except that operation is continuous until stopped by the operator. An operating speed of 10 cycles per min. on a 6-in. working stroke is readily maintained.

The machine is made in several standard sizes and pressure capacities, the operating speed of each of the different sizes being inversely proportional to the total pressure capacity.

Ball-Bearing Motor-Driven Trolley

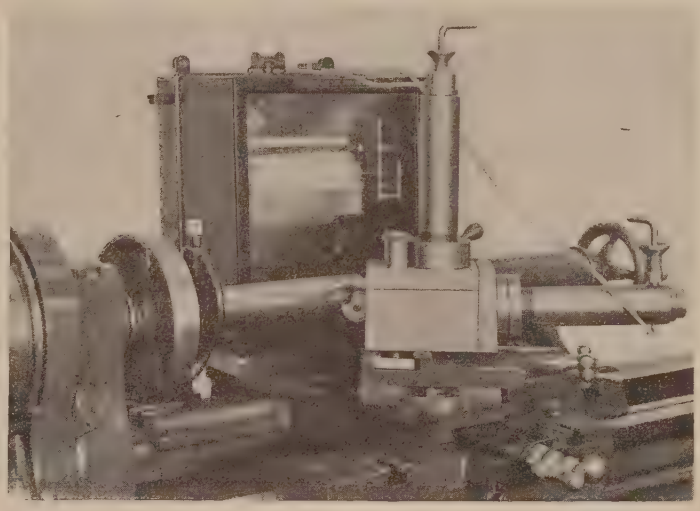
A NEW motor-driven trolley that operates at an average speed of 150 ft. a min. when loaded will be among the new equipment shown by the Yale & Towne Mfg. Co., Stamford, Conn. A ¾-hp. ball-bearing compound-wound direct current motor or a high torque, squirrel cage polyphase alternating current motor is used. The controller is of single-speed drum type, manually operated, but push-button contactor type can be furnished. Power is supplied either by a flexible cable for short runs or by overhead conductor wire and adjustable wheel type collectors.

Designed to provide the shortest headroom from the underside of the I-beam to the highest point of travel of the hoist hook, the trolley is adjustable on six sizes of I-beams from 8 to 18 in. Four roller bearing wheels provide smooth operation. Remote push-button control can be arranged. Heavy steel suspension plates provide for attaching hoist or chain block.

Determines Machinability of Metals and Efficiency of Tools

AN instrument known as the Machinabilimeter, uses for which include testing the machinability of metals, determining the best form of tool edge and cutting speeds and feeds, and the proper kind and amount of cutting compound for different materials and heat treatments, will be introduced by the Hall Planetary Co., Philadelphia.

The device, illustrated herewith, records the power consumed at the cutting edge of the tool; it is simple to operate and may be used in connections with lathes, planers, milling machines or grinders. Machinability tests are most readily made on a lathe, the piece to be tested being held between centers and the instrument mounted on the cross-slide. The cutter of the instrument is then brought in contact with the piece to be tested, and a cut of predetermined depth and feed taken. Thus the machinability of the metal is tested under actual working conditions, and the piece as a whole shown to be up to standard, or defective in that it contains hard and soft spots. Several short pieces of different material, or of the same material but different heat treatments, may be held on an arbor and tested.



Tools of button type with several cutting edges, these edges having different rake angles, etc., may be used to find the most economical form of tool edge for given conditions. Likewise, for a given tool and material the most economical feed and depth of cut can be determined; also whether a rough finished cutting edge or a polished edge is most suitable, and the effects of wear of tools on the economy of operation. The effect of different cutting oils and compounds on the cutting ability of tools may also be studied.

On a grinder, the device may be used to determine the pressure necessary to hold the grinding wheel against the work; on a milling machine, to determine the pressure required to drive the work into the cutter and vice versa.

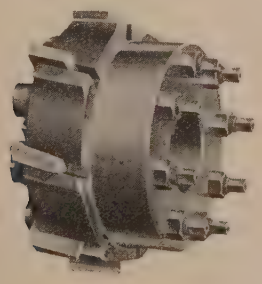
Boring Head Permitting Several Operations at One Set-Up

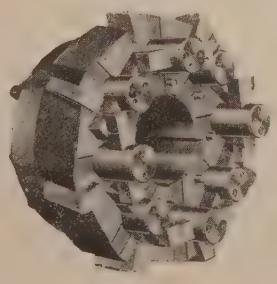
EXHIBITS by the Gairing Tool Co., Detroit, will include a boring head having tools that swing to and from the cutting position and may be very accurately set. The arrangement permits cutting large diameters, then reducing to smaller, passing through the job and again cutting the large diameters on the opposite end; it also permits finishing of various diameters on the return stroke. The tool is said to relieve the operator of responsibility for accuracy, because all blades are ground in position in one set-up, assuring concentricity of all cutting edges in relation to the axis of the boring head.

Inserting of reground and of new tools is simple. The blade is put in position, and calipers used to determine the dimension from the point of the blade to the opposite side of the boring bar; half the diameter of the bar is subtracted, the result being the radii on which the point of the tool will travel.

Swinging the tool to and from the working position is also simple. Set screws, shown in the front view illustration, hold each blade in position in its draw bar. The latter has a square end at the rear and a nut for drawing the blade snugly into the location slot at the front of the head. When this nut is loosened, a spring lifts the cutting tool free of the locating slot. The tool is then turned in or out of work position by means of a wrench applied to the square end of the draw bar.

Six sizes of this boring head are made. The head illustrated, equipped with inserted blades on its periphery, is designed for completing all boring operations on dual locomotive valve chambers in one set-up.





Electrically Power-Operated Lathe Chucks

INTERNAL and externally-operated chucks for both inside and outside work actuated by electric motor will be shown by the Union Mfg. Co., New Britain, Conn. Uniform pressure with minimum distortion of the work are advantages claimed, as well as rapid operation and minimum effort on the part of the operator. Power consumption is said to be small and use of the chuck frequently enables one operator to attend several machines.

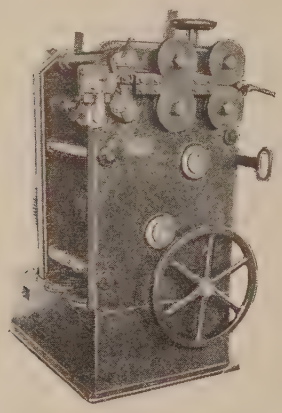
The externally-operated chuck is for both chucking and bar work, the internally-operated is for chucking work only and is provided with bushings for pilot bar. Pressure, ranging from 500 to 6000 lb., may be

varied to suit requirements. Control may be either by hand or foot. Push-button control is provided for the internal-jaw chuck, the external-jaw chuck being operated by a lever that opens and closes the jaws automatically. Solid and reversible top and special jaws can be furnished. The jaws are so made that when top jaws are removed bottom jaws are suitable for bar work.

Five sizes of the chuck, ranging from 10 to 22 in. are manufactured. All parts are of steel, working parts being of chrome-nickel steel and heat-treated.

Improved Spring Coiling Machine

THE spring coiling machine to be exhibited by Sleeper & Hartley, Inc., Worcester, Mass., while not entirely new, is of improved design.



The wire is gripped between feed rolls and is fed forward against the coiling tools, being rolled by deflection into the helical form.

A pre-determined length of wire is put into each spring. The cutting mechanism is automatic, each spring, as produced, being cut off at once. The machine will handle either round or square wire. Changes from one form of spring to another are made in from 10 sec. to 20 min., the time depending upon the complexity of the form. Springs may be wound either right or left hand, open or close coiled, of various diameters, coned with any degree of taper, with variable pitch, barrelled with any desired crowning, to almost any variable contour, tapered at one or both ends, and with one or more coils closed at one or both ends of the spring.

In operation the driving shaft pinion meshes into a crank gear, which drives an oscillating segment geared to a ratchet. The ratchet shaft drives the wire-feeding devices. Each stroke of the segment gear moving in one direction feeds a definite amount of wire. On the return stroke the feeding mechanism is stopped, giving the cutting mechanism time to cut off the spring just produced.

Eleven sizes of the machine, with capacities ranging from wire of 0.004 in. to ⅝ in. diameter, are built.

Small Electric Lift Truck for Congested Quarters

TO turn corners of 4-ft. aisles and to work in congested quarters, a light-duty small electric lift truck has been developed by the Elwell-Parker Electric Co., Cleveland. The machine is rated at 3000 lb. capacity; it handles skids now used with hand lift trucks.

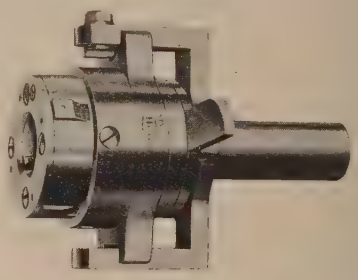
This truck is only 28½ in. wide and 83 in. long, and is low over the battery compartment, although the controls are retained at the usual height for the comfort of the operator. The lift platform is a single ⅜-in. plate bent and welded into a rigid, nosed skid support. It is nosed so that it may be eased under a loaded skid from an angle, such as a pick-up from the side of the aisle. The platform is backed at the rear with a heavy skid bumper angle surmounted by a ⅜-in. bumper plate with guide pin in ⅜-in. load dash extending the full width of the power end of the truck. The standard size of platform is 18 x 41 in. and 7 in. high, while the lift is 3½ in.

The ball-bearing, steerable trail wheels are fitted with 6½ x 4-in. rubber tires. Practically all steering connections are of the ball and socket type. The steering handle is on the operator's left and is of the vertical or pump-handle type, being pushed down to steer in the direction in which the operator leans when making a turn.

Travel controller is mounted on bent plate dash in front of operator and is actuated by a removable handle when the operator stands on the two pedals or on the divided platform. One pedal locks or unlocks this controller as the operator steps on or off, and the other pedal actuates the brake.

New 5/16 In. Die Head for Small Machines

FOR use on B & S No. 00 screw machines and other small automatics the Eastern Machine Screw Corporation, New Haven, Conn., will offer a new 5/16-in. die head, designated as the style D. This head has stronger and heavier chasers than the ¼-in. size, and is intended to enlarge the threading range of the small machines for which it is intended.



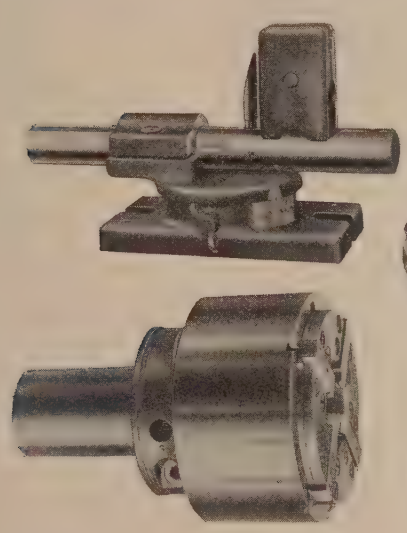
Among other styles of die heads, the new style EE sleeve-operated head for rotary spindles will be shown. Improvements in the H & G line include ground chaser cam holes in the body of the heads to provide maximum support for the chaser cams.

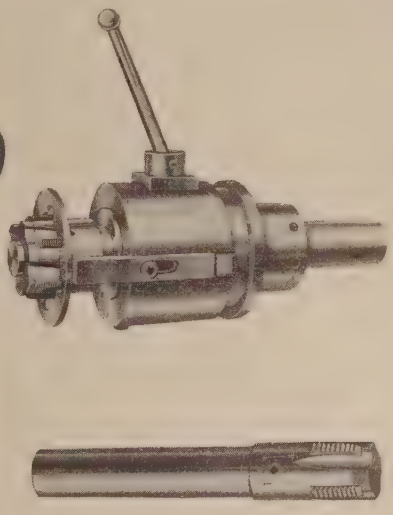
An improved chaser grinder with driving motor contained within the pedestal base, as shown in the illustration, will also be featured.

New Threading Tools

FOUR entirely new products will be exhibited by the Geometric Tool Co., New Haven, Conn. These include a class SJ solid adjustable tap, a class R receding chaser tap, a style KJ solid adjustable die-head and a universal chaser grinding fixture.

All working parts of the solid adjustable tap, even the size adjustment mechanism, are in the nose or front end. Thus, that portion of the tool carrying the chasers is the largest diameter of the tap, allowing it to cut threads to any required depth. This tap has simply a body, a plunger to hold the chasers in place, a couple of adjusting screws working on the plunger and a cap supporting the chasers.





The receding chaser tap was designed for taper threads of great depth and steep taper, cut in tough materials. All working parts are fully inclosed. The taper advances on the work as a jam cut tool. After the chasers have taken hold, an adjustable taper bar, working through a pawl on to the chaser plunger, causes the chasers to recede as they advance into the work. At a predetermined point the chasers collapse and the tool may be backed out.

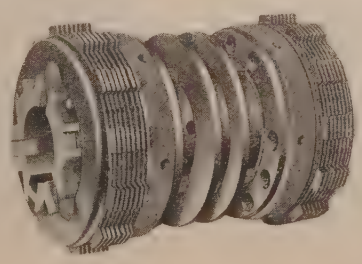
An important feature of the adjustable die-head is the accessibility of the size adjustment mechanism, permitting adjustment to be made without removing the tool from its holder. This mechanism is securely locked in place so that the die-head will not change its size, even when suddenly and repeatedly reversed at high speeds. Chasers may be quickly replaced by means of a thumb release on the back of the tool.

The universal grinding fixture can be used to grind chasers on both the cutting face and the chamfer. Milled chasers, tapped or hobbed die-head chasers and collapsing tap chasers may be re-ground with equal facility, though these chamfers are flat, concave or convex. The cutting faces of these different chasers may be given the required angle of hook or snub for the work to be done.

Multiple-Disk Clutches That Run in Oil

A MULTIPLE - DISK clutch designed to run in a spray or bath of oil will be introduced by the Twin-Disc Clutch Co., Racine, Wis. Designated as the type CC, it is made in a number of sizes from 3½ to 6 in. effective diameter of friction disks, in steps of ½ in., and also in 7, 8, 9, 10 and 12 in. effective disk diameter.

All parts of the smaller clutches, except the hard rolled phosphor bronze driving plates, are machined from the bars and steel frictional surfaces are hardened and ground. Centrifugal force operates to release the pressure levers, which are housed in the hub itself and are operated by sliding wedges that are also guided and housed in the hub. No cotters or similar devices are used in the assembly, and it is said to be impossible for any part of the clutch to become detached without deliberate disassembly. Compactness is a feature, and when installed there are no projecting parts. The method of adjustment employed in other clutches made by the company is retained in the larger sizes, and is applied in a modified form to the small models of the CC clutch. The construction lends itself to duplex operation.



⅞-In. Sensitive Drill Capable of High Speeds

RESERVE capacity to permit driving four ⅞-in., or equivalent, tungsten carbide, as well as the same number of high-speed steel tools, is claimed for a new four-spindle "Hi-Power" sensitive drilling machine to be exhibited by the Henry & Wright Mfg. Co., Hartford.

Although intended for production operations, the machine has long bearing surfaces dynamically-balanced rotating parts, and other features that adapt it for toolroom work. As exhibited, it will have three spindles driven by belt from a motor in the base and one spindle driven from a 1½-hp. motor on the rear of the column. Of three hand-feeding spindles, one will be equipped with ball-bearing back gear attachment; the fourth spindle will be furnished with a new full-automatic power feeding mechanism.

The base of the machine houses the motor, and contains the coolant reservoir. The spindle sleeve has an inserted nickel-steel rack mounted so that all load is transmitted directly to the sleeve instead of to dowels. The alloy steel spindle is ground to size and dynamically balanced. At its upper end it has six splines, which are said not only to provide sufficient surface to drive ⅞-in. drills under heaviest cuts, but also to give low unit bearing pressure on those driving surfaces so that the drill has the sensitiveness necessary for drilling very small holes.

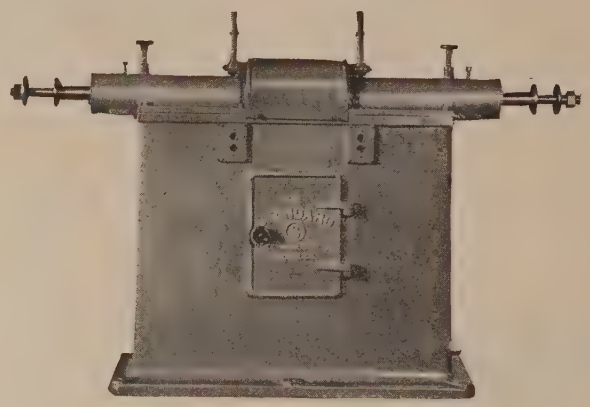
One large double row ball bearing is used at the lower end of the sleeve, and a single row ball bearing on the upper end. Lubrication of these bearings is by means of a wick in the cap on the upper end of the spindle sleeve. This cap holds sufficient lubricant for 10-hr. continuous operation, and the height of the oil is visible through a sight glass. It is stated that when the machine is in operation the upper ball bearing operates in a fog or mist; when it is stopped, most of the oil collects in a groove in a deflecting collar, but enough escapes to lubricate the lower bearing. When the machine is started, the oil in the deflector collar is thrown into the upper bearing, so that at no time is this bearing without proper lubrication.

Four spindle speeds, from 620 to 1000 r.p.m., are obtainable and four more, from 150 to 450 r.p.m., by means of the backgear attachment.

Two-Motor Buffing and Polishing Machine

TWO driving motors, one for each wheel, are used on the buffer and polisher illustrated, which will be shown by the Standard Electrical Tool Co., Cincinnati. Each motor is mounted on a hinged plate in the base of the machine, and each plate has an adjustable screw to take up belt slack. The Dayton cog belts used, run in V-grooved cast iron pulleys. Speeds ranging from 2000 to 3000 r.p.m. are obtainable by changing pulleys on the motor shaft. The machine is made in 3, 5 and 7½-hp. sizes.

Spindles are of nickel steel and are mounted in ball bearings which are inclosed in dust proof chambers and run in oil. Each spindle is fitted with a hand brake for quick stopping and also a shaft lock for use when changing wheels. Spindles of various lengths can be furnished. The motors are ball-bearing equipped and have independent push button control. The back of the machine is of sheet metal and is hinged so it may be raised, permitting full access to all parts.

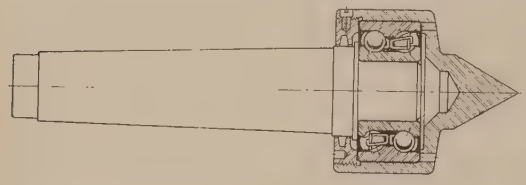


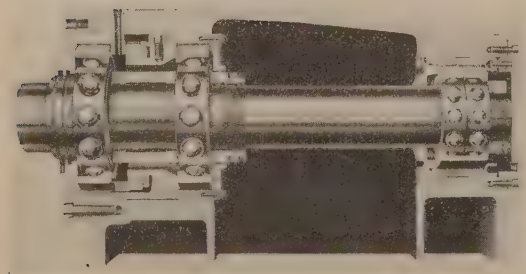
Ball Bearing Spindles and Live Centers

EXHIBITS by the New Departure Mfg. Co., Bristol, Conn., will include a heavy-duty spindle mounted on four ball bearings and a live center having double-row angular contact ball bearings.

The spindles also have bearings of the angular contact type, capable of resisting in thrust twice their rated radial capacity. The pair at each end are set up opposed to each other, with the bearings pre-loaded so that all radial and end play is eliminated. This spindle is so designed that it may be assembled and the bearings pre-loaded before being placed in the machine frame. It is capable of operation at the highest machine speeds and, when properly installed, requires no adjustment and practically no lubrication attention. It is said that it virtually eliminates chatter, and prolongs the life of cutting tools.

The live centers are assembled also in a pre-loaded condition. This feature, being built in during manufacture, is a permanent characteristic and not subject to change in use. This center is said to reduce chatter and to permit working at the highest speeds of which the lathe and other tools are capable. The work is brought very close to the supporting bearing. The seal is on the side opposite the work, thus reducing probability of cutting compound or chips getting into the bearing. The center is non-adjustable.

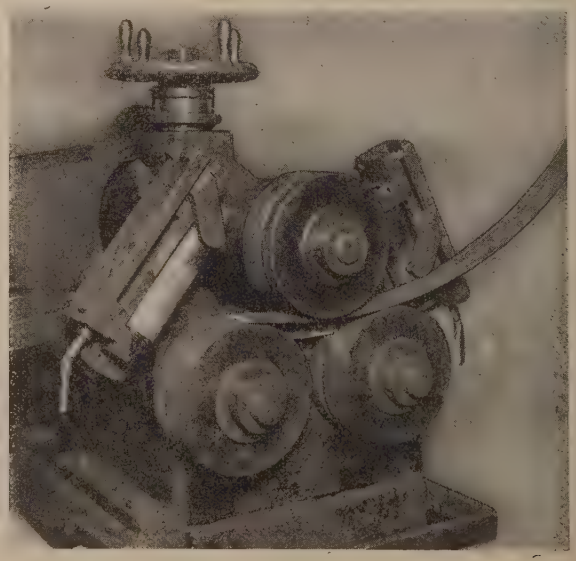




Bends Angle Iron Rings with the Leg In

BENDING rolls shown by the Buffalo Forge Co., Buffalo, will be equipped with a new device that permits bending angle iron rings with the leg in, in a single pass through the machine and without the necessity of a preliminary bend.

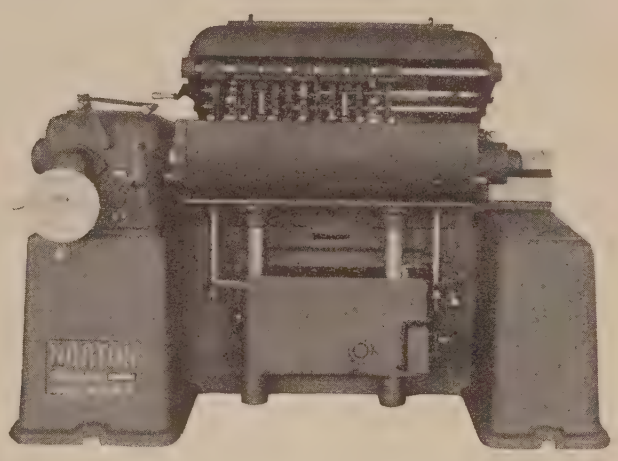
Heretofore in bending angle legs in, it has been necessary to stretch the outer leg by a preliminary bend, thus compensating for the material which is compressed when bending a ring with the leg in. The device also serves as a gage, and is useful for opening up rings bent to too small diameters. It can be applied to Buffalo benders now in use.

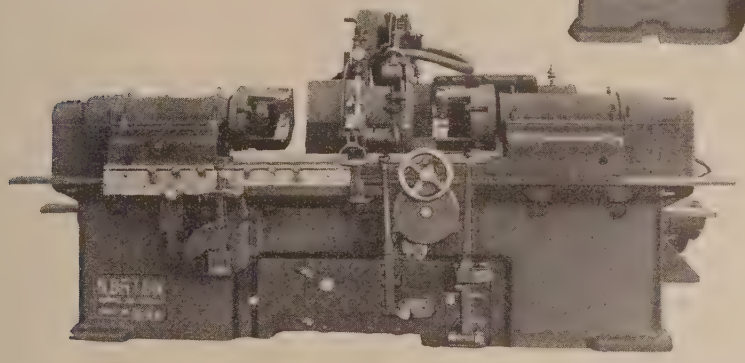


Crankpin Grinder with Features That Facilitate Operation

THE Norton Co., Worcester, Mass., will have in operation a new double-head crankpin grinder with features intended to minimize the operating hazard and the manual effort in its operation. Action of the work-holders, table and wheel-slide are hydraulically controlled and, by means of an interlocking device, these units are interdependent. One cannot be moved while either of the others is in operation.

Arrangement of the steadyrest, another feature, is such that when the rest is unclamped from the table it moves upward, affording easy access to the work. The upward movement





also stops the flow of lubricant, although this may be renewed if desired by manual control. Attached to the rest are splash guards and a Pratt gage, which also move with it in or out of the operating position. This mechanism facilitates operation and makes unnecessary the lifting of work over the steadyrest in loading or unloading the grinder.

The base of the machine has been designed so that work is supported much closer to the operator and somewhat lower than usual, permitting crankshafts to be handled without the assistance of an overhead hoist. Workholder spindles are synchronized and driven by two silent chains controlled by idler sprockets. The right-hand head is stationary, while the left has lateral adjustment to permit maintaining proper alinement of the crankshaft. The work is gripped in hydraulically-operated clamps and failure of the hydraulic mechanism does not release them. Locators on the workholders control the angular and endwise location of the pins in relation to a prescribed indexing position on the crankshaft.

The machine may be set for a crankshaft with four, six or eight crankpins, a spacing bar and dogs, with positioning slots, locating the lengthwise position of the work-table for grinding each pin. Slow movement of the table is provided for truing the grinding wheel. The wheel-slide has four adjustments: Fast motion to the shoulder of the pin; controllable feed down the shoulder to the body; fast return to the extreme rear position of the slide; and slow motion in both directions for truing the sides of the wheel. In this operation hand feed is employed.

One motor drives the machine. The swing is 17 in. and six sizes are built.

Improved Crankshaft Lapper Also to be Demonstrated

An improved crankshaft lapping machine with mechanical elevating table for raising and lowering the work will also be shown. The crankshaft is placed on supporting blocks on a table 28 in. from the floor and raised mechanically into alinement with the headstock and tailstock. It is instantly located with the driving-pin. No great amount of lifting is left for the operator. When the lapping operation is completed the shaft is mechanically lowered clear of the lapping arms for inspection.

Lapping time is also mechanically controlled, the mechanism being set to lap for a given time, at the expiration of which the work stops. By this method each shaft is lapped an exact predetermined time. Greater ease of operation and a greater degree of uniformity of finish is claimed.

Design of the lapping arms, which are now counterbalanced and suspended from a vertical position so that the weight of the mechanism has no influence on the lapping action, is another improved feature. The arms, with minor adjustments, may be adapted to any crankshaft.

This machine, intended for lapping all main bearings and crankpins at the same time, has a capacity for crankshafts up to 42 in. long. Abrasive paper, cast iron laps with loose abrasive or abrasive sticks, may be used.

Widia Tungsten-Carbide Tools Will Be Demonstrated

IN addition to tungsten-carbide lathe tools, Widia tools for boring and rock drilling operations, drills for hard and highly abrasive materials and reamers will be shown by Thomas Prosser & Son, New York. Wear resisting bushings and grinder centers will also be displayed.

High-speed cutting of chilled cast iron, manganese steel and other materials difficult to machine, as well as interrupted or jump cuts in a cast-iron slotted shaft having a Brinell hardness of over 200, will be featured. Cutting of the slotted shaft will be at a speed in excess of 650 ft. per min., a feed of 0.036 in. and depth of cut of $\frac{5}{8}$ in. The slots in the shaft cause about 400 blows per min. on the edge of the tool.

The present status of cemented tungsten-carbide tools and dies will be discussed by Dr. Zay Jeffries, consulting engineer, General Electric Co., at a meeting to be held by the machine-shop practice division of the American Society of Mechanical Engineers at the Hotel Cleveland, Cleveland, Oct. 1. This session is one of several arranged for the week of the National Machine Tool Exposition.

Steel Floor Plates Used for Diesel "Yarders"

A new use for non-skid floor plates has been found by the Central Iron & Steel Co., Harrisburg, Pa., which has supplied this product for the platforms of Diesel engines used in the lumbering district of the Pacific Northwest. These Diesel engines, called "yarders," are used in all kinds of weather, and as the operators on the platforms work 8 ft. above ground the danger of accident is present when there is snow, sleet or rain. The use of floor plates, it is stated, will remove this danger.

In producing floor plates for this purpose, the Central Iron & Steel Co. flanged them without distortion to an angle of 45 deg. while cold, said to be an unusual accomplishment with floor plates of this character.

Electric Furnace Used to Study the Stars

At the coming convention of the American Electrochemical Society to be held at the William Penn Hotel, Pittsburgh, Sept. 19 to 21, Dr. Arthur S. King of the Mount Wilson Observatory, Pasadena, Cal., will describe the results of his years of painstaking investigations on the spectra of the stars.

A special electric vacuum furnace was developed by Dr. King for this purpose, which rendered metallic vapors luminous. High temperatures alone appeared to be necessary to produce the large variety of spectroscopic phenomena observed. No definite type of chemical action has appeared to be necessary. Metallic vapors near the melting point produce a spectrum consisting of a few lines. At higher temperature stages, other groups of lines successively appear, till at the highest temperatures practically the whole spectrum of the neutral atom, and many of the more sensitive lines of the singly ionized atoms are in evidence. Dr. King's new method permits an extension of temperature classification far into the ultra violet.

Expects to Eliminate Hysteresis Losses

That electrical machinery to be built in years to come will be far more efficient than the best machines of the present day is the contention of Dr. T. D. Yensen, engineer in charge of the magnetic section, Westinghouse Electric & Mfg. Co., of East Pittsburgh, who will discuss the subject at the convention of the American Electrochemical Society, Hotel William Penn, Pittsburgh, Sept. 19 to 21. Starting out with iron electrolytically produced as a basis, Dr. Yensen further purifies this in an electric vacuum furnace and obtains a metal which analyzes almost 100 per cent pure iron. Dr. Yensen believes that hysteresis losses will eventually be entirely eliminated.

Standardization of Brass Pipe Nipples

Commercial standard C.S.10-29, of the United States Department of Commerce, deals with brass pipe nipples of three grades of brass, and covers both the iron pipe size and the extra strong size. Tables show standard weights and dimensions for the 17 sizes, from ⅛-in. iron pipe size to 10-in., which have been adopted as standard by the trade. Taper pipe thread dimensions are given and a list of stock sizes of standard weights, including both right-hand threads and left-hand threads.

This is part of the waste- elimination work which the Division of Simplified Practice has been carrying on.

Oxygen Regulator Has Double Diaphragm

Harris Calorific Co., Cleveland, has introduced an oxygen regulator which reduces the cylinder pressure to a pressure suitable for cutting and welding equipment in two stages. Two diaphragms are provided, each with its separate seat, properly proportioned of correct materials for the duty intended. It is claimed that this gives a much better control than a single-diaphragm regulator, where the one valve seat is depended upon for the dual purpose of holding the 2000-lb. cylinder pressure, and of regulating the flow to a torch needing anything from 1 lb. to 50 lb. pressure.

Conveyor Molding Unit Cuts Cost of Casting Babbitt Metal

ONE man can do in 19 min. what formerly took four men an hour in the casting of babbitt metal pigs in the plant of the Federal Mogul Corporation, Detroit, through the installation of the mold conveyor shown in the accompanying illustrations. The Federal Mogul Corporation, a large manufacturer of bearings, installed this equipment recently. Before the installation four molders were required; now one man does the same work in less than a third of the time.

The saving in wages amounts to $15 a day, and the mold conveying and casting unit takes half of the floor space that was used for the same work before the new installation was put in.

The equipment, which was provided by the Palmer-Bee Co., Detroit, consists of a reversible conveyor which carries the molds for the casting of the babbitt metal. A 2-hp. drive at 1200 r.p.m. operates the conveyor. The power unit includes Reeves variable speed transmission, which permits a travel of the conveyor belt ranging from 2 to 5 ft. a minute, as desired.

Placed alongside the melting furnaces, the molds on the conveyor belt can be filled by one operator, who pours from a dipper as shown in one of the illustrations. The pigs drop at either end of the conveyor into pits. With this equipment, 50,000 lb. of babbitt metal in 35-lb. pigs is cast in one day.

Not More Than a Minor Reaction Ahead

Business Not Yet Seriously Handicapped by Credit Stringency, But Possible Overreaching of Activity in Steel and Automobiles May Bring Recession

BY DR. CHARLES O. HARDY

THE record of the summer of 1929 will make cheerful reading for future students of the annals of American business. When the summer season opened, business and industry of almost every description were running at a high level; indeed to many a reaction seemed to be overdue. That the summer would bring at least the usual hot weather letdown seemed to be almost a certainty. Moreover, weather conditions turned out to be unusually trying.

Yet there has been little sign of the usual hot-weather recession, and the autumn opens with every indication of a continuance of such a high level of business activity as would have to be considered abnormal by the standards of a few years ago. Statistical barometers that reflect the condition of a wide variety of businesses, such as railroad car loadings, factory employment, payments through banks, consumption of electrical power and newspaper advertising, have all been running at high levels. Individual industries, notably iron and steel and automobile manufacture, have broken all records. Moreover, industries which have been backward during recent years, such as coal and certain textiles, have shown improvement.

Is such widespread activity in what is normally a dull season a favorable or unfavorable sign? Should we congratulate ourselves that the bugbear of summer inactivity has been vanquished, or should we apprehend that production is outrunning its market and setting the stage for the old spectacle of sudden business collapse, to be followed by a period of stagnation?

Production Matched by Consumption

In attempting to answer this question we may profitably consider several distinct sets of factors. First, what are the indications from the side of consumption and the state of inventories? On this side our data are very incomplete, but so far as they tell us anything they give no ground for alarm. Indexes of consumption indicate that in most lines the high level of productive activity is matched by a high level of consumer buying, and presumably of consumption. Department store sales are running at about the level of a year ago, while mail-order sales have increased by leaps and bounds. (The mail-order figures are, of course, swelled by the entry of prominent mail-order houses into the department store field, sales at their retail establishments being reported as mail-order and not as department store transactions.)

Stocks of goods on hand reported by department stores and also by wholesalers indicate that there has been no dangerous piling up of goods in the hands of middlemen, though there is some evidence of an unusual accumulation of stocks of raw materials in the hands of manufacturers. Moreover, retail collections have been running better than a year ago, so that the expansion of retail trade appears to be on a sound financial basis.

¶ Security market operations have not curtailed new financing, but have caused a shift from bonds to stocks.

¶ Industrial building, financed through the stock market, is active, contrasted with residential and public construction, which have been checked by the cost of long-time money.

¶ Interest cost of financing actual turnover of goods is of minor consequence, especially under hand-to-mouth buying.

¶ Inventories of middlemen not excessive, though there are indications of accumulated raw material stocks in hands of manufacturers.

¶ Transportation, productive capacity and labor supply show no symptoms of such strain as to portend business collapse.

Current Business Basis is Notably Favorable

A second line of inquiry as to the soundness of the current business program relates to the cost of doing business. Here also the indications, on the whole, are very favorable. In spite of the large volume of business there have not yet appeared the familiar symptoms of strain on the productive apparatus of society which have so often indicated the approach of business collapse. The most conspicuous illustration of the favorable situation in which business finds itself is afforded by transportation. In spite of a record-breaking volume of business, the railroads are maintaining the high record of efficiency and satisfactory service that has been characteristic of the past five or six years. Without marked expansion of the amount of rolling stock, the unprecedented volume of business is handled without complaints of car shortage or terminal congestion.

Likewise the labor situation gives, so far, no evidence that the pace of production is too rapid to be maintained. Until we begin to hear numerous reports of excessive overtime, strikes, rapid wage increases and complaints of diminished efficiency and a high rate of turnover, the labor situation must be adjudged favorable to continued prosperity.

High Money Not Hampering Turnover of Goods

A third point at which the stress and strain of excessive business activity has typically shown itself in the past is in the money market. Just as a boom which over-taxes the transportation facilities and the labor resources of the community inevitably undermines itself through pyramiding costs, so an attempt to expand business beyond the financial resources of the community may involve such pressure on the money market as to make its own continuance impossible. Here the case is now less favorable. Money rates by the standard of recent years are high, and show no signs of falling. Under the leadership of the New York call loan market, commercial paper rates, bond yields and acceptance rates have been advancing for nearly two years and now stand at the highest level since the crisis months of 1920-1921.

It does not appear, however, that business as yet has been seriously handicapped by a shortage of money. The experience of 1928 has gone far

to convince the thinking public that the influence of money rates on stock markets has, as a rule, in the past been greatly exaggerated by market analysts. The experience of 1929 is teaching the same lesson with regard to the influence of money rates on general business activity. What cramps business is not so much a difference of 1 per cent or 2 per cent in the price paid for short-time money as actual inability to get funds, and so far there has been little complaint that legitimate business has been handicapped by an actual shortage of credit.

With orders on the books, or with a firm market for products at profitable prices, the interest cost of financing the actual turnover of goods in manufacture or in wholesale trade has always been of minor consequence, and with the spread of hand-to-mouth buying it has become a less important element than ever before. It is in the speculative carrying of inventories beyond the normal needs of business that the price of money becomes a major factor, and all the available evidence indicates that the present business boom has been marked by a minimum of such speculative accumulation.

Credit Situation No Bar to Industrial Construction

The cost of long-time money is a more serious element in the business situation. The interest cost of the construction of a building, to be paid over a long term of years, cannot be ignored as readily as can the interest cost on a turnover of merchandise. Continued high rates for long-time capital can hardly fail to have a repressive influence on construction activities and a serious check to construction carries with it the threat of a genuine curtailment of business activity all along the line.

Building construction and permits (in spite of a bulge in July) have, for some months, been showing a downward trend, and this may well be a result of the relatively high cost of money. Two facts must be noted, however. First, rates have been high only for capital secured through bond issues; for firms that can secure their funds through stock issues the market has been and continues extremely favorable. The result of the extraordinary security market operations of the last year has been not a curtailment of new financing but a shift from bonds to stocks. This has handicapped those types of construction activity which cannot readily be financed through the stock market—such as residential building and public construction—but it has greatly stimulated industrial building activity. In the second place it must be noted that, while bond yields are high in comparison with stock yields and in comparison with the level of the past three years, they are no higher than they were in 1923 and 1924, when the post-depression building boom was in full swing.

No Business Depression in Prospect

Our conclusion is that in most lines of business the rapid tempo of the last six months has not produced such pressure on either the transportation equipment, the labor resources or the money markets of the country as to undermine seriously the capacity of well-managed industries to make satisfactory profits. This conclusion is confirmed both by the statistics of the failures and by the extremely favorable reports of corporation profits.

In summary, there seem to be no grounds for predicting the appearance of a major business reaction within the visible future. This is not to say, of course, that there are no lines of business in which production has run to excess and must be compensated for by a period of slackness. As Dr. Haney has pointed out in these columns in several recent articles, the indications are that steel production in the last few months has been much greater than seems to be required by the activity and prospects of the principal steel consuming industries. Likewise, there seems to be little prospect that the automobile industry can for an indefinite period find buyers for as many cars as it has been turning out in recent months. But such readjustments, at the worst, threaten a minor recession like that of 1927. They do not indicate the approach of a business depression.

Car Needs Expected to Gain in Last Quarter

An increase of 6.3 per cent in the number of freight cars required for the movement of iron and steel products in Pittsburgh and tributary districts in the fourth quarter of this year, as compared to the corresponding period of 1928, is predicted in the quarterly report of the Allegheny Regional Advisory Board. This figure is based upon replies to a questionnaire submitted by the board to shippers in western Pennsylvania, eastern Ohio, northern West Virginia and western Maryland and was formally announced at a meeting of the board in Canton, Ohio, on Sept. 12.

The estimate is particularly significant in view of the fact that the fourth quarter of last year was the best of the year in steel production. The figure does not include tin plate, on which a 0.4 per cent increase in car requirements is expected, or iron and steel scrap, on which a decrease of 1 per cent is looked for.

The large expected increase in steel shipments is partially explained by even heavier expansion in the car needs for commodities into the manufacture of which iron and steel enter in a large way. On agricultural implements and vehicles, the prospective increase in the last quarter over the corresponding 1928 period is 17.6 per cent; on castings, 26.4 per cent; on machinery, 11.5 per cent, and on electrical goods, 1.2 per cent. Decreases of 4.2 per cent on boilers and 5.1 per cent on sanitary ware are expected. Heavy increase in coal shipments is expected, the eastern Ohio region predicting a 51.4 per cent upturn in car requirements. An increase of 6.1 per cent in coke car requirements is also predicted.

DR. CHARLES O. HARDY of the Brookings Institution, Washington, will be a regular contributor to THE IRON AGE on the business situation. Born in Missouri in 1884 and educated in the public schools of Kansas and at Ottawa University, Ottawa, Kan., he took graduate work in history and economics, chiefly at the University of Chicago, where in 1916 he obtained the degree of Doctor of Philosophy. He was assistant professor of finance at that college from 1918 to 1922 and was professor of economics at the University of Iowa from 1922 to 1924. Dr. Hardy then joined the research staff of the Institute of Economics, now a subsidiary of the Brookings Institution. In 1927 he was joint author with G. U. Cox of "Forecasting Business Conditions." In 1925, in collaboration with R. N. Owens, he published "Interest Rates and Stock Speculation." He has contributed articles to *Annalist, New Republic, American Economic Review, Journal of Political Economy, Bulletin* of National Tax Association and *Proceedings* of American Statistical Association.

How Scrap Is Handled in Germany

Cooperative Methods in Vogue in That Country for 25 Years Said to Have Solved Many Problems

WITH uniform specifications for scrap iron and steel, with neutral inspection service on rejected cars, and with standard contracts, the steel mills and scrap iron dealers of Germany protect each other against the losses and the risks of the business and have found that over a period of 25 years cooperation is the best solution of their mutual problems. This was revealed in a conference in New York between Benjamin Schwartz, director general of the Institute of Scrap Iron & Steel, Inc., and Dr. Max Gerber, secretary of the Scrap Iron Association of Germany.

Mr. Schwartz has issued the following statement regarding the scrap purchasing methods in vogue in Germany:

"Doctor Gerber was commissioned by his organization to visit the American institute, to study the scrap iron situation in this country and to prepare a report for European organizations. It is expected that an exchange of information and facilities will be worked out between the American institute and the German association.

"The situation in Germany presents a sharp contrast to conditions in America, where each mill has its own specifications for scrap, every consumer determining for itself what are good shipments against its specifications, and where the competition among both consumers and dealers for scrap is unchecked, and in many cases unprofitable. In Germany, the steel mills and the scrap iron dealers each have their own organizations. The mills have created a central purchasing bureau and the dealers sell their scrap through a separate selling agency. The mills and dealers recognize each other's organization.

"The German mill men meet monthly, discuss their requirements for the month, and a quota is assigned to each mill for that period. Similarly, the dealers, through their organization, are given a quota of scrap, which they contract to deliver. The purchasing bureau of the mills buys the scrap and distributes it wherever it is needed, in accordance with the quotas assigned.

"The Iron and Steel Institute of Germany, representing the mills, publishes figures of scrap consumption, scrap produced at mills, stock on hand and market requirements, and both parties enter into contracts with full knowledge of the facts.

"All relations between dealers and mills are governed by a contract which has been running for the last three years. The dealers in turn have contracts with their selling agency. The contracts provide that the price for heavy melting steel is the standard and all other scrap commodities are on a fixed differential below heavy melting steel, the price for scrap, although fixed for every dealer, fluctuates in accordance with supply and demand. The price to every dealer is f.o.b. Essen, in West Germany, minus the freight from Essen to the point of shipment.

"The contract further provides for an accounting to the mills and dealers once a month. The mills are charged the average price of scrap shipped from all sources, plus the average freight, plus a share of the expenses of the purchasing bureau. The dealers are paid three times a month, or within 30 days. This plan has been found satisfactory in solving the problems of the scrap iron industry in Germany, after 25 years of organization and experience.

"Except for the war period, when the Government had an official commission to regulate the price and distribution of scrap, the mills and the dealers have been cooperating during this period to assure their supply and to eliminate the losses and risks of the business. The scope of the business, under the uniform contract, can be seen from the fact that the selling agency for the scrap iron dealers employs approximately 200 persons, while the purchasing agency of the mills employs approximately 60. The total consumption of scrap by the German steel industry amounts to approximately 7,500,000 tons annually, of which 3,500,000 tons is purchased in the open market, the balance being 'home' scrap."

Gulf States Steel Co. to Roll Coninuous Sheets

Gulf States Steel Co. has been granted a license for the construction of a sheet mill using the American Rolling Mill Co. continuous process. Plans for new plant capacity at Alabama City, Ala., which call for four to six hot mills, are now being revised. Preliminary work on the building of blooming and plate mills has begun.

$35 a Share Offered For Donner Common Stock

The Marine Trust Co. of Buffalo, acting as agent for the purchase of shares of common stock of the Donner Steel Co., Buffalo, has announced that it is prepared to purchase at $35 a share all or any part of the outstanding shares of common stock which may be tendered at its trust department, 237 Main Street, Buffalo, on or before the close of business Sept. 27, 1929.

This offer is accompanied by the following statement under the signature of William H. Donner, president of the company:

"During the past summer negotiations were undertaken for the sale of a substantial block controlled by my interests of outstanding common stock of Donner Steel Co., Inc. These negotiations resulted in an agreement for the sale of the said stock at $35 a share. One of the conditions of the sale required the purchaser to offer to purchase the remaining outstanding shares of common stock of the company at the same price. The inclosed offer of the Marine Trust Co. of Buffalo, acting as agent on behalf of the purchaser, dated Sept. 13, 1929, is made in accordance with that agreement."

The foregoing is the only formal statement that has been made by the Donner interests so far in the development of negotiations by which controlling interest of this plant was transferred to Cyrus S. Eaton of Cleveland.

Starts Movement for Tax Reduction

A movement has been launched by the Illinois Manufacturers Association to obtain a reduction of the Federal corporation income tax from 12 to 10 per cent. A resolution urging such action has been adopted and copies will be sent to members of Congress. It declares that this action would stimulate industrial activity and furnish additional employment at a time when most needed and increase corporation earnings so that individual gains would be available for personal income taxes.

Allis-Chalmers Mfg. Co. May Buy Plow Works

Complete purchase of the La Crosse Plow Works, La Crosse, Wis., by the Allis-Chalmers Mfg. Co., Milwaukee, is expected to be completed at a reported cash price of approximately $1,000,000 before the end of September, according to recent announcements. The La Crosse plant, it is also announced, will be enlarged and production stepped up to an annual sales volume of about $1,000,000, as against the present total of about $600,000 annually.

Negotiations for the deal have been going on for the last four weeks. The Allis-Chalmers Mfg. Co. had determined that the acquisition of the La Crosse plant would fit in with its program of tractor development in which the United Tractor & Equipment Co. has served as a sales medium.

Officials of the Allis-Chalmers Co., while conceding the correctness of reports regarding the purchase of the La Crosse plant, refused to confirm or deny other reports that the plant of the Falk Co., Milwaukee, manufacturer of gears, speed reducers and Diesel engines, was to be absorbed.

The La Crosse concern makes plows, harrows, disks, drills and cultivators. It was founded in 1898 and its plant comprises 10 factory buildings, with about eight acres of floor space.

Gray Iron Castings Listed for More Than 2000 Uses

More than 2000 uses of gray iron castings are listed in a book issued by the Gray Iron Institute and distributed among the members. The publication is expected to be helpful to foundrymen in checking the outlet for their products and expanding uses for castings.

A. J. Tuscany, manager of the institute, announces that arrangements have been completed for presenting, to users of castings and others interested, information on the proper uses as well as properties of gray iron for different conditions. One phase of this educational work will consist of addresses before groups of manufacturers, engineering societies, technical bodies and other organizations. Prominent metallurgists will work with the institute in this activity.

Committees of various organizations desirous of having addresses on gray iron presented to their groups are invited to communicate with the institute, Terminal Tower Building, Cleveland, and speakers will be made available who have had particular experience along the line of each organization's special interest.

Shortens Annealing Time in Malleableizing

A new short-cycle annealing process for the production of malleable iron castings is announced by the General Electric Co. A number of advantages have resulted from the use of the new malleableizing process, particularly a saving of many days.

Details of the new method were worked out in the Erie foundry of the General Electric Co. Three electric annealing furnaces are used for this purpose at the Erie plant, each rated 325 kw. and using nickel-chromium ribbon resistor heating elements. The connections are arranged to allow a power input of 52, 170 or 325 kw. as desired. The capacity of the installation is 100 tons of castings per week.

In operation the hard castings, of commercial composition, are packed on the car bottoms or without iron plates or boxes, depending on the nature of the load. It was found that best results were obtained by stacking the charge directly on the floor of the car.

The charge is then placed in a furnace and heated to a sufficiently high temperature to effect solid solution of free cementite, whereupon the charge is transferred without removing from the car, to another furnace for cooling. In this furnace the castings are brought to a temperature below 750 deg. C., which is held for approximately 4 hr., after which the temperature is suddenly lowered a few degrees and maintained at this lower temperature for another 4 hr., when this step is repeated. The castings are then transferred either to a cooling furnace or into the air, or they may be quenched immediately with increased strength and without brittleness. The average time for a 6-ton anneal is between 28 and 30 hr.

Tests taken by the General Electric Co. show that the tensile strength, yield point and other characteristics are practically the same with the short-cycle anneal as with the older methods. It was found that the short-cycle malleable iron machines better than the long-cycle product, and shows no signs of framing or reversion. Very little skin is found and the castings clean somewhat easier than the old type of product. The castings may be galvanized without embrittlement and without previous or subsequent treatments. Warpage is also found to be reduced.

Shipments Through Sault Ste. Marie Canals

Iron ore passing east-bound through the United States canal at Sault Ste. Marie, Mich., in August totaled 10,547,401 net tons. Pig iron passing through east-bound totaled 5627 net tons, while the Canadian canal carried an additional 4876 tons of pig iron. Iron ore passing west-bound through the American canal amounted to 14,560 tons. Manufactured iron and steel moving west-bound was 7477 net tons through the American canal and 7448 tons through the Canadian canal.

The iron ore moving east-bound constituted almost 94 per cent of the total east-bound freight through the American canal and about 92 per cent of the total east-bound freight through both canals. The Canadian canal passed less than 3 per cent of the total freight, but 55 per cent of the number of passengers.

Chemical Show in Germany in 1930

The sixth general exhibition of the German chemical industry (*Achema*) will be held at Frankfort-on-Main June 10 to 22, 1930. The show will occupy 20,000 sq. m. (215,200 sq. ft.) of floor space, as compared with 562 sq. m. (6047 sq. ft.) in the first exhibition, which was held in 1920 at Hanover. Fully one-half of the space at Frankfort has already been taken by German companies, and English and American manufacturers are also expected to participate in the exposition. Corrosion resistant materials developed for chemical purposes will be among the features of the exhibits.

Concurrently with the show the following organizations will hold meetings: the Association of German Chemists, the Combustion Society, the Associated German Equipment Builders' Societies, the German Society for the Chemical Equipment Industry, the German Rubber Association, the Association of Rubber Chemists and Engineers. Full particulars regarding the exhibition may be obtained from the Deutsche Gesellschaft für chemisches Apparatewesen, Seelze, near Hanover, Germany.

Aluminum Production Increasing

All indications seem to show that the world's production of aluminum is steadily increasing, according to C. L. Mantell, writing for "Mineral Industry, 1928." The last year has witnessed the opening of several new plants, as well as extensions and enlargements of older ones. It is difficult to state how much of the world's production is controlled by the Aluminum Co. of America and Aluminium Ltd., and how much by the organizations affiliated with the Cartel. It is believed, however, that the first group now controls more than half of the production of the world.

The value of new aluminum produced in 1928 in the United States was $47,899,000, an increase of 22 per cent as compared with 1927. As in previous years, the principal producing plant was the Massena, N. Y., works, the remainder coming from Niagara Falls, Alcoa, Tenn., and Badin, N. C. No new production capacity was under construction in the United States in 1928, although there had been considerable extension of fabricating facilities, particularly for sheets and strong alloys.

The secondary production is becoming of greater and greater importance. It is now the usual thing that for every two pounds of virgin metal production somewhat more than a pound finds its way back as scrap for reworking as remelt aluminum or its alloys. The secondary-metal business has been constantly developing in its technology, and raising the quality standards of its products.

Imports of metal during 1928 markedly decreased, from 68,389,641 lb. in 1927 to 37,895,832 lb. in 1928. As in previous years, the metal imported is chiefly ingot, scrap or alloy. The exports of aluminum show a considerable increase, particularly in fabricated products such as plate. The total amounted to 16,732,238 lb., valued at $6,891,490.

Philadelphia Meeting Will Cover Industrial Heating

Included among the papers scheduled for the third national fuels meeting of the American Society of Mechanical Engineers are the following on industrial heating:

"Economics of Industrial Heating Practice," by J. A. Doyle, vice-president, W. R. Rockwell Co., New York.

"Electricity for Industrial Heating Furnaces," by W. S. Scott.

"Gas for Industrial Heating Furnaces," by H. O. Loebell.

"Oil for Industrial Heating Furnaces," by Leod D. Becker.

Arrangements are being made for a meeting of unusual size and of prime importance. The dates are Oct. 7 to 10, inclusive, and the place, Philadelphia, at the Bellevue-Stratford Hotel. Besides the industrial sessions, there will be meetings for stoker, power plant, smoke abatement and domestic heating topics.

To Head Bureau of Foreign and Domestic Commerce

WASHINGTON, Sept. 17.—The name of William L. Cooper, commercial attaché at London, was sent to the Senate yesterday by President Hoover to be director of the Bureau of Foreign and Domestic Commerce, Department of Commerce, to succeed Dr. Julius Klein, who has been made Assistant Secretary of Commerce.

Mr. Cooper, born in Saginaw, Mich., in 1878, is a graduate mechanical engineer from the University of Michigan. In 1901 he was associated with Robert W. Hunt & Co., Chicago, as assistant mechanical engineer, with headquarters in London. From 1902 to 1917 he was European manager and principal engineer for that company, with headquarters in London. In the latter year he established his own offices in New York, serving as engineer and purchasing agent for clients in foreign countries. He reorganized the technical inspection of the supply division of the Emergency Fleet Corporation in 1918 for one of its districts and later was made district manager.

He formed a partnership in 1919 with R. D. McCarter, and was engaged as consulting engineer, purchasing and shipping agent in America for clients abroad. In 1926 he was appointed commercial attaché, London.

Lower Earnings in New York Factories

Average weekly earnings in representative factories in New York State are reported by the State Industrial Commissioner to have been $29.80 in July. This is the lowest figure since last January. It compares with $30.02 in June, with $30.35 in March, the highest peak ever reached, and with $29.15 in July, 1928.

Making Rustless Iron Wire, Sheets and Strips

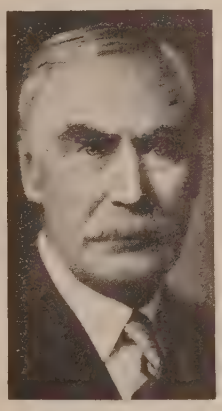
The Superior Steel Corporation, Pittsburgh, which, as mentioned in THE IRON AGE last week, has been appointed sales agent for the Rustless Iron Corporation of America, Baltimore, is also now in production on cold rolled strip steel made from ingots supplied by the Rustless Iron Company. The American Sheet & Tin Plate Co., Pittsburgh, is also utilizing the Baltimore company's rustless iron for the rolling of sheets, and it is reported that the Copperweld Steel Co., Glassport, Pa., will soon begin the manufacture of cold drawn wire from the product.

The Rustless Iron Corporation is the operating subsidiary in this country of the International Rustless Iron Corporation, and produces at its Baltimore plant rustless iron under a process covered by the Wild patents, which are owned by the International company. These patents use chrome ore as a base material.

Two grades of rustless iron are now being made. The company contemplates the building of a larger electric furnaces at Baltimore, and it is reported that a plant location in the Pittsburgh district is being sought.

James A. Campbell Honored on 75th Birthday

JAMES A. CAMPBELL, president of the Youngstown Sheet & Tube Co., celebrated his seventy-fifth birthday by entertaining a group of friends in the steel industry over the week-end at his home, Loganbrook, north of Youngstown. Included in the group were Charles M. Schwab, chairman, and Eugene G. Grace, president, of



JAMES A. CAMPBELL

the Bethlehem Steel Corporation; Samuel Mather, John L. Severance, H. G. Dalton, Harris Creech, John Chandler, Elton Hoyt II, and J. P. Williams, Cleveland; E. A. S. Clarke, Arthur J. Singer and L. J. Campbell, New York; C. D. Caldwell and E. H. Stillman, Chicago; and from Youngstown, A. E. Adams, John W. Ford, T. J. Bray, Richard Garlick, William B. Gillies, E. T. McCleary, L. A. Manchester, Walter E. Meub, W. J. Morris, Frank Purnell, W. C. Reilly, C. S. Robinson, John Tod, W. E. Watson and R. M. Welch.

Wednesday evening, Sept. 11, the date of his birthday, Mr. Campbell was tendered a testimonial dinner at the Ohio Hotel in Youngstown, attended by 400 representative citizens of the Mahoning Valley. A. E. Adams, president, First National Bank, and a director of the Sheet & Tube company, presided. Addresses were delivered by Mayor Joseph L. Heffernan, Dr. I. E. Philo, John T. Harrington, E. T. McCleary and L. A. Manchester.

At the conclusion of the program, Mr. Adams read a testimonial, applauding President Campbell's achievements and his untiring efforts in behalf of Youngstown. The latter responded briefly.

President Hoover sent to Mr. Campbell the following telegram:

"Permit me to join with your other friends in extending to you heartiest congratulations upon your seventy-fifth birthday."

At 75, President Campbell, apparently in the prime of life, has no thought of retiring and intends to "carry on" so long as his health permits. He is at his office virtually every day except when he is in New York on business, and keeps in active touch with all the affairs of his corporation.

United States Uses 41 Per Cent of World's Tin

During 1928 the United States consumed 73,270 tons of virgin or primary tin, representing 41 per cent of the world's production of approximately 178,000 tons, according to a report of the United States Bureau of Mines. The consumption for tin plate and terne plate manufacture, accounting for 37 per cent of the total, represents the principal single use for tin in this country. Last year the tonnage for this purpose showed a gain of 10 per cent over the previous year, the increase having been caused by general industrial expansion and by larger manufacture of canned goods. The growing practice of lap-welding and die stamping tin cans has lessened the demand for solder in canning operations and consequently for much tin. Further data in regard to this subject are contained in circular 6165, "Consumption of Tin in the United States During 1928," published by the United States Bureau of Mines, Department of Commerce, Washington.

Diamond Chain & Manufacturing Co., Indianapolis, has completed a four-story office and administration building, the two lower floors of which will be used for manufacturing purposes. The space formerly occupied by the office, engineering and drafting departments has been converted into a manufacturing department. A new one and a half story addition is being used for steel storage. These changes have added 40,000 sq. ft. to existing manufacturing space.

Inland Steel Co. has painted an airport marker on the roof of its Milwaukee plant, carrying the name "Milwaukee" in high visibility yellow paint on black background. The sign is 80 ft. long, 20 ft. wide and will be lighted at night. An arrow, 60 x 20 ft., yellow on black background, points southeast toward the municipal airport.

Oil Transfer Corporation, 17 Battery Place, New York, has placed a contract with Ingersoll-Rand Co. for an 800-hp. direct reversible marine oil engine for installation in its new tugboat which is being built by the Spedden Shipbuilding Co.

Metal Supplants Wood in New Cabin Plane

The tendency to supplant wood with metal in the manufacture of airplanes is indicated in a statement of engineers of the Ryan Aircraft Corporation, St. Louis, that only 298 lb. of wood is used in the new six-place Ryan Brougham cabin plane. This includes all the wood used in the construction of the wing, fuselage, fairing and other parts. The ship weighs 2250 lb., less gasoline, oil, passengers and pilot. Thus in this plane only 17 per cent of the entire construction is of wood, and, with the exception of the wing, there is no strain on any of the wood parts.

"This tendency to eliminate wood from airplane construction has resulted in much safer, stronger and lighter construction," the engineers state. In a Ryan plane the pilot and passengers are now surrounded by a steel tubing structure which protects them from injury, even in a crash.

Steel propellers have been substituted for the old wooden ones. Instrument boards are made of micarta, cabin frame work is largely of aluminum, and wood is used only for the wings, fairing and as a frame work for upholstering the cabin.

August Construction 25 Per Cent Less Than July

Construction contracts awarded in August in the 37 States east of the Rocky Mountains totaled $488,882,400, according to the F. W. Dodge Corporation. This represents a drop of about 25 per cent from July and is 5 per cent lower than in August, 1928. Only two of the eight districts show increases over July. In contemplated new work, however, seven of the eight districts show increases, the total having been $657,832,000, or 37 per cent more than in July.

Residential building contracts continue to lead, but with a considerably lower percentage of the total than has prevailed for several years. In August this type of construction accounted for $146,088,200, or 30 per cent of all, compared with 35 to 40 per cent or more, which has prevailed monthly for a long period. Public works and utilities in August accounted for $119,287,800, or 24 per cent. Industrial buildings called for $75,265,000; commercial buildings, $71,955,400; educational buildings, $32,349,400.

Totals for eight months have aggregated $4,156,865,000, compared with $4,545,270,000 for the corresponding period of last year.

Peden Iron & Steel Co. Buys Wilson Hardware Co.

The Peden Iron & Steel Co., Houston, Tex., wholesale hardware and mill supplies, has purchased the E. L. Wilson Hardware Co., Beaumont, Tex., engaged in a similar line of business. E. G. Edson, formerly president and general manager of the Wilson company, and Virgil Keith, a former vice-president, whose father for 25 years was president of the Wilson company, have been added to the board of directors of the Peden company and will continue in active capacities with the organization. The stores of the Wilson company will be continued.

New Laclede Tube Mill to Be Ready in January

Standard merchant pipe from ⅜ in. to 4 in. in diameter and mechanical tubing and electrical conduit, both enameled and galvanized, will be manufactured in the tube mill of the Laclede Steel Co., St. Louis, being erected at Alton, Ill. This mill, which is the first pipe plant in the St. Louis district, will begin production in January and will employ over 200 men. Complete finishing equipment for galvanizing will be a feature of the plant.

Link-Belt Co., Chicago, has appointed the following district sales agents for its line of cranes, shovels and draglines: James Van Buskirk, 911 Martin Building, Birmingham, for Alabama; Clyde Co., 309 Magazine Street, New Orleans, for Louisiana and most of southern Mississippi; Holloran Tractor Co., 188 Butler Street, Memphis, Tenn.; Ensminger & Co., 181 South Washington Street, Wilkes-Barre, Pa.; United Hoisting Co., 136th and Locust Streets, New York; Charles L. Miller, Denver and Salt Lake City.

Employment and Payroll Totals in Identical Plants in July and June (a)

	Establishments	Number on Payroll		Weekly Payroll (b)	
		July	June	July	June
Iron and steel	208	285,362	287,502	$8,867	$9,440

Aircraft Makers Bought by Allied Motor Industries

Allied Motor Industries, Inc., operating American Cirrus Engines, Inc., Belleville, N. J., maker of aircraft motors, and the Great Lakes Aircraft Corporation, Cleveland, manufacturer of airplanes and parts, has acquired a controlling interest in the American Aeronautical Corporation, 730 Fifth Avenue, New York, maker of seaplanes and amphibians of the Savoia-Marchetti type.

The last-named company has a plant at Whitestone, L. I., but will soon transfer its operations to Port Washington, L. I., where it is now constructing a factory. One section of the building is nearing completion and the entire plant, of U-shape, will have 24,000 sq. ft. of floor space, and will cost $100,000 with equipment. The main floor will be devoted to manufacturing, while a second floor will be used for classrooms for a seaplane school. A seaplane terminal is also being built.

Foundrymen's Board Holds Annual Meeting

The annual meeting of the board of directors of the American Foundrymen's Association was held at the Hotel Statler, Cleveland, Sept. 12, and the new officers elected at the Chicago convention were installed. These are: President, Fred Erb, president, Erb-Joyce Foundry Co., Detroit; vice-president, N. K. B. Patch, secretary, Lumen Bearing Co., Buffalo; directors: F. J. Lanahan, president, Fort Pitt Malleable Iron Co., Pittsburgh; Harold F. Falk, vice-president and works manager the Falk Corporation, Milwaukee; Arnold Lenz, manager of the Gray Iron Foundry of the Chevrolet Motor Co., Saginaw, Mich., and Delos H. Wray, Henry Wray & Son, Inc., Rochester, N. Y.

Plans were made for the next annual convention and exhibition, which will be held in Cleveland, May 12-16. It was decided to have as an added feature of the exhibit a large technical and educational exhibit.

138 Steel Ships Under Way

WASHINGTON, Sept. 17.—On Aug. 1, American shipyards were building or under contract to build for private owners 138 steel vessels of 141,552 gross tons, as compared with 174 steel vessels of 150,782 tons on July 1, according to the Bureau of Navigation, Department of Commerce.

More than 300,000 commercial users of tin and copper are now in business in the United States, according to a preliminary survey by the National Metal Exchange. This figure includes only individuals or corporations fabricating or purchasing articles made of these metals in sufficient quantities to be materially affected by price fluctuations.

Little Movement in European Markets

High Production Costs for British Pig Iron—German Steel Plants Use Much Power—Japan to Expand Rolling Mills

(*By Cable*)

LONDON, ENGLAND, Sept. 16.

INCREASED production costs are hampering expansion of pig iron output and Cleveland makers are generally sold out to the end of October. Most of this business is for domestic delivery, as export buyers are unwilling to pay the advanced prices.

Hematite iron prices are gradually rising, but as a higher market will jeopardize increased export business it is believed that some furnaces may suspend.

Finished steel business is generally quiet, but inquiries are in moderate volume. Most mills rolling light weight material are well occupied, but plate mills are still in need of orders, especially for shipbuilding.

British exports in August were 38,000 tons of pig iron, of which the United States received 3000 tons. Total iron and steel exports were 358,000 tons.

British consumers of Continental sheet bars have bought heavily of late, but otherwise the market is quiet with transactions delayed until after the Cartel meeting. Tin plate prices are strong as a result of good buying and 18s. 7½d. ($4.51) per base box f.o.b. works port has been paid, with 19s. ($4.60) per base box now asked by mills which are well engaged. Works are well sold up to the end of the year and recent inquiries are for delivery into the first quarter.

Galvanized sheets are quiet but prices are steady, although Indian demand has not improved. Black sheet business is dull and mills rolling Japanese light gage specifications have reduced prices.

Ashmore, Benson, Pease & Co., Stockton-on-Tees, will build a blast furnace with a weekly capacity of 3500 tons of pig iron for the new Ford works at Dagenham. The new furnace will be the largest in the United Kingdom. The Albion Motor Co., Glasgow, has secured a £200,000 ($970,000) contract for 190 6-wheel motor cars from the Indian Government.

German Contracts Omit "Force Majeur" Clause

HAMBURG, GERMANY, Sept. 3.—A feature of the steel market is the willingness of domestic and export buyers to pay premiums of 1s. 6d. to 2s. 6d. (36c. to 60c.) a ton for prompt shipment. This has been due to the fact that sellers are now guaranteeing compensation to the buyer for delays and are waiving the "force majeur" clause in their contracts. Omission of the "force majeur" clause is unusual, and Belgian and Luxemburg steel mills, in most cases, have been disinclined to take such action. Consequently, German sellers have been booking a considerable tonnage for delivery in 25 to 26 days after acceptance of the order. Business on this basis has included bars, beams, and other heavy material.

Japanese Rails May Go to American Mills

NEW YORK, Sept. 17.—Exporters to Japan have been obtaining bids from American mills on about 10 miles of 75 and 100-lb. rails for the Nankai Electric Railroad. Although these sections are obtainable in Japan from the Government Steel Works, which has a large capacity for rail production, exporters believe that the early shipment specified by the railroad may bring the order to the United States, as deliveries from both the Japanese and the European mills are delayed.

Bids received by the Nippon Oil Co. in Japan on its recent inquiry for about 50,000 base boxes of oil sizes of tin plate were unsatisfactory and, as the material was for next year's requirements, purchase has been postponed. On its previous quarterly purchase of tin plate, quotations by British mills were low and American bids were high, so that the order went to the British. On the

recent inquiry the positions of American and Welsh mills were reversed, mills in the United States being the low bidders for the business.

To Make Concrete Products from Slag

DUSSELDORF, GERMANY, Sept. 2.—The Vereinigte Stahlwerke A. G. is constructing a plant near Duisburg, which will use blast furnace slag in the production of concrete paving stones, brick and pipe. It is to be the largest plant of its kind in Germany, with a capacity of 1500 to 1700 tons. Most of the output will go to Dutch contractors.

German Steel Industry Leads in Power

HAMBURG, GERMANY, Sept. 3.—An investigation of horsepower per employee used in German, British and American industries made by the Reichscreditgesellschaft, Berlin, and the German Business Research Institute, shows Germany leading slightly in the iron and steel plants and in coal mining. In blast furnaces and steel mills the per capita use in 1928 was 17.5 hp. in the United States, 18.7 in Germany and 11.1 in Great Britain. In coal mining per capita horsepower was 4.9 in the United States, 7.7 in Germany and 5.4 in Great Britain.

In shipbuilding, however, Germany lagged with only 3.4 hp. per capita, compared with 3.9 per capita in Great Britain and 6.2 in the United States. In the automobile industry per capita use was 2.8 hp. in the United States, 1.4 in Germany and 1.3 in Great Britain. In the investigation, all plants employing 50 or more men were included.

Japan to Expand Mills

HAMBURG, GERMANY, Sept. 3.—Machinery builders are negotiating for some substantial contracts with Japanese steel mills, which are planning increased production of wire rods, sheets and plates. Representatives of the Japanese works have arrived in Germany to inspect German equipment, and a large share of the business is expected to be placed here.

Oppose Copper Rebate

HAMBURG, GERMANY, Sept. 3.—Copper smelters have requested the railroads to consider gradual abolition of the special freight rates from ports on imports of copper, pointing out that German production during the next year will be considerably increased. At present a refund of 40 per cent of the freight rate is granted to large copper consumers.

Bethlehem Steel Co. has purchased from H. A. Brassert & Co., Chicago, three disintegrators for the fine cleaning of blast furnace gas.

Manganese Producers Say 1½c. Duty Is Essential

WASHINGTON, Sept. 17. — The American Manganese Producers' Association at its second annual convention here last week adopted a resolution "that a tariff of 1½c. a lb. on the metallic manganese content of all ores containing more than 25 per cent manganese with protection for low grade ores is absolutely essential and nothing less will provide adequate protection for the domestic industry. The association stands solidly behind the tariff provisions as contained in Senator Oddie's amendment."

The Oddie amendment provides for a duty of ½c. a lb. on the manganese contained in ores running from 10 to 20 per cent manganese, 1c. a lb. on ores running from 20 to 25 per cent, and 1½c. a lb. on ores containing manganese in excess of 25 per cent, ores containing less than 10 per cent remaining on the free list.

New Mileage Freight Rates Postponed to Dec. 20

WASHINGTON, Sept. 17.—An order made public last Thursday by the Interstate Commerce Commission postponing from Oct. 20 to Dec. 20 the effective date of the general Eastern steel rate case decision has aroused interest as to whether the proceeding will be reopened for further consideration. The order provides, however, only for postponement of the effective date. At the same time it is recalled that reopening and reargument were requested of the commission not only by the railroads but by a number of shipper organizations.

The railroads, as pointed out in THE IRON AGE of Aug. 29, page 553, particularly objected to the so-called fourth section (long-and-short-haul) order in the decision and declared that they could not publish any mileage scale of rates, which were set up in the decision, without having adequate fourth section relief. Because of this situation agents for the railroads said they were preparing a new fourth section application "in order to make the relief adaptable to and consistent with the distance scales."

Among shipper organizations asking for a postponement of the effective date and a rehearing of the case were those in northern New Jersey cities. Removal of these points from the New York City rate group on traffic afforded rail service only was sought. The Port of New York also asked for reopening of the case in order that a number of points might be "cleared up."

The decision covered all rates on manufactured iron and steel products throughout Official Classification territory. It follows a prolonged investigation under the Hoch-Smith resolution and was the most sweeping iron and steel rate case ever passed upon by the commission.

New Steel Plant Safety Record Made by Armco

A new safety record for a steel plant is thought to have been established by the East works of the Middletown, Ohio, division of the American Rolling Mill Co. when it completed at midnight, Sept. 8, 1,158,000 man-hours without a lost-time accident. This is equivalent to 45 consecutive days for over 3700 men. The new record supplants that made on June 29 by the Butler, Pa., works of the Columbia division of Armco, which had finished 66 consecutive days, but only 1,006,135 man-hours, without a lost-time accident.

Aluminum Plant in Hungary

HAMBURG, GERMANY, Sept. 3.—The interests controlling most of the Continental bauxite deposits are preparing to establish an aluminum plant near Budapest, Hungary, with a capacity of about 1500 tons a year. This will be the first aluminum plant in Hungary, which heretofore has imported its requirements of about 2000 tons of aluminum annually from Switzerland and Germany.

Production and Shipment of Raw Materials and Finished Products

This Issue in Brief

Multiple drill set-up time reduced more than two-thirds by use of cluster plates. Screw bushings in the holes in plates permit the tools to be set accurately for depth.—Page 728.

* * *

Machinability of "short-cycle" malleable iron is better than that of "long-cycle" product, says maker of new equipment. The 28 to 30-hr. anneal is said to produce a casting with very little skin and with reduced warpage. —Page 776.

* * *

High level of business activity to continue, economist judges from indications. No signs yet that high money rates have handicapped business.—Page 774.

* * *

Butt welds thin sheets automatically with a joint 85 per cent efficient. Insulated conductor loop, placed close up under copper backing bar, counteracts the "blow" caused by clamps and backing bar.—Page 742.

* * *

Nitriding in molten salts cuts nitriding time sharply, say metallurgists. Very satisfactory results are claimed, with a case of 0.005 in. obtained in one to two hours. Case is said to be three times as hard as that by ammonia hardening.—Page 740.

* * *

Tests coupons cut from welds in the field. Portable testing machine contains a hand-operated hydraulic pump, which subjects the weld to a tension test.—Page 741.

* * *

All steels have same torsional strength at 900 deg. C., tests reveal. But the angles of twist, in novel test conducted by engineer, vary widely and unaccountably.—Page 734.

Cadmium demand rapidly increasing. Growth in consumption of cadmium for plating, solders and alloying has greatly increased production. Practically all cadmium comes from treatment of impure zinc solutions used for preparing electrolytic zinc.—Page 729.

* * *

Failures practically eliminated by subjecting connecting rods to deflection test. Rod is placed on V-blocks with middle of web underneath a notched bar, to which weights are attached. Compressed air keeps bar free of rod until load is to be applied.—Page 728.

* * *

Structural steel fabrication and erection record is aided by use of radial drills mounted on wheels which run on T-head rails, permitting the machines to be moved along the work. Framework of 71-story bank building will be completed in less than four months.—Page 730.

* * *

Hones bearings and throws of crankshafts simultaneously. Honing heads on special machine are adjustable vertically and horizontally. They need to be set only once for a given size of crankshaft.—Page 728.

* * *

Plain carbon steels can be nitrided just as hard as nitralloy steels, metallurgist declares. The steels must be put in the sorbitic condition, but nitriding steels require higher temperatures and a severer quench. Advocates duplex nitriding—at high, then low, temperatures.—Page 740.

Cast iron not far behind alloy steels in resistance to sea-water corrosion. Five-year test proves 36 per cent nickel steel to be most resistant of all metals tested. Next is 13.5 per cent chromium, although cast iron is nearly as good.—Page 742.

* * *

Electric flaw detector may solve problem of non-destructive weld testing. An attempt is being made to adapt to this purpose the machine now satisfactorily used for rail tests. It detects openings of microscopic widths. —Page 741.

* * *

What causes nitriding hardness? No adequate explanation has been made as yet, although it seems to be caused by space lattice distortion.—Page 739.

* * *

Blue brittleness not due to nitrogen, says metallurgist. As proof, he cites that Izett steel, with 0.017 per cent nitrogen, is free from this phenomenon, while soft steel containing only 0.008 per cent nitrogen is very brittle at 300 deg. C.—Page 734.

* * *

Gets maximum value out of convention by assigning certain men to "cover" certain sessions. The men meet at the end of each day to compare notes.—Page 736.

* * *

"Delivery premiums" absent in period of record steel demand. Steel industry, though crowded to make deliveries, did not attempt to advance prices on that account. Whether or not a decline in demand will bring with it lower prices depends largely on sellers, as the natural tendency of the buyer is to be on the lookout for price reductions.—Page 782.

ESTABLISHED 1855

Steel Output and Prices

EVERY time steel prices have weakened the criticism has been made, and rightly, that some producers were trying to sell a greater tonnage than the state of demand warranted. It will now be in point, therefore, for sales executives to reflect that the steel trade has been in a period of altogether exceptional demand. There is a wide gap between averages and the records recently made. It is human nature to think of records rather than averages and we bring too much of the sporting idea into business. It is quite proper to think of the record high jump in athletics rather than the average of all the jumps that men have made. But athletics is purely competition and steel is something else.

Reference should be made to the graph on page 685 of last week's IRON AGE, depicting the course of steel ingot production since the beginning of 1921 and the general trend line of the period. A big bulge in steel production began at the middle of last year. The graph shows for several years the familiar course of production declining somewhat from the first half to the second half, and last year is conspicuous by not having that decrease. June, the low month of last year, was simply on the general trend line; subsequent months were well above it, while all of this year has been far above.

The trend line in the graph is mathematically accurate, having been computed. One might say that these are new times and we ought to be above the general line; but as a matter of fact the comparison really runs a little bit the other way, in that the computation includes the very poor year 1921. That pulls down the first point in the trend line, while the heavy production of last year pushes the last point up. The trend line in the graph probably has a greater slope upward than a trend line would have if computed by omitting 1921 and 1928. Even the trend line given, however, crosses the end of this year at 150,000 tons daily steel ingot production. That would be nearly one-fourth under the peak rate of last May and one-fifth under the average rate this year to Sept. 1.

Will sales executives conduct themselves during the next few months in the light of these facts? In the long run the total of demand will conform to the general trend. It cannot always run along at the peak. In the past every peak has been followed by a trough, the only variation having been as to when the trough came and how deep it was. We are now speaking only of the trend line, not suggesting a dip in future below the line.

So far as we are aware the buyers of steel are not asking for lower prices. They certainly must feel that the industry treated them well this year, when for the first time in six years it was really crowded to make deliveries and fell behindhand, yet did not attempt to advance prices on that account; and there were none of the "delivery premiums" that were often so marked before the war.

By no means does it follow that the individual buyer will not be on the lookout for lower prices. His position is entirely natural. Without having any wish that the market price of a finished steel product should decline, he certainly wants to get the benefit of any concession and his only course is to try the thing out for himself. Granting that it is to the advantage of buyers as a class to have steady prices, the individual buyers cannot be expected to cooperate to that end. They are as suspicious of each other as are steel sellers. It is more the function of sellers than of buyers to hold prices.

Greater Future for Material Handling

"YOUR labor-saving equipment is wonderful, but in Europe it would not pay. Wages are too low."

So often has the remark been made by visitors to the United States that it is widely accepted as a statement of fact. It remained for Americans operating in a foreign country to prove the contrary. How the Guggenheim interests successfully replaced labor where it is cheap was told in an article in THE IRON AGE of Sept. 12, on the methods introduced in their Chilean nitrate operations. Not merely justifying its cost, but revolutionizing the entire nitrate industry in the South American republic, the achievement of the Guggenheim company is fairly epoch-making.

While the specific application of handling mechanism to the production of nitrate may not be of direct interest to metal-working companies, the broad lesson it teaches is far-reaching. Aside from demonstrating that cheap labor can be replaced, the Chilean operation makes it clear that such a result requires more than the purchase of material-handling machines —it rather means the solution of a difficult engineering problem through the correlation of methods and equipment in a smoothly working, integrated system.

As the conception of mechanical handling as a distinct branch of engineering gains ground the list of possible economies will multiply. In an interview in this issue of THE IRON AGE, Harry L. Horning, president of the Waukesha Motor Co., explains that each operation in his plant is given special study from a material handling point of view; but he adds: "We are convinced that the greatest opportunity for

further economy lies in reducing the time of putting a piece in a machine and taking it out."

With the perfection of mechanical handling, more will be heard of technological unemployment. In some aspects it may be regrettable that men have been displaced by machines ever since the industrial revolution, but it cannot be gainsaid that in the long run all classes of the population have benefited. Moreover, so far as the individual manufacturer is concerned, he has no alternative. As Mr. Horning says, cost reduction is prerequisite to greater volume and volume is essential to cost reduction.

Robbing East to Pay West

ONCE on a time Colorado was a great mining State and Telluride, in the San Juan region, was one of its bright centers. Mines are exhaustible, however, and rather long ago the mining industry of the State had seriously waned, including mining at Telluride. The Smuggler-Union mine at that place was one of the longest survivors, but recently its owner, a Boston company, bowed to the inevitable. The officers of the little Bank of Telluride did not appreciate that mines die, even as did Methuselah, and allowed that local institution to become insolvent.

In order to avert loss to his creditors and depositors, C. D. Waggoner, president of the bank, devised and executed a plan to get contributions aggregating half a million dollars out of six New York banks. In bankers' code, which as a banker he possessed, he telegraphed instructions in the name of several Denver banks to their New York correspondents to transfer sums to the Chase bank to the credit of the Bank of Telluride. Then, as president of the latter, he presented himself at the Chase bank, satisfactorily identified himself, and obtained payment from it, which he used to settle New York indebtedness of his own bank, remitting the remainder for the benefit of its depositors and keeping nothing for himself.

There have been editorial remarks on the gullibility of the six New York banks that were robbed. Apparently, however, the whole procedure was in regular banking order. The only surprising feature in this respect is that the bankers while using a code among themselves do not have a system of identifying indicators such as are employed in cable communication, unerringly establishing the authority for sending a dispatch. Mr. Waggoner as a banker might properly have the bankers' code, just as many commercial houses possess the Bentley code, but he should not have known the identification of any Denver bank any more than the combination of its safe. This simple system is, of course, an adaptation of the insolvable book cipher. We are aware that the rules of our telegraph companies do not permit the use of indicators in domestic correspondence, but they do not prohibit keyed signatures.

Mr. Waggoner, when apprehended, readily admitted that he was guilty of criminal acts, but justified them on the ground that Wall Street had shut down the mines of his district, wherefore it ought to pay damages, even if vicariously. Moreover, he thought it essentially right to take money from rich persons in the East and give it to poor people in the West. Finally, the six big New York institutions would not greatly miss $500,000, anyhow.

Most of our readers will immediately agree that this reflects insanity and will expect that Mr. Waggoner will become a subject for the alienists. Yet is it not true that he is but making a raw, naive expression of the idea that is in the heads of many persons in the West, and in the heads of their exponents in the Senate of the United States, whom we miscall progressives and otherwise characterize as agrarians or the mental heirs of the populists?

More and More Art in Metal Display

AN editor who goes to many meetings and expositions is liable to acquire the idea that one exposition in the metal trades is like another, perhaps more so. But even a casual glance at the Eleventh National Metal Exposition held last week in Cleveland impressed him that here was one that was different—notably better looking than any predecessor. Analyzing the situation, discounting the imposing surroundings in the Public Auditorium and the quiet, restful illumination, he concluded that the effect was due to a very liberal use of bright metal.

Manufacturers seem at last to have taken to heart the facts that architects, artists and decorators have known for long and are using to a growing extent; namely, that beautiful effects can be created with stainless steel, silvery aluminum, red copper and yellow brass, and that bright metal of all sorts has a pleasing luster that is obtainable in no other medium. As time goes on and the booth designers become more skilled in developing the possibilities of metal they will undoubtedly learn how to balance correctly the bright metal against a velvety background and harmonize the lighting effects into an ensemble which delights the eye. Without making invidious comparisons, it is worthy of note that the Aluminum Co. of America, in most discouraging surroundings in the annex, was able to erect an exhibit of great artistic merit, one which will stand out as a leader in the movement toward the adequate and beautiful displays of metal products we shall see in the future.

Scrap Supply and Prices

DEALERS in scrap iron and steel have wondered why their market in the past 60 days has not been stronger, in view of the fact that steel ingot production has been 90 per cent or more of capacity, and that the supply of steel works grades, particularly of good heavy melting steel scrap, has not seemed overplentiful. One explanation is that the governing factor in prices is how quickly steel manufacturers must have shipments on their purchases. If there is strong pressure for deliveries of finished steel products, the method commonly used in meeting such a condition is to speed up steel-making operations, and that is often accomplished by increasing the ratio of scrap to pig iron in the charge. The scrap metal having been once refined does not require nearly so long a time in the bath as does pig iron.

It is only necessary to go back to the early part of the year to find that scrap prices showed greatest strength coincident with the heavy advance orders in

steel products and an insistent demand for prompt shipments. When the mills began to catch up with their obligations the need of forced steel production abated, and with it the demand for scrap.

The supply of scrap naturally has an influence on prices, but it is to be questioned if it is as much of a factor as the manner in which steel makers want deliveries. Technically scrap is scarce on a rising market, because those who produce it not only want to get as much for it as possible, but are encouraged to hold it by active and widespread competition, usually an accompaniment of a strong market. Conversely, supplies are always plentiful in a declining market. There is probably less variation in the actual supply than is indicated by the fluctuation in prices.

In stock market operations the ordinary impulse is to sell when prices are weak and to buy when the trend is strongly upward. The reverse is the method followed by those who have made fortunes in stocks. Next to the securities market comes the scrap market in its response to human impulses. This is due to the fact that since the beginning scrap dealers have been taking orders for something they had to buy and the business has evolved into one of matching wits. In the past two years the melter, rather than the dealer, has had the better of the contest.

Should there be any easing of scrap prices in the next 60 days, it would be due chiefly to more orderly purchases, since it is well established that the steel trade is back on a "purchase for requirement" basis. That suggests a like mode of steel raw materials purchases, and indifference on the part of steel makers invariably stimulates sales activity on the part of scrap dealers.

Circles and Spirals in Business

TRADE in the United States in the last seven years has been marked by a steadiness unparalleled by anything in the past, or, to put it in another way, we have had a period of activity unprecedented in length. That is the general and long-range view; but since the middle of last year we have had a period within a period, one of activity above the general rate of the seven years. The prolongation of prosperity had come to be an accepted fact, but now with this extra movement there is much discussion as to where we stand today.

It is largely a question of economics, or let us say a matter of circles or spirals. We recall the ascending and descending spirals of the past. But whatever language may have been used of late in describing the course of affairs over the seven years the meaning is the same, that we have been having a circle instead of a spiral. The essence of the problem is to determine whether our circle is developing into a spiral. In other words, is there a balance or are there elements in the activity which will produce still greater activity or will themselves fail?

It appears from the record to date that one suspected element has not worked out unfavorably. A couple of years ago there was much talk of "technological unemployment." Improvements had been made to preserve or increase profits, giving an appearance of prosperity, but men were being released from employment and the result might be decreased buying power. The mass production associated with these improvements required large buying power, and there appeared to be an element working for a descending spiral. The showing would be cumulative; but instead we now have less, not more, appearance of this technological unemployment.

A later fear has been in connection with the stock market. Profits, paper or otherwise, increased the volume of buying and produced better earnings for the corporations, raising their shares again, and thus making an element for an ascending spiral which could not keep going, for necessarily there would not always be a supply of fresh buyers or bidders in the stock market. This fear is still with us; but there are some who assert that buying of shares has become so selective that the menace is at least greatly reduced.

From another angle, the influence of the automobile industry needs to be scrutinized. A rise in the volume of automobile buying began last year and this year has reached spectacular proportions, statistically speaking. With such a new industry it is impossible to gage closely its influence upon general trade activity, but most observers insist that the influence is large. There can be no doubt that the buying of automobiles is particularly sensitive to changes in buying power, made by trade activity and what occurs in the stock market. Here we have an element plainly marked as capable of making a spiral, the influence in the recent past being upward, while there will be much doubt whether further increase in the influence can be expected.

Sees Danger in Growing Bigness of Big Business

The only "fly in the ointment" is the continued expansion of big business. And it is possible that the time may come when there will be only one corporation for each particular trade or industry. Such a possibility is suggested by the combination of a number of wholesale dry goods concerns recently effected in an effort to meet the competition of the chain store systems.

Such a combination is entirely logical, but it foreshadows the time when all dry goods stores will be under one management and competition will be ended. It is a development which leads directly to socialism or the passage of anti-trust laws far more drastic than those now on the statute books. Probably sleeping dogs will be allowed to sleep while times are good; but the bigness of big business is certain to be a political issue when the tide turns and prosperity begins to wane.—Theodore H. Price in *Commerce and Finance.*

Practically the whole of the scrap material from the ex-German battleships and cruisers raised by Cox & Danks, Ltd., at Scapa Flow, Scotland, has, according to *Engineer* (London), "found its way to America, Germany and Scandinavia, in which countries there appears to be a keen demand for the alloy steels and other special metals employed in naval construction."

Authorizes Steel Mill Bearings Research

Division of Mechanical Engineers Would Set Up Fellowship on Heavy-Duty Roller Bearings

SPECIAL investigation of roller bearings applied to the roll necks of rolling mills was authorized by a meeting of the iron and steel division of the American Society of Mechanical Engineers at Cleveland, Sept. 13. The report of a special research committee of the division, having to do with heavy-duty anti-friction bearings, recommended the establishment of a research fund of $4,000 for the use of a fellowship at the Carnegie Institute of Technology, Pittsburgh, under the direction of Prof. W. Trinks. The plan looks to a two-year program of study and tests, and, in accepting the report, the committee will probably canvass the industry in the immediate future to get together the money needed. Presumably bearing makers, builders of rolling mills and the steel mills themselves will be approached for support.

The committee, which is expected to have oversight in respect to procedure, is composed as follows: Prof. W. Trinks, Carnegie Institute of Technology, chairman; Bryant Bannister, National Tube Co., Pittsburgh; H. E. Brunner, chief engineer, S-K-F Industries, New York; George C. Farkell, superintendent of rolling mills, National Tube Co., Lorain, Ohio; S. G. Koon, associate editor, THE IRON AGE, New York; R. C. Stiefel, Ellwood City, Pa.; H. H. Talbot, chief engineer, United Engineering & Foundry Co., Pittsburgh; S. M. Weckstein, Timken Roller Bearing Co., Canton, Ohio.

The scope of the investigation as outlined in a preliminary way by the committee covers both hot and cold rolling. The classes in hot rolling are to include four-high strip mills and two-high merchant, billet and strip mills. In cold rolling both two-high and four-high strip mills are to come under the investigation. At the outset the committee expects particular attention will be paid to the methods to be used in determining neck pressure, such as hydraulic jacks under the housing screws or extensometer under the screws, or Brinell plates under the screws.

Among the data expected to come out of the research are pressures between rolls for different sections rolled, also the temperatures, reductions, speeds and power consumption with either plain or roller bearings.

195,000 Lb. of Tin Plate Scrap Detinned a Year

About 195,000 tons of tin plate scrap are treated annually at detinning plants, according to information obtained by Horace W. Johnson, examiner for the Interstate Commerce Commission and submitted to that body in a freight rate matter.

During the past few years, the report points out, improved methods of tinning metal sheets have greatly reduced the amount of surface tin, which has rendered tin plate scrap less valuable and less profitable to handle. The examiner declared that at present the recoverable quantity of tin from tin plate scrap does not exceed 1.4 per cent. In 1925, the report stated, the recovery of tin by the Vulcan Detinning Co. was 36.7 lb. per gross ton of tin plate scrap, while in 1928 it amounted only to 29.7 lb.

Since 1928, it was said in the report, the detinning plants have furnished an outlet for tin plate scrap and have created a movement of considerable tonnage, not only of the tin plate scrap itself but also the recovered sheet steel scrap, the tetrachloride of tin, tin oxide, metallic tin and other materials entering into the process or resulting from the process of detinning tin plate scrap.

Recovered scrap steel, usually compressed into bundles, and shipped to steel mills for remelting purposes was said to sell for about 90 per cent of the market value of heavy melting steel scrap. It was said that the prices paid for tin plate scrap vary, but the average is $9.21, shipping point, when consigned to Sewaren, N. J., $5.25 to Neville Island, Pittsburgh, and $5.80 to East Chicago. The higher price paid for tin plate scrap for delivery to Sewaren, N. J., where the Vulcan Detinning Co. has a large plant, was said to be due to keen competition in the seaboard territory for such supplies for shipment to Germany and Italy.

Plants of the Vulcan Detinning Co. are located at Neville Island, Pittsburgh, and Streator, Ill., in addition to the one at Sewaren, N. J. Other companies which use the detinning process are the Metal & Thermit Corporation, New York, and the Continental Can Co., New York. These companies complained to the Interstate Commerce Commission of existing freight rates on tin plate scrap. The report of the examiner was that existing rates are not unreasonable or unlawful.

British Foreign Trade in Iron and Steel Products

(In Gross Tons)

Item	Imports July	Imports August	Exports July	Exports August
Pig iron and ferroalloys	9,121	9,992	42,289	45,078

From cablegram of William L. Cooper, commercial attaché, London, to the United States Department of Commerce.

More British Iron and Less Steel in August

LONDON, ENGLAND, Sept. 12. (*By Cable*).—Production of pig iron in August was 682,000 gross tons and that of steel ingots and castings was 753,300 tons. The August pig iron output was the largest this year. That for steel was the sixth largest, with the peak at 859,900 tons in March.

Comparisons of recent output with other periods is as follows:

	Pig Iron, Gross Tons	Steel Ingots and Castings, Gross Tons
1913—Av. monthly	855,000	638,600
1920—Av. monthly	669,500	755,600
1922—Av. monthly	408,500	490,100
1923—Av. monthly	620,000	706,800
1924—Av. monthly	609,900	685,100
1925—Av. monthly	519,700	616,400
1926—Av. monthly	203,500	296,700
1927—Av. monthly	607,800	758,200
1928—Av. monthly	550,900	710,400
1929—Av. first quar.	558,000	801,400
1929—April	611,300	808,600
1929—May	654,800	840,400
1929—June	657,800	830,900
1929—July	671,900	803,800
1929—August	682,000	753,300

The August output of pig iron compares with a monthly average of 599,600 tons for the first half. The steel production last month compares with 814,000 tons a month for the first half.

Hannibal Green's Son & Co., Inc., Troy, N. Y., agent for the Burden Iron Co., has been acquired by a new company of the same name, of which F. J. Keeler is president and M. H. Fitzpatrick treasurer.

Iron and Steel Markets

Railroad Equipment Demand Develops

Central of Georgia Buys 1000 Cars and Santa Fe Inquires for 5700—Structural Lettings Heavy—Steel Output Down to 85 Per Cent

RAILROAD buying and construction work are auspicious factors in a steel market still characterized by uncertainty.

The expected upswing in railroad equipment demand is materializing and the customary fall rail buying movement is gathering momentum. The Central of Georgia has bought 1000 freight cars and the Norfolk & Western has placed 1000 car bodies. The Santa Fe is inquiring for 5754 cars and the Southern for 2000, while the Chesapeake & Ohio is named as a probable buyer.

An order for 50,000 tons of rails and 12,000 tons of track supplies has been placed by a Western railroad, and two new rail inquiries at Chicago total 100,000 tons. The Pennsylvania and New York Central are expected to come into the market for about 200,000 tons each before the close of the month.

Construction taking steel promises to keep up at the high rate of August. Structural steel lettings for the week totaled 50,000 tons, and pending work was augmented by fresh inquiries for 57,000 tons, including 40,000 tons for the Empire State Building, New York.

Steel demand, although getting support from two important consuming industries, lacks the widespread buoyancy of previous months. The possibility that the unusually active summer months reflected an overreaching of industrial operations is still taken into account.

Of interest in this connection is a downturn in automobile production, following a short-lived recovery. The change in trend is attributable to curtailed output of low-priced cars, which is more than offsetting increases by companies bringing out new models. Ford output in September, according to present estimates, will decline to 170,000 cars, compared with 205,000 in August.

Plans of farm machinery makers to expand output in October, as they swing into production of spring equipment, are tempered by the unfavorable turn of agriculture, following disastrous droughts in wide areas. Lessened farmer buying power is also affecting the demand for wire products.

Steel mill backlogs are still shrinking and steel production has undergone further reduction. Operations in terms of steel ingot output now range from 80 to 90 per cent. The Steel Corporation's average is 85 per cent, which is also a liberal estimate for the industry as a whole.

Further announcements of the opening of fourth quarter books, usually at unchanged quotations, have resulted in little contracting. Since the market is not advancing, consumers have no price incentive either to specify beyond their immediate needs or to obligate themselves ahead. On the contrary, they are watching for signs of price weakness. Mills, in turn, are not pushing sales lest the stability of prices might suffer.

Pending a real test of prices, few significant changes have occurred. Concessions on shapes, bars and plates, although by no means general, are reported more frequently. On the other hand, sellers of galvanized sheets are taking a firmer stand at 3.60c. a lb., an advance of $2 a ton over the recent market.

Chronic instability in wire products is giving way to open recognition of reduced prices. Most mills are now quoting wire nails at $2.55 and plain wire at $2.40, except to small users. On nails as low as $2.45 is being done in some instances.

Leading makers of steel pipe have notified jobbers that failure to maintain resale prices may result in discontinuing sales to the offenders.

The New York Shipbuilding Corporation has placed 18,000 tons of steel for two vessels to be built for the Export Steamship Co.

Tin plate production is undergoing a seasonal recession, now ranging from 75 to 90 per cent.

Scrap is inactive and weak, but pig iron, temporarily at least, is stronger. Southern producers of merchant iron have accumulated substantial backlogs in the past 30 days, booking 125,000 tons in the St. Louis district alone, and their output has been further reduced by the blowing out of another furnace. The lowest price now current in the North on Alabama foundry iron is $13, Birmingham, or 50c. a ton above the low point, and $13.50 is rapidly becoming the minimum.

Pig iron buyers are cautious, well aware that surplus steel company iron may soon be more of a market factor, but purchases are in fair volume, indicating sustained requirements. Sales in New York, totaling 26,000 tons, included 15,000 tons for a radiator plant. Cleveland reported bookings of 24,000 tons. The Ford company has bought 5000 tons of high-silicon malleable from an Ontario furnace and may buy 5000 tons additional.

Fabricated structural steel lettings in August (computed) were 365,750 tons, a new monthly record.

THE IRON AGE composite price for pig iron has advanced from $18.25 to $18.29 a gross ton and is 66c. higher than a year ago. Finished steel remains for the sixth week at 2.398c. a lb., which is $1 a net ton above the figure of 12 months ago.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Steel Mill Operations Lowest in Several Months—New Business Not in Large Volume

PITTSBURGH, Sept. 17.—Steel works operations have eased off slightly in the last week and are probably under 90 per cent of capacity in this district for the first time in several months. This is due largely to gradual curtailment by the larger producers which have reduced their backlogs considerably in the last few weeks. In the meantime, specifications have been far from sufficient to sustain such a high operating rate and heavier fall demand has not developed.

At this time tonnage releases of large steel consuming industries are reaching the mills steadily, but not in large volume, indicating that users of steel are watching the turn of the market very closely with a view to ascertaining future trends. With most mills in a position to make deliveries on steel in about the time required for rolling, it is no longer necessary to place orders in advance as was the case in the spring and early summer when mill facilities were taxed to the utmost. Consequently the present declining tendency in operating schedules is interpreted by some as merely the adjustment of current production to current demand, an adjustment which would have taken place several weeks earlier had it not been for the heavy backlogs accumulated during the height of spring demand.

It is also pointed out that specifications are satisfactory for this season of the year and compare favorably with those of previous similar periods. The impression of dullness is merely accentuated by the abnormally heavy summer demand for steel.

The past week has brought out little which might indicate the trend of fall business. Consumers generally are cautious in placing their fourth quarter contracts and sellers are not anxious to push sales in view of the weakening effect this might have on prices. In the case of sheets it will still be several weeks before shipments against present specifications are fully completed, and makers with comfortable backlogs are not failing to take advantage of their situation by firmer stand on prices, particularly on galvanized material. The extent of buying in the next month will decide whether or not they will be successful.

At present, prices on nearly all products have a rather uneasy tone, but, if concessions are being made, they are being well concealed. Shading is reported occasionally from competitive districts where buyers are making the most of advantages which they have enjoyed to a greater or less extent for some time.

Third quarter prices have generally been reaffirmed, although in the case of some grades of sheets such quotations have been the maximum and represent an advance to some buyers. Makers of nails and wire have recognized recent weakness in announcing fourth quarter prices, although they are still quoting $2.65 a keg for nails and 2.50c. a lb. for wire to small buyers, prices which were recently disappearing on most transactions.

The pig iron market retains its price strength, but fourth quarter buy-

ing is still being delayed by the majority of consumers. Inquiry is improving and two round tonnages of basic are reported to be actively pending in the Valleys.

The tone of the scrap market is still very weak, but mill buying is lacking and lower quotations are not justified either by sales to mills or purchases by dealers.

Pig Iron.—This week has been another of comparative quiet so far as large purchases are concerned, and one important seller estimates that considerably less than half of the iron which will be bought for fourth quarter delivery has been placed thus far. The radiator maker at Uniontown, Pa., has not yet closed in full against its recent inquiry, and other large tonnages are said to be pending. In the Valley district at least two large lots of basic iron are soon to be closed, and merchant furnaces in that district are gradually building up their order books. Stocks of iron are low, and September shipments, while hardly equal to the August rate, are generally thought to be satisfactory. Some buying will be delayed until early in October on account of the uncertainty of the steel industry, but, with pig iron consumers operating with very low stocks, it is practically certain that nearly all of them will have to cover within the next 30 days. The price situation is unchanged and seems to be very steady in the Valley territory. Reports of shading in the immediate Pittsburgh district are heard, but recent sales at the full quoted schedules of the Pittsburgh furnace seem to justify present quotations.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Shipments to non-integrated companies have declined in September, as compared with the previous month, and buying for fourth quarter has not yet developed to any appreciable extent. Consumers apparently feel that there will certainly be no advance over the present $35 quotations on billets, slabs and sheet bars, and are also probably anxious to get a better idea of their requirements over the last three months of the year before making commitments. There is also objection to the quoted prices on billets and slabs, as strict adherence to this quotation would mean an advance of $1 a ton to large buyers. Shipments of wire rods are steady and show little reduction from the rate in August. Fourth quarter contracts are being taken at $42 a ton, Pittsburgh or Cleveland, and there seems to be no question as to the firmness of the price.

Bars, Shapes and Plates.—Mill backlogs on the heavy hot-rolled products are at the lowest point in several months, and, although tonnage releases are still coming in rather steadily, their volume has declined considerably since Labor Day. Pittsburgh mills are now in a position to ship plates in about three weeks, and deliveries on bars and shapes may be had in a shorter time. Considering the fact that plate backlogs averaged about six weeks on Aug. 1, the extent to which mill operations have been maintained on the strength of backlogs in the last month is clearly indicated. Structural business is not particularly active, but the volume of awards is fairly steady and fabricating shops in the district are not badly in need of business. Barge builders are also taking large shipments of plates and shapes, but their backlogs are dwindling and a few recent barge orders have been filled from stock. Mills in this district are interested in the inquiry of the Norfolk & Western for 2000 hopper cars, and it is quite likely that steel for at least half of this order will come from Pittsburgh makers. Prices have not developed definite weakness, although the tone of the market is not so firm as it was a short time ago. Occasional reports of shading the price of bars in the East are reported, although this situation has existed intermittently all summer and does not represent a new market tendency. Prices on structural shapes are also questioned in Eastern territory, although this situation is brought about by the competition of the Eastern producers, and has not yet been felt in the natural territory of Pittsburgh mills.

Rails and Track Accessories.—Following its inquiry for 54,000 tons of rails, the Chesapeake & Ohio is also inquiring for 10,000 tons of tie plates and will probably place this business before the end of the month. The Norfolk & Western recently divided an order for 1500 tons of tie plates between the Bethlehem Steel Co. and the Wheeling Steel Corporation. Otherwise no definite inquiries for rails and track accessories have come out in this district, although it is believed that additional tonnage will come before the trade before the end of the month.

Bolts, Nuts and Rivets.—Makers of bolts and nuts have reaffirmed third quarter prices for the last three months of the year, the general quotation being 70 per cent off list. Prices on rivets are also unchanged, the ruling figure on the large size being $3.10 a 100 lb., while 7/16 in. and smaller are offered at 70 and 10 per cent off list. Makers are still maintaining a comparatively high rate of operation, the general average for the industry being somewhere between 70 and 75 per cent.

Wire Products.—Makers of wire and nails will quote the present range of prices on both products for the fourth quarter. On small tonnages of nails, the $2.65 per keg, Pittsburgh, price will rule, while larger buyers will be given the $2 a ton advantage. On wire, the quotations are 2.40c. and 2.50c. a lb. Business in September is about equal to August on manufacturers' wire, while the jobbing trade seems to be less active than before. These buyers are taking very small tonnages in an effort to keep stocks at a minimum.

Tubular Goods.—The pipe market is rather quiet, although business is generally considered satisfactory, and operations are good. One estimate places lap-weld mills at 80 per cent of capacity, although this figure may be about five points too high. Opera-

40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1¼% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1¼	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

tions of butt-weld mills are not so good, the average for the industry probably holding at about 60 per cent. No further increase is expected in this department before spring. Seamless mills are scheduled as well or better than lap-weld units, although oil country business has developed no marked activity during the entire year. Mechanical and boiler tubing is quiet, but heavier specifying from the automobile industry may improve the situation in the former product within the next 30 days.

Sheets.—Shipments during September are going to compare favorably with those of August, at least from the standpoint of daily rate, but the month will see a sharp reduction in backlogs. Recent specifications have fallen far short of production and consumers are slow in placing their fourth quarter tonnage. This is partially explained by the fact that many large buyers still have material coming to them which was specified several weeks ago, and mills are not anxious to solicit business when deliveries yet to be made on old commitments will occupy them until well into October. However, most makers will now take orders for delivery in three to four weeks on all the common finishes of sheets, while automobile body material may be accommodated more quickly. The leading interest ran its mills last week at better than 95 per cent of capacity and is scheduled for the present week at slightly under 100 per cent. Independent sheet mill operations in Pittsburgh and nearby district average at least 90 per cent. Fourth quarter prices have not been officially announced in this district, although nearly all makers are prepared to take contracts at 2.85c., Pittsburgh, on black sheets, 3.60c. on galvanized, 2.20c. on light plates blue annealed, 2.35c. on blue annealed sheets and 4.10c. on auto body sheets. In the case of galvanized sheets and light plates, this represents an advance of $2 a ton over recent minimums which many makers refused to recognize. Special efforts are being made to hold the price on galvanized material, and no fourth quarter tonnage has been reported placed at less than 3.60c. Concessions of $2 a ton still occur on tin mill black plate, on which the quoted price is 3c., Pittsburgh.

Tin Plate.—The tin plate business is feeling the full effects of the usual dull season at this time of the year, although the leading interest operated its mills last week at 90 per cent of capacity and has scheduled a similar rate for this week. Operations of independents average 75 per cent or less and further curtailment will probably be necessary before improvement develops.

Strip Steel.—Some makers report that the majority of their larger customers have placed their fourth quarter tonnages at the full quoted prices on both hot and cold-rolled strip, although many consumers serving the automobile industry are slow in estimating their requirements. Makers of parts and accessories for the General Motors subsidiaries have been given a close approximation of their requirements over the last three months of the year and the tonnages needed are somewhat larger than expectations in some cases. Strip mills in the district are running at 70 to 75 per cent of rated capacity, a rate which is just about supported by current specifications. On hot-rolled strip, fourth quarter quotations are unchanged at 2c., Pittsburgh, for 6-in. and narrower, and 1.90c. for the wider sizes. Cold-rolled is holding at 2.75c. to 2.85c., Pittsburgh or Cleveland.

Coal and Coke.—The coke market is developing a firmer tone, although the furnace grade is still quotable at $2.65 to $2.75 a ton, Connellsville. Merchant interests have disposed of most of their surplus tonnage at prices within this range or lower, and are now preparing to ask higher figures on fourth quarter contract business. One large furnace interest which is asking for prices on its requirements over the remainder of the year will probably have to pay at least $2.75. The market on foundry coke is still dull, but prices are gaining strength and less material is being offered at sacrifices. As cold weather approaches domestic fuel is more active and quotations are higher. The coal market has a stronger undertone, but prices have not improved appreciably.

Old Material.—Weakness in the scrap market has continued over the past week, but a few dealers believe that a stronger tendency has made itself felt in the last two days. In other words, efforts are being made to stabilize the market, and no dealer would be willing to sell heavy melting steel at less than $18, even though there were buyers. Small sales at $18.25 and $18.50 have been reported during the last week, and occasional distress tonnages have gone at lower figures. Mills show no disposition to buy steel scrap, and hold-ups at one or two important consuming points are largely responsible for the weakness of the market. Other grades of scrap are about the same, although machine shop turnings are now quotable at $11.50 to $12. Sentiment in the scrap market has not improved, but weakness is based on technical conditions and not on actual sales. In view of this, lower quoted prices are hardly justified and may not come out when mill buying does begin.

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.00 to $18.50
No. 2 heavy melting steel	16.00 to 16.50
Scrap rails	17.50 to 18.00
Compressed sheet steel	18.00 to 18.50
Bundled sheets, sides and ends	16.50 to 17.00
Cast iron carwheels	16.50 to 17.00
Sheet bar crops, ordinary	19.50 to 20.00
Heavy breakable cast	12.50 to 13.00
No. 2 railroad wrought	18.00 to 18.50
Hvy. steel axle turnings	16.50 to 17.00
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.50 to 22.00
Railr. coil and leaf springs	21.50 to 22.00
Rolled steel wheels	21.50 to 22.00
Low phos. billet and bloom ends	22.00 to 22.50
Low phos., mill plates	22.00 to 22.50
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.50 to 17.00
Electric Furnace Grades:	
Low phos., punchings	20.00 to 21.00
Hvy. steel axle turnings	16.50 to 17.00
Blast Furnace Grades:	
Short shoveling steel turnings	12.50 to 13.00
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Cement coated nails, per keg	3.05

More money was spent in Canada in 1928 on agricultural implements and machinery than in 1927, according to the Dominion Bureau of Statistics, Ottawa. This increase was largely supplied by imported goods, as Canadian production dropped in 1928 to $41,199,841, from $42,996,288, the high record in 1927. Exports, including re-exports, declined to $14,560,412 from $16,559,806, while imports advanced to $39,893,490, from $26,101,338. Deducting exports from the sum of production and imports shows apparent consumption of $66,532,919 in 1928, compared with $52,537,820 in 1927.

The Army Ordnance Association expects an attendance of approximately 10,000 at its eleventh annual meeting to be held on Oct. 10 at Aberdeen, Md., proving ground. Extensive munition and aviation demonstrations have been arranged and among organizations participating will be the National Metal Trades Association and the National Aeronautic Association. Dinner will be followed by the presentation of technical papers and addresses by prominent guests.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

Chicago

Steel Production Down to 88 Per Cent—Freight Car and Rail Inquiries Lead in Prospective Business

CHICAGO, Sept. 17.—Interest in this market continues to center in rapid moves being made by the railroads. The Santa Fe is making known that it will buy 5754 freight cars and the Southern will purchase 2000 cars. The superstructures for these cars will take close to 115,000 tons of steel. No less impressive is the standard-section rail market, which this week has brought 50,000 tons additional to Western makers' books, and fresh inquiry for 100,000 tons.

Concurrent with this brighter side of the steel trade comes the announcement of the banking of No. 3 furnace at South Chicago Works. The leading producer now is using 17 of 27 stacks, a loss of three in two weeks, and ingot output for the district as a whole is not above 88 per cent of capacity.

New buying in finished steel is dragging, not so much because of absence of interest on the part of buyers but because of lack of accord among producers as to the proper time for announcing fourth quarter prices. The Inland Steel Co. has taken the lead and has named 2.05c. a lb. for plates, shapes and bars.

Forward contracting in wire is making progress at current prices, but quotations for wire nails are weak and new business is dull. Attempts to bolster sheet prices are not meeting with full success, especially when delivery points are to the south and west of Chicago.

The suspension of a large pipe contract is still in effect. Deliveries on most sizes of plates range from three to four weeks, or better if orders match rolling schedules.

There is no evidence here that semi-finished steel is being accumulated at mills, which at the moment are closely balancing output with shipments.

Ferroalloys. — Several carloads of ferromanganese have been sold at $105 a ton, seaboard. The spiegeleisen market is quiet except from the viewpoint of shipments, which are being maintained at a uniform rate.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Pig Iron. — Prices for Northern foundry iron are firm at $20 a ton, local furnace, as buying mounts to sizable tonnages for delivery in the fourth quarter. All merchant furnaces but one, Iroquois No. 5, are lighted, and its operators plan to put this one in service about the first of next month. Reports received here are to the effect that several light car manufacturers are curtailing output. On the other hand, one builder, just now swinging into production on new models, is ordering much larger quantities of pig iron. Southern iron is quotable at $13 to $13.50 a ton, Birmingham. Efforts are being made to establish the market at the upper figure, but outstanding quotations at $13 are delaying this move. The silvery market is drifting slowly in the matter of sales, but shipping orders are fully equal to the average in recent weeks. Shipments of Northern iron are running 10 per cent heavier than in the corresponding period of last year.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$18.51 to 19.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Sheets.—New business is moderately active, and Western makers' backlogs are growing slowly. Irregularities are still noted in prices, though one local producer is attempting to hold rigidly to 3.05c. a lb., Chicago, for black sheets, 3.75c. for the galvanized product, and 2.35c. for No. 10 gage blue annealed sheets. Lower prices than these prevail on tonnages bought for shipment south of Chicago. Deliveries of heavy gages of blue annealed sheets are extended beyond 12 weeks, and much business in this grade is being diverted to other producing centers. Galvanized sheets may be had in four to five weeks, and the tendency of deliveries is to be still further deferred. Several large inquiries are now before the trade from jobbers. Output has reached 95 per cept of capacity following a free supply of sheet bars.

Base Prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Rails and Track Supplies.—A Western railroad has ordered 50,000 tons of standard-section rails with which there will be required close to 12,000 tons of track supplies. This order is for rolling this fall and the sellers expect that releases will be forthcoming in two to three weeks. In the meantime, Chicago rail mills continue to operate at unchanged schedules on past orders. No word has been received here as to the disposition of the rails for the Chesapeake & Ohio. Fresh inquiry before Chicago mills by two Western railroads totals 100,000 tons. Shipping schedules now being arranged against new orders show that the railroads are willing to take fall deliveries at a faster rate than has been their custom in recent years. Local track accessory departments are engaged at 75 per cent of capacity. Miscellaneous orders for light rails aggregate only a few hundred tons.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—This cast iron pipe market continues to mark time, with few indications that an improvement can be expected at an early date. Milwaukee will open bids Sept. 24 on 200 tons of 8-in. and 300 tons of 12-in. pipe. Several inquiries are taking shape, each of about 200 tons, and several contractors give promise of having pipe to buy before the end of the month. A few odd tonnages are being sought by railroads and industrial plants. Deliveries are prompt on most sizes, and prices are stable at $45.20 to $46.20 a ton, delivered, Chicago, for diameters 6 in. and larger.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Reinforcing Bars. — Awards total more than 1000 tons, about equal to the lettings of the preceding week. The character of recent buying is well diversified, representing new industrial activity, a large apartment building and business structures. Litigation now threatens to hold in check Illinois road work, which was to have been financed by the new gasoline tax. Fresh inquiry is in moderate volume, the bulk of it, however, for small projects. Prices remain in the unstable condition of recent months. Some sellers of rail steel reinforcing bars are making another attempt to establish 1.95c. a lb., Chicago Heights, as the minimum. Mill deliveries are improved.

Wire Products.—New contracting in these products is in fair volume, especially from jobbing and retail buyers. Stocks at mills are in good condition for the fall trade, and wire mill output has been cut to 60 per cent of capacity, which conforms with current shipments. The price situation is unaltered from that of a week ago, with quotations steady on wire but weak on nails. Wire nails are commonly quoted at $2.50 to $2.60, base, per 100-lb. keg, delivered Chicago. Demand for woven wire fencing is slowly expanding.

Cold-Rolled Strips. — Specifications are shrinking in volume as several manufacturers of low-priced motor cars continue to whittle down production programs. Output for the country as a whole averages close to 50 per cent of capacity.

Plates.—New orders for oil storage tanks call for 8000 tons of steel plates, 6500 tons of which will be supplied by makers east of Chicago. The 1500 tons purchased from local mills will be sent to Oklahoma, where it will be fabricated. These orders were placed by five oil refiners, and the bulk of the tonnage is for erection in Texas. Fresh inquiry comes in one lot from

the Southwest and is for 4000 tons, which added to old inquiry makes a total of about 14,000 tons of tankage plates that is now before the trade. Also of interest this week is an inquiry for 4000 tons of steel by a Lake Michigan shipbuilder. Part suspension in the output of welded steel pipe is still in effect. The contract covering a large new project is still valid and it is generally thought here that output as originally planned will be resumed at an early date. The outlook in the railroad equipment market seems to be improved since a week ago. Plans are rapidly taking shape to put into shops 1000 cars recently ordered by the St. Paul. Releases for steel are expected in about three weeks. These cars are of unusually heavy construction and each superstructure will take 16 tons of steel. The Chicago & Eastern Illinois is still undecided whether it will build in its own shops or will award a contract for 500 gondola bodies. The Southern is in the market for 1000 box cars and 1000 gondolas. Information gathered by sellers of steel indicates that Western railroads will seek prices in the next week on 5000 cars. New buying in plates is quiet in the absence of general accord among producers as to the proper time for the announcement of fourth quarter prices. The Inland Steel Co. is today reaffirming the present quotations, but no announcement has come from the leading producer.

Structural Material. — Structural awards for the week totaled more than 10,000 tons, of which 5000 tons is for 1929 and 1930 bridge construction work for the Great Northern. A garage in Chicago calls for 2500 tons, and highway bridge work in Oklahoma accounts for 2000 tons. Fresh inquiries total close to 5000 tons. Plans will soon be ready for a 1600-ton office building in Milwaukee. A packing plant in St. Louis will take 900 tons, and highway bridges in Lake County, Ind., will require a like tonnage. A theater at Fort Wayne, Ind., swells the list by 700 tons. New bids are being submitted on the 4800 tons needed for the Phillips School, Chicago. It is reported that bids will be opened Sept. 24. Lettings during the week have been decidedly in favor of large fabricators. Although there is a fair amount of light tonnage work before small shops, it is not coming out rapidly enough to check the shrinkage of order books. The Inland Steel Co. has named 2.05c. a lb., Chicago, as its fourth quarter contract price.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Bars. — Current specifications for mild steel bars reflect steady consumption. Activity among manufacturers of road machinery is spotty, with several plants at Milwaukee having made recent sharp reductions in output. Farm implement makers have hit an even stride except in production of heavy tractors and combines. Improvement, however, is said to be in sight as farm machinery manufacturers lay plans for heavier consumption of steel during the fall months for the production of equipment that will be needed for spring delivery. Further improvement is noted in demand from automobile parts makers. The change, however, is slight. Announcements as to fourth quarter prices are slow in being made. The Inland Steel Co. alone is making known to its trade that mild steel bars for delivery in the next three months will be priced at 2.05c. a lb., Chicago. Contracting for alloy steel bars is progressing satisfactorily, and backlogs are growing. Specifications are expanding, and deliveries are tending to go beyond the two weeks' point. The iron bar market is quiet, except for scattered spot sales of small individual tonnages. Specifications for rail steel bars are measurably larger from the bed manufacturing trade and makers of barn equipment. A fair part of fourth quarter contracts is under cover, and prices are well established at 1.95c. a lb., Chicago Heights. Specifications are larger than shipments, and hours of rolling have been extended.

Bolts, Nuts and Rivets.—Forward contracting is making rapid strides. Prices are well established. Current specifications continue to run only in fair volume, but indications are at hand that shipments will grow in October.

Coke. — Shipments of by-product foundry coke are well sustained at the rate of the opening week in September. Spot sales at $8 a ton, local ovens, are few in number and widely scattered.

Old Material.—The Chicago scrap market is dull. Heavy melting steel is nominally quoted at $15 to $15.50 a gross ton, delivered. Although some users are taking this grade in excess of immediate needs, this being an effort to expand reserves on hand. Supplies are more than ample as gaged by mill operations at 88 per cent of capacity. Brokers are covering orders at 25c. lower than a week ago. Demand for hydraulic bundles is unusually quiet, and one broker, who is usually very active in this grade, is without a large order for the first time in many months. Rerolling rails are in light demand, and prices have dropped 25c. a ton. Among lists offered this week are 4000 tons by the Rock Island, 2000 tons by the Grand Trunk, a small extra list by the St. Paul and lists from various plants of the General Motors Corporation.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$15.00 to $15.50
Shoveling steel	15.00 to 15.50
Frogs, switches and guards, cut apart, and misc. rails	16.75 to 17.25
Hydraul. compressed sheets	13.50 to 14.00
Drop forge flashings	10.75 to 11.25
No. 1 busheling	13.25 to 13.75
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	17.00 to 17.50
Low phos. plates, 12 in. and under	17.00 to 17.50
Blast Furnace Grades:	
Axle turnings	13.00 to 13.50
Cast iron borings	10.50 to 11.00
Short shoveling turnings	10.50 to 11.00
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.75 to 18.25
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	20.00 to 20.50
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
*Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.50 to 27.00
Steel car axles	17.50 to 18.00
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.10c. to 2.35c.
Reinforc'g bars, rail steel	1.85c. to 1.95c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons	3.60c.

Com. wire nails, base per keg	3.20
Cement c't'd nails, base per keg	3.20

Pheoll Mfg. Co. of Minnesota, a subsidiary of the Pheoll Mfg. Co., Chicago, will take over and operate as a direct warehouse and sales office the bolt, nut and screw business formerly conducted by the Irvine Brass & Copper Co., Minneapolis. This office and warehouse will be situated in the Winston-Harper-Fisher Building, 405 Second Avenue North.

Improvements to be made at the Rankin Works of the American Steel & Wire Co., Rankin, Pa., include the installation of eight 300-hp. 167-r.p.m. motors and two 1000-kva. transformers. An order for this equipment, together with an outdoor substation, has been placed with the General Electric Co.

New York

Pig Iron Sales 26,000 Tons—Building Will Take 40,000 Tons of Structural Steel

NEW YORK, Sept. 17.—Pig iron sales last week were heavy, totaling 26,000 tons. The largest individual purchase was 15,000 tons, representing the fourth quarter requirements of the Bayonne, N. J., radiator plant. The Richmond Radiator Co. has partly closed against its inquiry for 5000 tons for Uniontown, Pa., but has postponed action on most of the tonnage. A large part of current business is made of relatively small lots placed quietly. Most melters are conservative in buying, but are covering, or have covered, for part of their fourth quarter needs. Foundry operations are reported as increasingly spotty in nearby New England, but are well sustained on the average, although the outlook for the remainder of the year is somewhat uncertain. Some makers of heating equipment are experiencing a seasonal pickup in activity, but most of them still have large inventories to work off. Judging by business booked thus far in the current week, with one seller reporting orders for 1500 tons and another for 1000 tons, pig iron demand is keeping up at a fair rate. Developments in prices are in the direction of greater stability. Alabama furnaces are now quoting $13.50, base, Birmingham, on foundry iron, and the lowest price reported in the past week was $13. Buffalo furnaces are less aggressive and are more generally holding at $18, base, although quotations of $17.50, furnace, have not disappeared. Eastern Pennsylvania producers have been most active in soliciting recent business in northern New Jersey and have quoted $18.50, base, furnace, on attractive tonnages. The Port Henry, N. Y., furnace is still out for repairs and the Mystic furnace at Everett, Mass., may also be put out for relining.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Buying is limited to small lots. Demand for structural steel has not yet developed to the usual fall proportions. Black, galvanized and blue annealed sheets are quiet and prices are still subject to concessions of $1 to $2 on black and galvanized and $2 and more on blue annealed.

Cast Iron Pipe.—Inquiries for pressure pipe are almost entirely for carload lots or less, and quotations are unchanged, with Northern foundries quoting $31 to $33, base, f.o.b. plant, and Southern makers quoting $35 to $37 a ton, f.o.b. Birmingham. About 180 tons of 12-in. and 24-in. pipe for Hartford, Conn., was awarded to a Southern maker. A steam company making an installation at the Chevrolet Motor Co. assembly plant in Tarrytown, N. Y., has bought about 200 tons of pipe from the National Cast Iron Pipe Co.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—Three hundred tons of bars for highway bridges in New Jersey will be supplied by Igoe Brothers. Considerable tonnage for subway work is pending, but no awards will be made until the last week of September or possibly early in October. The volume of small jobs has fallen off somewhat, but mills are reported to be well engaged. Prices are steady and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—A definite trend in steel business is still lacking in the New York territory. Orders received by some companies so far this month are about equal to those booked during the same number of days in August, but, as last month was comparatively light in new buying, steel business is barely holding its own, considering the continued high rate of operations. The leading Eastern producer, which started out the month at a 95 per cent operation, has dropped to around 90 per cent. Output of other Eastern companies has also tapered somewhat, though in some cases production is still running ahead of the volume of incoming business. The week's most significant development is a revival in buying of railroad equipment, with somewhat more promising prospects in the form of inquiries. The Central of Georgia has ordered 1000 cars, but these will be built in the Birmingham district. The Norfolk & Western has contracted with a Virginia company for 1000 steel car bodies. The most important inquiry in the East comes from the Southern Railway, which asks for bids on 2000 cars, but is expected to buy more than that number. In structural steel, the outlook is still good. An outstanding project is the building to be erected on the site of the old Waldorf-Astoria Hotel, Fifth Avenue and Thirty-fourth Street, New York, which will require 40,000 tons of steel. The City of New York has announced preliminary plans for about 100 miles of new subway construction in New York, but it will be some time before the work has got to a point that steel will be called for. In the price situation, the stand that some makers of galvanized sheets have taken for a firm 3.60c., Pittsburgh price, is the principal development. The $2 differential to the jobber is wiped out in many cases. No marked price weakness has appeared other than that in structural steel brought about by keen competition between Eastern and Middle district producers.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Warehouse Prices, f.o.b. New York

Pipe.—At least three of the leading producers of steel pipe have notified jobbers in New York, as well as in the remainder of the country, that failure to maintain resale prices hereafter may result in the cutting off of sales to such offenders. Other pipe makers will send similar notices to their customers within a few days. Such action follows in tenor that taken several months ago by the two leading makers of wrought iron pipe, the A. M. Byers Co. and the Reading Iron Co. While the announcement by the steel pipe producers applies to the entire country, it is the situation in New York particularly which has brought it about. It is stated that the failure of some pipe jobbers, including a number who receive consigned stocks, to maintain any semblance of price stability has unsettled the entire market to such an extent that none can obtain profitable prices. The action of the mills is said to have been urged by some of the jobbers whose business success is threatened by inability to obtain a profit on the pipe they sell.

Coke.—All grades are quiet. Furnace coke is unchanged at $2.75 to $2.80 a net ton, Connellsville. Special brands of beehive foundry coke are quoted at $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material. — Supplies of all grades of scrap are plentiful and, with eastern Pennsylvania consumers in some instances asking delays in deliveries on contracts, brokers are able to buy No. 1 heavy melting steel at $16 a ton, delivered, and No. 2 steel at $13.50 to $14.25 a ton, delivered. Sizable tonnages of No. 2 heavy melting steel are still moving to the consumer at Bethlehem, Pa. Cast scrap is inactive and prices depressed.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.50 to $13.25
Heavy melting steel (yard)	8.00 to 10.00
No. 1 hvy. breakable cast.	10.25 to 11.50
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.75 to 8.00
Short shoveling turnings..	8.00 to 8.50
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles.....	19.50 to 20.00
Iron car axles.....	23.00 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.25 to 13.75
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	14.50
No. 2 cast (radiators, cast boilers, etc.)	14.00

U. S. Metal Products Co., sheet metal jobber, specializing in mill surpluses and seconds, has moved to a new warehouse at 2300 West Fifty-eighth Street, Chicago, where 40,000 sq. ft. of floor space will be utilized for steel storage.

Cleveland

Orders for Finished Steel Decline—Mills Need Business in Some Lines—Automotive Demand Unimproved

CLEVELAND, Sept. 17.—The demand for finished steel declined the past week and backlogs were further reduced. The slackening is due to the restricted demand from the automotive industry. The trend of production in that industry still appears to be downward, the increase in schedules by some motor car manufacturers on new models being more than offset by curtailment by others. It is reported that the Ford Motor Co. has reduced its production schedules considerably and that its September output will be much below its August peak of 205,000 cars. Some of the motor car builders that brought out new models are getting under production slower than had been expected, evidently waiting until their stocks of old cars have been cleaned up or until they can make some gage of the extent of fall buying.

With additional announcements of reestablishment of third quarter prices made during the week, practically all current prices have been named for the last quarter. Alloy steel bars will remain at the present 2.65c. base. Wire nails have been reestablished at the current prices which represent a decline from those ruling at the start of the present quarter. Wire rods have been reaffirmed at $42, Cleveland and Pittsburgh, at which a few contracts have been closed. Some mills are quoting cold-rolled strip at 2.75c. to the larger buyers for the last quarter, which indicates that attempts to get the price back to 2.85c. will not succeed except possibly on small-lot business. Practically no interest in last quarter contracts is being shown by consumers and few mills are soliciting contracts. The automotive industry is following a hand-to-mouth policy in buying for current needs. Products for which some of the mills now are in need of orders include steel bars, hot and cold-rolled strip and sheets.

Semi-Finished Steel.—A local mill is naming for the fourth quarter its present price of $35, Cleveland, Youngstown and Pittsburgh, for sheet bars, billets and slabs and expects to close some of its trade this week at the reaffirmed prices. Specifications are holding up well, and this mill is operating 13 of its 14 open-hearth furnaces. Wire rods have been reestablished for the fourth quarter at $42, Cleveland and Pittsburgh, and some business has been taken for that delivery.

Pig Iron.—Buying for the fourth quarter continues at a moderate rate. Sales totaling 23,600 tons in foundry and malleable iron were made by Cleveland interests during the week, or slightly more than during the previous week. Shipments during the first half of September show a slight gain over the corresponding period of August. The automotive industry is taking a little more iron than last month. Consumers as yet are showing no interest in first quarter contracts, although some furnaces probably would be willing to sell for that delivery at current prices. The market is firm and producers see no possibility of lower prices unless steel plant operations should slow down to an extent that steel plants will have surplus iron for sale. One local producer is still out of the market because of the heavy demands of its steel plant. Prices are unchanged at $18.50, Cleveland, for outside shipment, and $19, furnace, for local delivery. In Michigan, the market is firm at $20 for both foundry and malleable grades. Southern foundry iron is holding in this territory at the recent advance in prices. A few small lots were sold during the week at $14, Birmingham.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$19.50 to 20.00
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Bars, Plates and Shapes.—Demand for steel bars is rather slow, owing to curtailment of the automotive industry, and some of the mills now need orders. Plates are moving fairly well in small lots. Structural inquiry is fair. Inquiries are out for an Akron, Ohio, department store requiring 3000 tons and for grade crossing work in Cleveland that will take 1000 tons. Although present quoted prices have been named for the last quarter, few contracts have been written. Steel bars are quoted at 1.90c. to 1.95c., Cleveland, outside mills holding to the higher price. Plates and structural shapes are quoted at 1.95c., Pittsburgh.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes.....	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars.....	2.25c. to 2.50c.
Cold-fin. rounds and hex.....	3.65c.
Cold-fin. flats and sq.....	4.15c.
Hoops and bands, No. 12 to ¼ in., inclusive	3.25c.
Hoops and bands, No. 13 and lighter	3.65c.
Cold-finished strip.....	*5.95c.
Black sheets (No. 24).....	3.70c. to 3.90c.
Galvanized sheets (No. 24).	4.60c. to 4.75c.
Blue ann'l'd sheets (No. 10).....	3.25c.
No. 9 ann'l'd wire, per 100 lb.....	$2.90
No. 9 gal. wire, per 100 lb.....	3.35
Com. wire nails, base per keg.....	2.90

*Net base, including boxing and cutting to length.

Sheets.—Practically all producers have reaffirmed present prices for the fourth quarter, but few consumers are showing interest in contracts. Specifications showed a further tapering tendency the past week and most mills need tonnage on some grades, although two or three are still well booked for five or six weeks. The expected pickup in the demand for the automotive industry has not yet developed. Prices appear to be well maintained at 2.85c., Pittsburgh, for black, 2.35c. for blue annealed, 2.20c. for light blue annealed plates and 3.60c. for galvanized, although there are occasional reports of a shading of the latter. Wire products' manufacturers will continue present prices through the fourth quarter, but do not expect to close many contracts in the near future because consumers still have considerable wire tonnage due on present contracts and also because of the existing price irregularity on nails. Wire is firm at 2.40c. to 2.50c., Cleveland, and a few contracts for manufacturers' wire have been closed at the higher figure. The rather common range on wire nails is $2.45 to $2.55 a keg, Cleveland.

Old Material. — The market is weaker. The supply has become more plentiful and the demand is light. Some dealers having outstanding mill contracts have temporarily withdrawn from the market with the expectation that prices will go lower. Shoveling steel turnings have declined 50c. a ton and blast furnace scrap 25c. a ton, $10.50 now being the maximum price for the latter and at which some sales are reported. Hydraulic bundles brought $17.75 late in the week for a 1000-ton lot in a transaction between dealers for Youngstown delivery, but probably not above $17.50 would now be paid.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.25 to $15.50
No. 2 heavy melting steel	14.75 to 15.00
Compressed sheet steel	15.50 to 16.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.75 to 10.25
Short shoveling turnings	11.25 to 11.75
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.25 to 10.50
Mixed borings and short turnings	10.25 to 10.50
No. 2 busheling	10.25 to 10.50
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.00
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Strip Steel.—The demand is rather light, particularly for cold-rolled strip, but probably was as good the past week as during several previous weeks. However, most mills have nearly wiped out their backlogs, and there has been considerable curtailment in operation of cold mills. The automotive industry is ordering strip only for early needs. Some pressure is being exerted against hot-rolled strip prices, but there is no evidence of a weakening. Little interest is being taken in fourth quarter contracts, and as yet there has been no real test of the attempt of mills to get 2.85c., Cleveland, for cold-rolled strip from large consumers.

Coke.—Demand for by-product coke for domestic use has fallen off since the recent 25c. a ton price advance, previous to which dealers had bought fairly heavily. Foundry coke is not active, but is firm at $4.85, ovens, for the better grades of Connellsville fuel. Ohio by-product coke is unchanged at $8.25, ovens.

Philadelphia

Mill Output Lower But Still Exceeds New Orders—Shipyard Buys 18,000 Tons of Steel

PHILADELPHIA, Sept. 17.—Steel mill operations show a further recession, output at present ranging from 75 to 90 per cent of capacity. Deliveries are less extended, and ordinary specifications for plates, shapes, bars or sheets are shipped in one to two weeks. Plate mills continue better occupied than other mills, but even plate producers are shipping slightly in excess of new business, although some improvement in buying in the past week is reported. Railroad demand is fair, and some large rail inquiries for next year are expected soon from the Pennsylvania and the New York Central. The Pennsylvania is inquiring for 8000 kegs of spikes. Plate and shape tonnage for new ships continues to be placed, the latest contract covering upward of 18,000 tons for two ships for the Export Steamship Co., being built by the New York Shipbuilding Co., Camden, N. J.

Pig Iron.—Competition of Southern pig iron has lessened, as most Birmingham sellers are endeavoring to maintain a minimum of $14 a ton, f.o.b. furnace. About 2000 tons of floor iron for the Baldwin Locomotive Works is expected to be placed with an Alabama producer or an eastern Pennsylvania steel company furnace. Eastern Pennsylvania sellers are maintaining $21 a ton, furnace, on most current business, but buyers claim that slight concessions are obtainable when Southern pig iron is a competitor. The American Engineering Co. has not yet closed on 1000 tons of foundry iron, but bought a carload of Bessemer last week. Basic iron is quiet and purchases by consumers in this district covering their requirements to the end of the year are not expected until early next month. Low phosphorus iron prices are firm, but business is small.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Mill operations have been steadily curtailed in an effort to balance output with the volume of new business being booked, but, although production is now 75 to 80 per cent of capacity, it is still slightly in excess of new orders. The price is unchanged at 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia.

Reinforcing Bars.—Competition between sellers of billet steel and rail steel bars is still a factor in maintaining prices at a low level, quotations ranging from 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, on billet steel bars, with the extra of $5 for cutting to length usually omitted. Rail steel bar sellers quote 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., Philadelphia, with no extra for cutting to length, but to obtain orders concessions are generally necessary to provide the buyer with a saving from the billet steel price. Recent awards of reinforcing bars have included 100 tons for a school at Chew and Upsal Streets, Philadelphia, to the Truscon Steel Co., and 280 tons for a laboratory for the Gulf Refining Co. to the Roslyn-Gilmore Steel Co.

Shapes.—Mills have a fair backlog of business on their books, but current buying is light. Fabricators are bidding on a substantial tonnage of new construction, however, and increased buying is expected. Prices are unchanged at 1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c. delivered Philadelphia.

Plates.—Fabricators of tanks and railroad cars have provided a substantial part of the tonnage on mill books at present, and shipbuilding promises to contribute some heavy contracts before the end of the year. In the past week the New York Ship Building Corporation, Camden, N. J., has placed about 15,000 tons of plates and 3000 tons of shapes for two ships. Operating rates of mills are slightly reduced, but still are from 80 to 90 per cent of capacity. The quotation is unchanged at 2.05c.,

Coatesville, Pa., or 2.15c., delivered Philadelphia.

Old Material.—With the exception of recent purchases totaling about 40,000 tons of No. 1 heavy melting steel by the leading eastern Pennsylvania consumer in the past two weeks, the market has been unusually quiet. No. 2 heavy melting steel is being shipped to Harrisburg, Phoenixville, Conshohocken and Bethlehem, Pa., but consumers of No. 1 steel at Coatesville, Pa., and Claymont, Del., have sizable stocks on their yards. Heavy breakable cast continues quiet, and consumers are not inclined to pay more than $14.50 a ton, delivered, although some brokers are paying up to $14.50 a ton to fill old orders.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	$16.50
Scrap T rails	16.00
No. 2 heavy melting steel.	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old.	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	14.50 to 15.00
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Sheets.—Automobile body builders in this district are operating better than for some weeks, but not much change is apparent in radio production, which is off slightly with the exception of one plant. Blue annealed sheets, No. 13 gage, are quoted at 2.25c. to 2.35c., Pittsburgh, or 2.57c. to 2.67c., delivered Philadelphia, and light plates, blue annealed, are 2.10c. to 2.20c., Pittsburgh, or 2.42c. to 2.52c., delivered Philadelphia, the lower quotation usually applying when competition is encountered from continuous sheets. A recent purchase of upward of 800 tons of blue annealed sheets by a railroad was on a basis of 2.20c., f.o.b. mill for No. 10 gage. Black sheet prices are fairly stable at 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia, but galvanized sheet prices range from 3.50c. to 3.60c., Pittsburgh, or 3.82c. to 3.92c., delivered Philadelphia.

Imports.—In the week ended Sept. 14, 1020 tons of pig iron arrived at this port, of which 600 tons was from the United Kingdom and 420 tons from Norway. Iron ore imports consisted of 5370 tons from Algeria and 492 tons from Spain. Steel arrivals were 138 tons of steel bars from Germany, 4 tons of structural shapes from the United Kingdom, 5 tons of iron bars from Sweden and 15 tons of steel scrap from the United Kingdom. A shipment of 25 tons of ferrochrome was received from Switzerland.

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel planished	4.30c.
Reinforc. steel bars, sq. twisted and deform. 2.60c. to	2.80c.
Cold-fin. steel, rounds and hex.	3.60c.
Cold-fin. steel, sq. and flats	4.10c.
Steel hoops	3.55c.
Steel bands, No. 12 to ⅜-in. inclus.	3.30c.
Spring steel	5.00c.
*Black sheets (No. 24)	4.10c.
†Galvanized sheets (No. 24)	4.85c.
Light plates, blue annealed (No. 10)	3.25c.
Blue ann'l'd sheets (No. 13)	3.40c.
Diam. pat. floor plates—	
¼-in.	5.30c.
⅜-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more: 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more: 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Labor Turnover Now On a Monthly Basis

About a month ago the United States Bureau of Labor Statistics took over from the Metropolitan Life Insurance Co., New York, the task of collecting and publishing each month rates of labor turnover. The figures are being put out now on the monthly basis, in addition to the equivalent annual basis which heretofore has prevailed.

Expressed as a percentage of the number of employees on the payroll, the net turnover rate in July is given as 3.8, which is the lowest since last February. It compares with 4.2 in June and with a maximum in the past 20 months of 4.6 in April. The latest figure, however, is higher than any of 1928 with the exception of September, comparing with 3.2 in July and with an average of 3.1 through the whole year.

The accession rate is given as 5.2 in July, the highest since April and comparing with 5.0 in June and with 4.0 in July, 1928. Except for April no month of the last 20 shows a higher accession rate than that for July.

Turnover rate is defined by the bureau as the rate necessary to keep the plant going, on the volume of business it has at any moment. A growing plant, or one in which the business is growing at any moment, has an accession rate higher than the separation rate. A plant in which business is declining has a separation rate greater than the accession rate. Consequently, the net turnover rate with the force increasing is the same as the separation rate; with a declining force it is the same as the accession rate.

For the past 20 months, over which the current figures are shown, the accession rates have been consistently month by month higher than the separation rates, indicating that there has been a steady increment in employment. These figures are from more than 300 factories with more than 600,000 employees.

High Record in Fabricated Steel Orders

WASHINGTON, Sept. 17.—Fabricated structural steel orders in August totaled 289,326 net tons, according to reports received by the Department of Commerce from 195 firms with a capacity of 306,005 tons, bookings representing 90 per cent of their capacity. Computed bookings were 365,750 tons, while computed shipments were 338,800 tons, or 88 per cent of capacity.

August orders reported were the highest since March of the present year, when producers reported bookings of 296,343 tons. Computed tonnages booked and shipped in August were both the highest on record, but the fact that only 195 concerns reported left a large capacity for computing bookings and shipments of firms from which no reports were received.

July bookings of 288,801 tons were reported by 223 firms and represented 91 per cent of their capacity of 316,095 tons. Computed bookings for July were 350,350 tons and computed shipments were 304,150 tons, or 79 per cent of capacity. The greatest number of reporting firms for the current year was in February, with a total of 236, or 41 more than the number reporting for August.

Next to August the highest computed bookings total was 358,050 tons for March, while the next highest computed shipments were in May, with a total of 311,850 tons.

Computed bookings for the first eight months of the current year totaled 2,637,258 tons, against 2,221,450 tons for the corresponding period of last year, while computed shipments were 2,344,658 tons, compared with 1,978,900 tons.

Automobile stocks continue to be a major problem with manufacturers, says *Automotive Industries*. Dealer passenger stocks showed a sharp increase from August, 1928, to August, 1929. In the face of this and considering the fact that low-priced automobile manufacturers, notably Ford and Chevrolet, have indicated continued heavy production, sharp curtailment can be expected in the industry, unless the estimate of 5,500,000 units for the year is exceeded. Thus far September production has held up, according to factory executives. The totals are slightly higher than those for the first two weeks of last month, it is reported from Detroit. Therefore, any recession of production would become effective soon unless it were to take the form of a complete shut-down in several factories.

Pacific Coast

Heavy Plate Bookings Include 10,000 Tons for Everett, Wash., Pipe Line—Price Situation Steady

SAN FRANCISCO, Sept. 14.—(*By Air Mail.*)—Some improvement was noticeable in the demand for iron and steel products on the Pacific Coast during the past week, the plate and structural shape markets having been the most active. Plate bookings, at more than 12,000 tons, were the heaviest of any week so far this year and included 10,000 tons which the Steel Tank & Pipe Co. of Oregon will furnish for a pipe line at Everett, Wash. Movement of cast iron pipe and reinforcing steel bar tonnages was confined to lots under 100 tons. Prices continue on a fairly even basis, with little or no shading.

Considerable interest was shown in the opening of the new bolt, nut and rivet plant of the Pacific Coast Steel Co. at South San Francisco on Sept. 12. More than 1000 steel mill representatives, manufacturers and buyers attended the opening ceremonies and luncheon served in one of the bays of the new building. The plant has a capacity of 1200 tons a month.

Pig Iron.—Demand for foundry pig iron has shown little signs of improvement during the past few weeks, sales and inquiries continuing to involve unimportant tonnages. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar awards were confined to lots of less than 100 tons. Out-of-stock distributers in the San Francisco district report few important projects pending and say that the week's business was the poorest for any week so far this year. Bids were opened on 127 tons for the west approach of the St. John's River bridge at Portland and on 285 tons for highway work in Sonoma County, Cal. Prices appear to be firm at 2.30c., base, on carload lots and 2.60c. on smaller tonnages in the San Francisco district, with $2 a ton higher prevailing in the Los Angeles section. Merchant bar steel is quoted at 2.35c., c.i.f., and demand continues to call for small lots composed of numerous sizes.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c'td' nails, 100 lb. keg	3.40

Plates.—Several important pipe line tonnages were placed during the week. The Steel Tank & Pipe Co. took 10,000 tons of plates for the Everett, Wash., pipe line, 2200 tons of 36 and 48-in. pipe for Spokane, Wash., and 330 tons for two 30-in. siphons at Manson, Wash. The Willamette Iron & Steel Works secured 200 tons for gates for the Mount Diablo dam, Seattle. Pending business includes 360 tons of 18-in. welded steel pipe for Montecito, Cal., bids on which have been opened. Prices are firm at 2.35c., c.i.f.

Shapes.—More than 2000 tons of structural shapes were let this week. The largest award called for 400 tons for the West Garfield Street bridge, Seattle, and went to the Pacific Car & Foundry Co. The Consolidated Steel Corporation took 350 tons for a grandstand at Agua Caliente, the United States Steel Products Co. booked 120 tons for a bridge over the San Lucas River, Salinas, Cal., and the Judson-Pacific Co. took 325 tons for a warehouse for the American Can Co. and 150 tons for an apartment house on Sacramento Street, both in San Francisco. Bids have been opened on 335 tons for the west approach of the St. John's River bridge, Portland, and on 136 tons for a grandstand at Riverside, Cal. Bids were also opened on 738 tons for a bridge over the Shasta River near Yreka, Cal. Plain shapes remain firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe is unusually quiet, and tonnages placed this week were confined to lots of less than 100 tons. Only a few small awards were reported. Pending business involves less than 1500 tons. Anaheim, Cal., will place 377 tons of 6 to 10-in. Class B pipe next week. No new inquiries of importance came up for figures this week.

Track Material.—The United States Steel Products Co. took 550 tons of girder rails, 450 tons involving 105-lb. rail, 21,000 tie plates, 13,000 brace tie plates, 30 kegs of track bolts, 130 kegs of track spikes and 82 special layouts for the municipal railroad, San Francisco. It was also low bidder on 40 tons of 128-lb. girder rails and other specialties for the Port Commission, Oakland.

Birmingham

Southern Pig Iron Buying Gains—Another Blast Furnace Goes Out—Steel Backlogs Still Large

BIRMINGHAM, Sept. 17.—Sales of pig iron to district consumers are at an undiminished rate. Apparently confident that the volume of business will hold up for the remainder of the year, some of the larger consumers are covering their entire fourth quarter requirements. A feature of the market last week was a notable increase in requisitions followed closely by urgent tracers. With increased foundry melt in prospect and with the blowing out of another furnace, the market is in a stronger position as regards prices, though there has been no intimation of price advances. Sales to outside points have slumped considerably in the past few days, possibly because of higher prices quoted. The district price for No. 2 foundry remains at $14.50. Concessions from this price on Eastern and Middle West sales are less than they were 10 days ago. Shipments are at the highest point of the year. The No. 4 North Birmingham furnace of the Sloss-Sheffield Steel & Iron Co. has been blown out, leaving a total of 13 active furnaces. Of this number, eight are on foundry and five on basic iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Indications are that there will be no material decrease in new business in plates, bars, structural shapes and sheets before the arrival of the fall buying period. Backlogs in these lines have been well maintained during the past few weeks. There has been no further reduction in operations since the rail mill at Ensley was shut down about the middle of August. Orders on books are sufficient for three to four weeks' operations. Wire product demand is improving. Structural steel fabricating shops are working off backlogs. The majority of the plants report both demand and new business at the low point of the year so far. The Virginia Bridge & Iron Co. has booked 400 tons for airplane hangars in Brazil and 200 tons for a hangar at Atlanta, Ga. Reinforcing bar demand has declined since August and can hardly be considered up to normal. All finished steel prices are the same. Seventeen open-hearths are active, the same as last week.

Cast Iron Pipe.—Pressure pipe plants continue to work off backlogs as new business falls short of output. Operations at individual plants vary from 65 to 80 per cent of capacity. The bulk of new business in the past week was in small lots, occasionally supplemented by fair-sized tonnages from the West and Middle West. Several municipalities in the Southern territory that have construction programs prepared are still holding off because of an unsatisfactory market for their bonds. Nashville, Tenn., is taking bids this week for 3400 ft. of 6-in. pipe. About the same amount is to be bought a little later. Other

projects to be awarded this week include 11,600 ft. of 4-in. and 3700 ft. of 6-in. pipe for St. Joseph, La., and 3700 ft. of 6 and 8-in. pipe for Brooklet, Ga. Prices remain steady at $37 to $38 a net ton, base Birmingham.

Coke.—The movement of foundry coke is better than the August average. Prospects are reported brighter for further increase in demand. Prices remain at $5 a net ton, Birmingham.

Old Material.—One of the larger users of steel scrap has withdrawn from the market on account of reduced open-hearth operations. Purchases by other users of steel grades are in undiminished volume. Cast iron grades improved slightly during the past week. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.50
Tramcar wheels	13.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem	13.50 to 14.00

Cincinnati

Southern Pig Iron Firmer But Sales Decline—Sheet Steel Sales Gain—Scrap Weaker

CINCINNATI, Sept. 17.—With district consumers of pig iron well covered for the remainder of this quarter and reluctant to close for the fourth quarter, sales of pig iron declined last week. The total amount placed was about 8800 tons, of which 1800 tons was Southern iron in 100 and 200-ton lots. Increased firmness in Southern iron is reflected in reports that all Southern furnaces except one are now quoting $14.50, base Birmingham, in this district and the lowest price at which this iron is obtainable here is $13.50. Although part of the business last week went at $13.50 and $14, selling agents are without authority to quote less than formal schedules, but concessions of about 50c. on tonnage orders are likely. The largest order during the week was from a central Ohio consumer, which took 2500 tons of Northern foundry iron for fourth quarter at a price which figures back to $18.50, base Lake furnace. A Cincinnati buyer bought 750 tons of Northern foundry iron and two Southern Indiana consumers each took 600 tons of the same grade. A Dayton, Ohio, consumer is inquiring for 350 tons of Northern foundry iron, and the Louisville & Nashville Railroad is in the market for 351 tons, of which 25 tons is charcoal iron.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material. — Continued liberal specifications from users of sheets brought new tonnage of district sheet mills well ahead of output during the last week, adding to backlogs. This demand, however, is due in a large degree to the desire of consumers to assure a steady supply of material, and, accordingly, they are specifying in larger quantities in anticipation of their needs for 40 to 90 days. The situation on galvanized sheets in the Southern market is reported to have become somewhat steadier and more in line with the continued adherence to price schedules in other lines. Wire products and wire nails, however, are still weak and sluggish, because of uncertainty of prices. Nails are reported to be obtainable at substantial price concessions.

Coke. — Shipments of by-product foundry coke are going forward at fair rate, although specifications are slightly under the August level. Beehive coke also is showing some activity, one oven representative reporting that 32 spot carloads were shipped last week. The Louisville & Nashville Railroad is in the market for 470 tons of foundry coke for fourth quarter.

Old Material.—Continued reluctance of the mills to take scrap at increased prices has forced dealers' schedules down for the first time in three months. Dealers, however, are still bidding strongly for heavy melting steel, cast iron borings, machine shop turnings and No. 2 wrought, but are offering 25c. a ton less than a week ago. It is reported that recent railroad lists brought prices equal to those paid a month ago, and in a few instances dealers are said to have paid higher prices. Accordingly, with good scrap none too plentiful, it is the opinion in the trade that the present softness of the market is only temporary.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.00 to $14.50
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.00 to 9.50
Machine shop turnings	8.25 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.00 to 14.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb.	3.75
	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.00
4-in.	33.00
Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

Canada

Pig Iron Buying for Last Quarter Begins

TORONTO, ONT., Sept. 17.—Canadian blast furnace representatives have opened books for pig iron for last quarter delivery. Forward buying has become fairly active and a number of contracts have been closed. About 5000 tons is pending for early closing. Sales in the past week for spot delivery were upward of 2000 tons. Prices are unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—A stronger demand has developed for building steel. Contracts placed during the week exceeded 10,000 tons, most of which was in orders for lots under 500 tons. Upward of 20,000 tons is pending for early closing and other large tonnages are in prospect.

Old Material.—Business in this market is developing on a larger scale. Orders run strongly to the iron grades, In steel scrap, the demand is most active in the Montreal market, where buying is reported for domestic consumption as well as for export. Prices are firm but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel borings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	16.00	20.00
Axles, wrought iron	17.00	22.00
No. 1 machinery cast	....	17.00
Stove plate	....	13.00
Standard carwheels	....	16.00
Malleable	....	13.00
	Per Net Ton	
No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

St. Louis

Southern Pig Iron Sales in District Totalled 125,000 Tons —Scrap Prices Decline

ST. LOUIS, Sept. 17.—The heavy buying movement in Southern pig iron, which began about 30 days ago and which resulted in the sale of more than 125,000 tons to melters in this district, according to trade estimates, is said to have subsided. Because of the placing of this large tonnage, it is not expected that there will be much buying during the remainder of the year. The three leading pig iron producers in the South are now regarded as being well booked, and the market is firmer. The drive of Southern makers was to find an outlet for their surplus iron, and prices naturally have varied, ranging from $12.50 to $13.50. Included in the Southern sales was a good tonnage of basic, some new users being developed as a result of the campaign. One of the Southern makers, Republic Iron & Steel Co., is now out of the market. Sales of the St. Louis Gas & Coke Corporation in the past week totaled about 1800 tons, of which 400 tons was malleable. A St. Louis jobbing foundry took 500 tons, a Diesel engine builder took 270 tons, a jobbing foundry in Kansas and an Alabama pipe foundry bought 100 tons each, all foundry. All sales, excepting a few spot carloads, were for shipment over the remainder of the year.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—Railroads centering in St. Louis have issued requests for prices on fourth quarter requirements of plates, shapes, bars and sheets, with no quantities specified. Both new business and specifications in the items named are light. Structural business is light.

Old Material.—The market for steel works scrap is weaker because of large purchases of basic iron to replace scrap, heavier movement of material to this market from the railroads and country dealers and smaller buying by mills. An improvement is expected within the next 30 days. No. 1 heavy melting is down 25c. a ton and No. 2 grade is off 50c. Railroad lists include: Chesapeake & Ohio, 7481 tons; Louisville & Nashville, 3075 tons; Missouri-Kansas-Texas, 1500 tons; Chicago, Indianapolis & Louisville, 1125 tons; Chicago & Alton, 1200 tons; Chicago, Rock Island & Pacific, 100 tons; Great Northern, 65 carloads; Nickel Plate, 54 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.25 to $14.75
No. 2 heavy melting or shoveling steel	13.50 to 14.00
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand-sec. rails including frogs, switches and guards, cut apart	16.75 to 17.25
Railroad springs	19.00 to 19.50
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	14.25 to 14.75
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	17.00 to 17.50
Machine shop turnings	7.50 to 8.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	13.00 to 13.50
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.

Youngstown

Demand for Sheets and Pipe Sustains Operations in Valley District at 85 to 90 Per Cent

YOUNGSTOWN, Sept. 17.—Definite indications of the trend of steel demand in this district during the last quarter are still lacking, but Valley steel makers are firm in the opinion that improvement in both new orders and specifications may be expected in the next 30 days. With fourth quarter contract buying imminent, considerable expansion of order books is practically certain, but it is not yet known whether this expansion will be as large as usual, or whether large steel consumers will immediately issue rolling authorizations in greater volume than they have in the last month.

No price changes are being made for the next quarter, so steel users have no price incentive for specifying beyond their immediate needs. They may even go so far as to defer the placing of fourth quarter contracts, as considerable steel is still owed them on present contracts in some cases.

Operations in the Valley district average from 85 to 90 per cent and are being sustained principally by the large demands upon the sheet and pipe mills. Sheet mills are still operating at above 90 per cent, and backlogs of some large makers insure the continuance of this rate for another month. Others will have to curtail sharply by Oct. 1, unless specifications increase. Pipe units are at the best rate of the year and makers are optimistic for the remainder of the period. Tin plate production has dropped to 75 per cent and will go lower before fall buying develops. Bar mills have also curtailed sharply, the operations of the Steel Corporation units alone keeping up the general average for the district.

The Youngstown area can expect little benefit from developing rail and rail equipment purchases, and, aside from large local consumers of its principal products, must look to the automobile industry as the principal outlet for its surplus steel.

In placing its October requirements, this industry has given Valley mills little encouragement. The Ford Motor Co. will require less steel than it took in September on account of its decline from a six-day to a five-day week operation, and other large users of Youngstown steel in the Michigan district are releasing specifications slowly. At no time in the recent past has the automobile industry conformed its steel buying so closely to the probable market for cars. This year, however, the heavy automobile production during the first eight months has focused attention sharply on the possible limits of car purchasing.

Prices of both finished and semi-finished steel seem to be holding in this district. In fact, large producers direct attention to the price structure as the most favorable factor in a rather uncertain market. At least three large makers say that they will take no fourth quarter business on galvanized sheets at less than 3.60c., Pittsburgh, and intend to limit the number of jobbers to whom they will give the usual $2 preferential. Third quarter prices on black, blue annealed and automobile body sheets will be continued, and considerable fourth quarter tonnage has been placed at those figures. However, the bulk of such business is yet to come to mill order books. Strip prices apparently are holding at 2.75c. to 2.85c., Pittsburgh, for cold-rolled and 1.90c. and 2c. on hot-rolled. Production has been sharply cut down, however, and this is

pointed out as an evidence of price strength. Some makers presumably would rather close down a mill for a week or even longer rather than take business at concessions. In the case of hot-rolled strip such a policy is declared to be justified on account of the narrow margin of profit possible.

On billets, slabs and sheet bars, makers are quoting $35, Youngstown, on fourth quarter business. The price has not been adequately tested except in the case of sheet bars. Fourth quarter pig iron buying is not yet in evidence, although a few fair-sized inquiries have appeared. Prices will be unchanged at $18.50, Valley, for foundry and basic, and $19 for malleable and Bessemer. Furnaces in this district have been too well supplied with orders this summer to feel the competition of the Pittsburgh merchant furnace, but have recently had to shade their prices 50c. or more a ton to take business in the Pittsburgh district. Such shading has not affected the price on iron going to points where Pittsburgh furnace competition is not met.

The scrap market has softened in the last week, but not as decidedly as has been the case in Pittsburgh, where the competition between dealers has had an unusually depressing effect.

Boston

Pig Iron Prices Firmer—Scrap Market Unsettled as Demands From Steel Mills Fall Off

BOSTON, Sept. 17.—Buffalo iron at $17 a ton, base furnace, has disappeared from this market. Attractive tonnages of No. 2X Buffalo iron can be purchased at $18 a ton, and No. 1X at $18.50, but on the general run of current bookings $18.50 and $19 respectively are being obtained. The firmer Buffalo prices are the result of smaller offerings of Buffalo and New York iron, and lessened competition from Southern iron due to an advance in prices for the latter. The Mystic Iron Works also is securing slightly higher prices for its product. The firmer prices, however, come at a time when little actual business is in view. The Sullivan Machinery Co., Claremont, N. H., is in the market for 400 tons of prompt shipment iron, the only open inquiry. Sales the past week did not run much above 3000 tons, mostly Mystic and Buffalo. The largest individual sale was 500 tons to a Connecticut foundry.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	21.91 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.41 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Coke.—It is now safe to predict that consumption of foundry coke in New England in 1929 will run ahead of that of 1928, possibly by 15 per cent. Current shipments are in good volume. The price of by-product fuel remains at $11 a ton, delivered within a $3.10 freight rate zone. Production and shipments of domestic coke by New England manufacturers continues on an increasing scale.

Fabricated Steel.—The market is more active than appears on the surface. Most fabricators report prospects more encouraging than a week ago, with competition keener than ever. To illustrate this point a Providence, R. I., fabricator, rarely taking business in Massachusetts, will fabricate 30 tons for a Cambridge, Mass., job. Some fabricators are figuring on a large tonnage of steel on a pound cost basis, present negotiations involving more than 5000 tons, with prospects of large additional tonnages by early October. Boston is endeavoring to secure lower prices on its Congress Street bridge, but fabricators are holding to bids submitted.

Reinforcing Steel.—Business in billet steel bars is slow in closing, sales the past week totaling 300 tons in dribbling lots, at 2.66½c., a lb., base, from stock. Several attractive tonnages are pending. Not much life is shown in the rail steel bar market, but there has been less shading of the open price, 2.26½c. a lb., base, delivered common Boston freight rate points.

Old Material.—The scrap market is decidedly unsettled owing to weakness of prices in the Pittsburgh district and to the holding up of shipments by steel mills. Demand for No. 1 heavy melting steel is practically flat, a condition not existing in months. A few lots of steel turnings were bought on old contracts the past week at $7.50 a ton, on cars shipping point, but on new business $6.60 is the best price obtainable. There is some demand for pipe, but a limited supply, and prices are relatively firmer than for most other kinds of scrap. The Boston & Maine Railroad on Sept. 13 closed bids on approximately 80 cars of miscellaneous material. Prices obtained were lower than realized at the company's August sale. New England consumption of machinery cast holds up well and prices are steady. The German steamer Cronshagen has been chartered to load 4500 tons of scrap here for Danzig delivery, the rate being $6 a ton.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$11.75 to $12.25
Scrap T rails	11.00 to 11.25
Scrap girder rails	10.00 to 11.00
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.60 to 7.50
Cast iron borings (steel works and rolling mill)	6.50 to 6.75
Bundled skeleton, long	10.00 to 10.25
Forge flashings	10.00 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.50
Shafting	14.00 to 14.50
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.00 to 12.50
Cast iron borings, chemical	9.75 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.50
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.00 to 18.50

Heavy Melting Steel Scrap Off 25c. at Detroit

DETROIT, Sept. 17.—Heavy melting and shoveling steel have declined 25c. a ton. There have been very few sales involving tonnage. Prices generally are on the low side of the quoted range.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

Big Rivet Job

It was estimated that the Merchandise Mart now under construction at Chicago, would require some 50,000 tons of structural steel. The latest information is that it will reach 58,000 tons, not including reinforcing steel and the ornamental iron part of the contract. There are on an average 12 rivets to a ton for this particular type of building, or 700,000 rivets all told.

Buffalo

Pig Iron Sales Upward of 12,000 Tons—8000 Tons of Structural Steel Awarded for City Hall

BUFFALO, Sept. 17.—Between 12,000 and 15,000 tons of pig iron was sold by Buffalo furnaces during the past week. It is now believed that most of the large buyers are covered for the remainder of the year except for emergency requirements. Included in the aggregate tonnage sold were several lots of 200 tons of foundry and malleable, several of 500 tons, one of 1200 tons and one of 1800 tons. An eastern purchaser bought 2500 tons of foundry and malleable, about half of each. The Ingersoll-Rand Co. is understood to have bought 700 tons of malleable. The Baldwin Locomotive Co. has an inquiry pending for 1500 tons of malleable. Most of the past week's business was taken on an $18 Buffalo, base, all-rail delivery. In some cases differentials were waived. Nothing under $19.50, Buffalo, has been taken for district delivery, it is stated, and the Buffalo price in the East has now strengthened to the point where $18.50 is being more freely quoted than $18.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—The most important development in the fabricated structural field in the last week was the awarding of 8000 tons for the New City Hall of Buffalo to the McClintic-Marshall Co. Several other smaller fabricated structural lots were closed, all less than 100 tons. The reinforcing bar market has been brisk, with one lot of 500 to 600 tons for the Buffalo General Electric Co. and some smaller lots placed. Operations of local mills continue at the same rate as recently, about 90 per cent average or better. Sheet business in particular is good.

Old Material.—A sale of a comparatively small tonnage of No. 1 heavy melting steel was made during the past week at a price reported to be $17.50 to $17.75, indicating a slight weakening in this commodity. Some sales of short rails were reported at $19.50, but there appears to have been very little other buying. Business from foundries has dropped off considerably. Three of the local blast furnace interests continue to take in blast furnace scrap on old orders, but there has been no new buying. There has been quite a reduction in the production of scrap, several of the automobile plants being on lower schedules than heretofore.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.50 to $17.75
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	9.00 to 9.50
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	19.50 to 19.75
Coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades:	
Short shov. steel turnings	12.50 to 13.00
Blast Furnace Grades:	
Short mixed borings and turnings	11.50 to 12.25
Cast iron borings	11.50 to 12.25
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	16.00 to 17.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb	3.75

Railroad Equipment

Santa Fe To Buy 5754 Cars, Southern 2000 or More—Outlook Improved

WITH the announcement that the Atchison, Topeka & Santa Fe will buy 5754 freight cars and that the Chesapeake & Ohio will shortly come into the market for a large number of cars, together with an inquiry from the Southern for 2000 cars and the possibility that double this number may be purchased, the outlook for railroad equipment buying over the remainder of the year is more promising.

Orders so far this year placed with car builders total about 61,700, including 1000 just placed by the Central of Georgia, but not including 1000 car bodies ordered a few days ago by the Norfolk & Western. In addition to orders placed with car builders, railroads have arranged this year for the building of 9000 cars in their own shops.

Deliveries of cars so far this year by car companies total about 10,000 above those completed during the same period of 1928.

Details of the week's business follow:

Atchison, Topeka & Santa Fe is asking for prices on 3500 box cars, 500 automobile cars, 500 refrigerator and 200 stock cars, 300 mill type gondola cars, 150 flat and 100 tank cars, 104 cabooses, 200 ballast and 200 gondola cars.

Akron & Barberton Belt Railway is in the market for three 6-wheel switching locomotives.

Chicago & North Western is in the market for 500 flat cars.

Chesapeake & Ohio is expected to come into the market shortly for a large number of cars.

Central of Georgia has ordered 500 gondola cars and 500 flat cars from Pullman Car & Mfg. Corporation to be built at the latter's new shop at Birmingham.

Norfolk & Western has ordered 1000 steel hopper car bodies from Virginia Bridge & Iron Co. Action has not yet been taken on the 2000 hopper cars for which this road is in the market.

Southern Railway has inquired for 1000 box cars and 1000 hopper cars, but may buy twice this number.

Dupont Co. is inquiring for 45 alcohol cars.

South African Railways are in the market for 150 50-ton freight cars.

Reinforcing Steel

Awards and Inquiries Are Unusually Light

OF the 2400 tons of reinforcing steel lettings in the past week, 500 tons will be required for an industrial plant at Buffalo. New jobs for which bids are being asked total less than 1000 tons. Four hundred tons will be used for a stadium at Notre Dame, Ind. Awards follow:

STATE OF NEW JERSEY, 300 tons, highway bridges, to Igoe Brothers.

PHILADELPHIA, 100 tons, school.

BUFFALO, 500 tons, Buffalo General Electric plant, to local producer.

CLEVELAND, 100 tons, Flora Mather House for Western University, to Bourne-Fuller Co.

FINDLAY, OHIO, 100 tons, Ohio Oil Co., to Bourne-Fuller Co.

CHICAGO, 350 tons, department store for A. E. Anderson, to Olney J. Dean & Co.

CHICAGO, 150 tons, factory for Oscar Wolff, to an unnamed bidder.

CHICAGO, 100 tons, garage on Crosby Street, to Calumet Steel Co.

CHICAGO, 275 tons, apartment building at 1530 North State Street, to Concrete Steel Co.

NILES CENTER, ILL., 100 tons, paving, to Concrete Steel Co.

HENRYETTA, OKLA., 105 tons, project for Rust Engineering Co., to Truscon Steel Co.

JUNEAU, ALASKA, 350 tons, post office, to Concrete Steel Co.

JUNEAU, ALASKA, 200 tons, United States territorial building, to Concrete Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK CENTRAL RAILROAD, 150 tons, viaduct at 241st Street, New York.

BUFFALO, tonnage unstated, building for *Buffalo Courier Express*.

NOTRE DAME, IND., 400 tons, stadium for University of Notre Dame.

PORTLAND, ORE., 127 tons, west approach, St. John's River bridge; bids opened.

SACRAMENTO, CAL., 285 tons, paving work in Sonoma and Marin Counties; bids opened.

The number of electric hoists ordered in August dropped 13.3 per cent from the July number, but the value increased 6.2 per cent.

Non-Ferrous Metal Markets

Copper Quiet But Firm—Tin Inactive and Weak—Lead and Zinc Firm

NEW YORK, Sept. 17.

Copper.—Following the heavy sales of more than 100,000 tons to domestic consumers for the week ended Sept. 7, noted in this column a week ago, the market has turned quiet. Sales to domestic consumers the past week have been made practically every day in fair tonnages. Consumers are reported to be well covered into November and, as indications seem to point to a stabilized price of copper for some time to come, some are buying only what their needs justify. Foreign consumers are purchasing more liberally and sales have been in good volume almost every day. They are not covered far ahead and still have considerable to buy for September and October. After the impending prospect of higher prices a week ago which did not materialize, the market has continued at the steadfast price of 18c. for electrolytic copper, delivered in the Connecticut Valley. The quotation of Copper Exporters, Inc., is maintained at 18.30c., c.i.f. usual European points. In accordance with the expectations of some well-posted on conditions, the statistics for August showed an increase in copper above ground of about 9000 tons; of this 7000 tons was refined metal and 2000 tons was blister copper. Output at the mines changed very little in August from July. Lake copper is also strong and steady at 18c. to 18.12½c., delivered.

Tin.—Conditions noted a week ago continue. Dullness is pronounced and business is at a standstill. Something less than 500 tons of spot Straits tin was sold during the week ended Sept. 14. The only metal being sold is for spot delivery, prices for which have hardly varied during the last week. Yesterday and today there has been no activity and spot Straits tin is quoted very weak at 45c., New York. Prices at London are a little higher this week than last, with spot standard quoted at £205 7s. 6d., future standard at £209 5s. and spot Straits at £209 7s. 6d. The Singapore market today was £214 7s.

Lead.—After the heavy buying of two weeks ago the market has been quiet, but demand has been fairly good. Purchasing has not extended beyond October, although there is some inquiry for November. Prices are very firm at 6.70c., St. Louis. The

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Sept. 17	Sept. 16	Sept. 14	Sept. 13	Sept. 12	Sept. 11
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½	18.12½
Electrolytic copper, N. Y.*	17.75	17.75	17.75	17.75	17.75	17.75
Straits tin, spot, N. Y.	45.00	45.42½	45.37½	45.37½	45.25	45.37½

Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

quotation of the leading interest is unchanged at 6.90c., New York.

Zinc.—Consumers still refrain from covering their needs even for fairly early shipments, and producers decline to lower prices which continue at 6.80c., East St. Louis, or 7.15c., New York, for prime Western zinc. It is confidently expected that, if this stand-off continues long enough, there will be a rush to buy similar to that in copper two weeks ago, but of course not so spectacular as to volume.

Antimony.—Demand is very light and Chinese metal is quoted at 8.75c., per lb., New York, duty paid, for all positions.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. per lb. with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered, as the published price.

Non-Ferrous Metals at Chicago

CHICAGO, Sept. 17.—This market is quieter than a week ago. Prices, with the exception of tin, which is quoted lower, are unchanged. Demand for old metals is light and prices are not being tested.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 46.10c.; lead, 6.80c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.85c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Fabricated Structural Steel

With Awards of 50,000 Tons and Inquiries of 57,000 Tons, Demand Has Been Well Maintained

WITH total awards of 50,000 tons and with 57,000 tons added to pending work in the past week, demand for structural steel has been well maintained. Most of the jobs let recently and the bulk of fresh inquiries are for office buildings, hotels, educational structures and other non-industrial projects. Outstanding among awards were 8000 tons for a city hall at Buffalo and 5000 tons for bridges on the Great Northern Railway. Much interest has centered on the tonnage required for the Empire State Building, New York. Forty thousand tons is the present estimate, but it is possible that as much as 45,000 tons will be needed. Awards follow:

BOSTON, 350 tons, apartment house on Newbury Street, to New England Structural Co.

LYNN, MASS., 300 tons, theater, to New England Structural Co.

WOBURN, MASS., 180 tons, lighting company substation, to unnamed fabricator.

PROVIDENCE, R. I., 120 tons, United States Rubber Co. plant, to Providence Steel & Iron Co.

NEW YORK, 300 tons, three seaplane hangars for delivery to Brazil, let by Dwight P. Robinson & Co., to Belmont Iron Works.

NEW YORK, 4000 tons, revised estimate for Waldorf-Astoria Hotel above tonnage reported last week, to McClintic-Marshall Co.

NEW YORK, 350 tons, motion picture theater at 151 East Fiftieth Street and passenger station at Tremont Street and Park Avenue for New York Central Railroad, to McClintic-Marshall Co.

VALLEY STREAM, N. Y., 270 tons, airplane hangars, to Jones & Laughlin Steel Corporation.

PALISADES PARK, N. J., 1000 tons, highway bridges, to American Bridge Co.

PHILADELPHIA, 2500 tons, office building and garage, to McClintic-Marshall Co.

PHILADELPHIA, 1400 tons, Architects' Building, to McClintic-Marshall Co.

ATLANTIC CITY, N. J., 2400 tons, Hotel Brighton, to McClintic-Marshall Co.

ATLANTA, GA., 200 tons, hangar for Pitcairn Aviation, Inc., to Virginia Bridge & Iron Co.

TORONTO, 150 tons, community hall at Church and Shuter Streets, to Dominion Bridge Co.

OSHAWA, ONT., 500 tons, factory for Skinner Co., Ltd., to Disher Steel Construction Co., Toronto.

DONNACONA, QUE., 1000 tons, mill for Price Brothers, to Dominion Bridge Co.

BUFFALO, 8000 tons, Buffalo City Hall, to McClintic-Marshall Co.

PITTSBURGH, 300 tons, Maple Terrace viaduct, to McClintic-Marshall Co.

HAMILTON, OHIO, 900 tons, bank building, to Wheeling Structural Steel Co.

NICKEL PLATE RAILROAD, 600 tons, bridge at Cleveland, to Mount Vernon Bridge Co.

PAINESVILLE, OHIO, 300 tons, trestle for Diamond Alkali Co., to American Bridge Co.

BARBERTON, OHIO, 460 tons, Babcock & Wilcox Co., to American Bridge Co.

CHICAGO, 250 tons, Gateway Theater for Balaban & Katz, to Midland Structural Steel Co.

CHICAGO, 150 tons, building for M. Clamitz Co., to Calumet Structural Steel Co., local.

CHICAGO, 2500 tons, garage on Quincy Street, to American Bridge Co.

GREAT NORTHERN, 5000 tons, bridges, to American Bridge Co.

CHICAGO, ROCK ISLAND & PACIFIC, 135 tons, bridge, to American Bridge Co.

MILWAUKEE, 1000 tons, hotel, reported to have been taken by Lakeside Bridge & Steel Co.

STATE OF OKLAHOMA, 2000 tons, highway bridge work, to J. B. Klein Iron & Foundry Co.

REGINA, SASK., 450 tons, technical school, to Manitoba Bridge & Iron Works.

MANSON, WASH., 330 tons, plates, two siphons, to Steel Tank & Pipe Co. of Oregon.

SEATTLE, 400 tons, plates and shapes, taintor gates for Mount Diablo Dam, to Willamette Iron & Steel Co.

SEATTLE, 400 tons, West Garfield Street bridge, to Pacific Car & Foundry Co.

EVERETT, WASH., 10,000 tons, plates, pipe line, to Steel Tank & Pipe Co. of Oregon.

SAN FRANCISCO, 150 tons, apartment building addition, Sacramento and Mason Streets, to Judson-Pacific Co.

SAN FRANCISCO, 325 tons, warehouse for American Can Co., to Judson-Pacific Co.

SAN FRANCISCO, 200 tons, apartment building, Van Ness and Greenwich Streets, to Golden Gate Iron Works.

BERKELEY, CAL., 110 tons, dormitory for University of California, to Pacific Coast Engineering Co.

SALINAS, CAL., 120 tons, bridge over San Lucas River, to United States Steel Products Co.

SAN DIEGO, 200 tons, Herbert Hoover High School, to National Iron Works.

AGUA CALIENTE, MEXICO, 350 tons, grandstand, to Consolidated Steel Corporation, Los Angeles.

OGDEN, UTAH, 145 tons, two bridges in Zion National Park, to Reynolds Ely Construction Co., general contractors.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

LOWELL, MASS., 350 tons, hocky rink.

CONCORD, N. H., 200 tons, State hospital unit.

NEW HAVEN, CONN., 1000 tons, building at Yale University.

STATE OF NEW YORK, 1000 tons, highway bridges.

NEW YORK, 2000 tons, building for American Museum of Natural History.

NEW YORK, 40,000 tons, Empire State Building at Thirty-third Street and Fifth Avenue.

NEW YORK, 1000 tons, highway bridge in Richmond Borough.

HAMILTON, ONT., 1000 tons for McMaster University.

LONDON, ONT., 1000 tons, office building for Huron & Erie Mortgage Corporation.

FLINT, MICH., 2000 tons, bank building.

FLINT, 400 tons, building for Checker Cab Co.

STATE OF OHIO, 100 tons, bridge at Elyria for Highway Department.

CLEVELAND, 150 tons, building for Champion Machine & Forging Co.

CLEVELAND, 300 tons, club house for Catholic Ladies' Slovak Union.

AKRON, OHIO, 3000 tons, Polsky department store.

CLEVELAND, 1000 tons, grade elimination work for Big Four Railroad and Cuyahoga County.

LAKE COUNTY, IND., 850 tons, highway bridges.

ST. LOUIS, 900 tons, for Krey Packing Co.

RIVERSIDE, CAL., 136 tons, grandstand; bids opened.

MONTECITO, CAL., 360 tons, plates, 18-in. welded steel pipe line; bids opened.

PORTLAND, ORE., 335 tons, west approach, St. John's River bridge; bids opened.

VICTORIA, B. C., 500 tons, Thompson River bridge for Provincial Government.

Ludlum Steel Co. announces that all business in the Cleveland district will hereafter be handled from its office at 1593 East Forty-first Street. T. C. Sherman is local manager of the alloy division and W. H. White local manager of the tool steel division, at that address.

PERSONAL

RALPH H. SWEETSER, assistant to the first vice-president of the American Rolling Mill Co., Columbus, Ohio, will read a paper on "Personality in Pig Iron" at the World Engineering Congress in Japan in October. Mr. Sweetser is an authority on pig iron and many present-day practices originated at his furnaces, most important of which are in connection with control and elimination of waste.

—

C. E. SMITH, vice-president, New York, New Haven & Hartford Railroad, has been placed in charge of the department of purchases and stores, succeeding N. M. RICE, who died recently. He will continue to assist the president in engineering matters.

—

JAMES G. PATTILLO, JR., has been appointed manager of the Pittsburgh sales office of the Wagner Electric Corporation, St. Louis. He is a graduate of the University of Pittsburgh and received further electrical engineering training as a student engineer at the Wagner plant in St. Louis. Later he was transferred to Pittsburgh as a salesman, from which position he was promoted to branch manager.

—

F. G. HOUSMAN, superintendent of the machinery division of Peck, Stow & Wilcox, Southington, Conn., is to serve on the advisory committee of the Connecticut board of education in matters pertaining to foundry training in State trade schools and in industrial companies.

—

H. PAUL CLEAVER has been appointed superintendent of the J. G. Brill Co.'s Philadelphia plant, succeeding O. C. KAHLER who recently resigned for reasons of health. Graduating as a mechanical engineer from the University of Delaware in 1918, Mr. Cleaver became connected with the Harlan plant of the Bethlehem Shipbuilding Corporation, Wilmington, Del. In 1920 he was made general foreman of the car department, and the following year assistant superintendent. In 1926 he joined the engineering staff of the J. G. Brill Co. and later was appointed general foreman. Early this year he became asistant superintendent.

—

G. B. SHEERS, for some time associated with the Moltrup Steel Products Co., Beaver Falls, Pa., manufacturer of cold drawn steel, is now identified with the Reliance Mfg. Co., Massillon, Ohio, where he is engaged in special development work.

—

ARTHUR T. MOREY, General Steel Castings Corporation, Commonwealth Plant, Granite City, Ill., has been appointed to the Department of Manufactures Committee of the Chamber of Commerce of the United States.

—

ALFRED B. EMRICK, for two years branch manager at Pittsburgh for the Wagner Electric Corporation, St. Louis, has been put in charge of a new branch office at 734 Allen Building, Dallas, Tex., with sales jurisdiction over Texas and parts of Louisiana and Arkansas.

—

C. L. MILLER, Pittsburgh, formerly vice-president and general superintendent of the American Steel & Wire Co., sailed for Europe on the Bremen last week.

—

HARRY E. GROSS, formerly associated with the A. M. Byers Co., Pittsburgh, has joined the sales organization of Thomas J. Llewelyn & Co., 911 Oliver Building, Pittsburgh. This company is engaged in consulting engineering work for steel plants and pipe mills and is also sales representative for the Falls Electric Furnace Corporation, Buffalo; the Harold E. Trent Co., Philadelphia, maker of electric melting pots, and the R. S. Newbold & Sons Co., Norristown, Pa., manufacturer of steel plant equipment.

—

W. S. RUGG, vice-president, Westinghouse Electric & Mfg. Co., East Pittsburgh, has been appointed on the committee for the award during the next five years of the Edison medal of the American Institute of Electrical Engineers. The medal, established by the institute of 1909, is awarded for "meritorious achievements in electrical sciences, engineering or arts."

—

H. O. K. MEISTER has been appointed assistant general manager of the Hyatt Roller Bearing Co., Newark, N. J. He has been associated with the company for 15 years, first as manager of its Western division at Chicago, then as assistant general sales manager at Newark and later as general sales manager, having held the latter position since 1925.

—

W. S. RAWLEY has been appointed sales representative in Indiana and Kentucky for the Oliver Machinery Co., Grand Rapids, Mich.

—

W. H. BASSETT, technical superintendent, American Brass Co., Waterbury, Conn., will address the New Haven, Conn., chapter of the American Society for Steel Treating on "Copper and Copper Alloys" at its regular meeting on Sept. 19.

—

RUMSEY W. SCOTT, president, American Cable Co., has resigned to become vice-president of the Commercial Investment Trust Corporation, New York. Previous to his connection with the American Cable Co., Mr. Scott was vice-president of the Chemical National Bank of New York and for 17 years was with the Otis Elevator Co.

—

E. E. BAKER has been appointed sales manager of the Thomas Laughlin Co., Portland, Me., manufacturer of heavy hardware for marine and industrial uses. He has had wide experience in the marine and hardware fields, including marine design and construction, for the last 16 years. During the war he was with the purchasing division of the Emergency Fleet Corporation, handling the purchase of machinery, boilers and mechanical equipment. For the past seven years he has been engaged in industrial heavy hardware sales activities.

—

O. G. NEUMANN has become associated with the sales department of the Inland Steel Co. and will cover parts of Indiana and Michigan, making his headquarters in Chicago. For the past 10 years he has been with the Jones & Laughlin Steel Corporation, at one time as assistant manager of the Cincinnati warehouse and more recently handling both mill and warehouse sales in Indiana.

—

CARL E. SOMMER has been elected president of the Majestic Stove Mfg. Co., St. Louis. He has been connected with the company for 34 years. For 16 years he was in the sales department and later successively was secretary and vice-president.

—

D. C. TRAVIS, general superintendent, Simmons Co., Kenosha, Wis., metal bed and bed spring manufacturer, has resigned after 27 years of service in the company's mechanical departments and will be succeeded by G. A. SMITH, now general production superintendent. FRANK B. HARMON will be promoted to general production superintendent and PHILLIP HARMON, JR., to assistant superintendent.

—

A. M. LEVERICH, Milwaukee, for the past 8 years representative in Wisconsin of Abrasive Co., Philadelphia, manufacturer of grinding wheels, has resigned to become general manager of the new Camden, N. J., plant of the Rundle Mfg. Co., Milwaukee, maker of plumbing supplies and enameled sanitary ware. He was formerly with Dodge Motor Co., Detroit. J. D. BUCKLEY, Birmingham, will succeed Mr. Leverich.

—

F. B. CALDWELL, vice-president, Link-Belt Co., Chicago, has resigned on account of ill health. W. C. CARTER, formerly vice-president in charge of production of all the company's plants, will succeed Mr. Caldwell. E.

J. BURNELL, manager of the company's Pittsburgh office, has been appointed sales manager of the Western division with headquarters at Chicago. He has been succeeded at Pittsburgh by NELS DAVIS, formerly of the Chicago sales organization.

—

A. W. THOMPSON, formerly president of the Philadelphia Co. and later of the United Gas Improvement Co., both of Philadelphia, has been elected chairman of the board of the McKinney Mfg. Co., Pittsburgh, maker of builders' hardware. J. P. MCKINNEY, JR., who has been vice-president, has been elected president of the company, succeeding W. C. FARR, who remains as treasurer and has also been elected secretary.

—

CHARLES E. HILDRETH, formerly of the Whitcomb & Blaisdell Machine Tool Co., Worcester, Mass., and prominent in national machine tool circles until a few years ago, has been made supervisor for the decennial census next year.

—

G. GUY JETER, connected for the past 16 years with the transformer division of the General Electric Co., has been transferred from the Pittsfield, Mass., plant to Bridgeport, Conn., where he will be manager of power apparatus sales.

—

PERRY W. OLLIVER has been appointed manager of the San Francisco office of the Sullivan Machinery Co., Chicago. He has been with the company since 1914 and for the past eight years has been connected with the El Paso, Tex., office.

—

J. F. WULFETANG, for the last ten years manager of raw materials for the Jones & Laughlin Steel Corporation, Pittsburgh, and previously assistant purchasing agent for that company, has become associated with the Hausman & Wimmer Co., Clark building, Pittsburgh, dealer in scrap iron and steel. Before going with the Jones & Laughlin company, Mr. Wulfetang for twenty years was purchasing agent of the Riter-Conley Co., Pittsburgh.

—

DR. CARL KOETTGEN, president Verein Deutscher Ingenieure and general director Siemens-Schuckert Works, Berlin, Germany; DR. CONRAD MATSCHOSS, director Verein Deutscher Ingenieure, Berlin, Germany; DR. EMIL PROBST, Karlsruhe, Germany, and MAJOR H. C. E. CHERRY, a British engineer, were guests of honor at a dinner attended by about 50 New York engineers at the Engineers' Club, Thursday evening, Sept. 12. DR. ELMER A. SPERRY, president, American Society of Mechanical Engineers, acting chairman of the American committee for the World Engineering Congress at Tokio, presided and responses were made by several of the guests, who are on their way to Japan. A number of other European delegates to the World Engineering Congress who have arrived this month have been entertained by groups of New York engineers. Most of the visitors will stop off at various industrial centers on their way across the continent to take steamer for Tokio.

—

F. W. STICKLES, recently a member of the sales force of H. H. Adams & Co., pig iron brokers, New York, has leased plant at Mystic, Conn., which he will operate as the Capitol Foundry, making special gray iron castings. He formerly operated a foundry under the same name at Hartford, Conn.

—

HIBBARD S. GREENE, formerly vice-president in charge of sales of the Barber-Greene Co., Aurora, Ill., has become assistant to the president of the Chain-Belt Co., Milwaukee.

—

J. F. SPELLACY, for two years general superintendent of the Steubenville, Ohio, works of the Wheeling Steel Corporation, has resigned and has been succeeded by C. A. KRAL, recently assistant general manager. Before going with the Wheeling Company, Mr. Spellacy was identified with the National Tube Co.

Obituary

GARDNER A. MURFEY, who recently resigned as treasurer of the Browning Co., Cleveland, because of poor health, died suddenly Sept. 13 at Fredonia, N. Y., while returning home from a vacation trip. He was 44 years of age.

—

RAY P. MCGRATH, since 1914 manager of the San Francisco office of the Sullivan Machinery Co., Chicago, died on Aug. 25. He had been connected with the company for 22 years, having been associated with the Boston sales office from 1906 to 1914.

—

GEORGE M. JOHNSTON, formerly superintendent of the Clinton, Mass., plant of the Wickwire Spencer Steel Co., and recently in the sales department of the company, died Sept. 13 at his home in Clinton at the age of 36. In 1907 he entered the employ of the Clinton Wire Cloth Co., which subsequently was absorbed by the Wickwire interests.

—

EDWIN LEWIS EDES, president, Edes Mfg. Co., Plymouth, Mass., died at his home in Plymouth on Sept. 3 at the age of 76. He was born in Plymouth and early in life became associated in business with his father, who had set up one of the first zinc rolling mills in this country. After his father's death he became sole proprietor and in 1893 organized the Edes Mfg. Co., which continued the zinc business, the principal product being zinc engraving plates.

—

RICHARD H. VERIAN, for 44 years president of the Enterprise Foundry Co., Rochester, N. Y., died at his home Sept. 9 at the age of 74. Born in Rochester, he entered the foundry business as a boy and in 1884 organized the firm of which he was the head until his death.

Consider Weirton Merging With Detroit Companies

Executives of the Weirton Steel Co., Weirton, W. Va., the Michigan Steel Corporation and the Great Lakes Steel Corporation of Detroit and the M. A. Hanna Co., Cleveland, recently held a meeting in Cleveland at which a consolidation of the companies was discussed.

The new plant of the Great Lakes Steel Corporation at Ecorse, a suburb of Detroit, is now under construction. It will have an annual capacity of about 400,000 to 500,000 tons of steel ingots and its finished products will be hot and cold-rolled strip steel. The plant is expected to be ready for operation in the fall of 1930.

The Great Lakes Steel Corporation was organized by a syndicate headed by George R. Fink, president of the Michigan Steel Corporation, who is also president of Great Lakes. Authorized capital was $50,000,000, of which $20,000,000 was privately subscribed. The M. A. Hanna Co., became financially interested in the venture and also contracted to supply the plant with hot metal from one of its blast furnaces near Ecorse, Mich.

Capacity operations throughout the remainder of the year are indicated, according to a report from Aluminum Industries, Inc., Cincinnati. Consolidation of the company's two branches in San Francisco into one warehouse in the center of the automobile district in the Golden Gate city has been effected.

The profits showing of this year has been examined for 916 companies by the National City Bank, New York. For the first six months the profits amounted to $2,449,907,000, or 27.4 per cent more than the $1,924,264,000 for the first six months of 1928. One group, leather, reported a deficit. Shipping made the best showing, 179 per cent increase, and the next was iron and steel, 102 per cent for 35 companies ($189,209,000 in 1929 and $93,450,000 in 1928). The increase for 21 automobile companies was 4.1 per cent but for 40 automobile accessory companies, 62.4 per cent.

Acme Equipment Co., Inc., Detroit, has removed to its new offices and warehouse at 3352 Michigan Avenue.

Exhibitors and Products to be Shown at Machine Tool Exposition

(*Continued from Page* 743)

saw blades; Atkins hacksaw frames. Represented by: E. C. Atkins, production manager; W. A. Atkins, works manager; Edward S. Norvell, manager metal saw department; W. R. Chapin, metallurgist; M. M. Poole, purchasing agent; D. M. Condit and A. Mertz, salesmen.

Automatic Nut-Thread Corporation, 3617 North Eighth Street, Philadelphia, Pa. Booth 3W 2.

No. 2 and No. 3 Threadnut full automatic nut tapping machines; No. 1 single spindle tapping machine, full automatic; No. 1 hand tapping machine, single spindle; No. 7 single spindle semi-automatic. Represented by: Eric M. deSherbinin, president; Christian S. Sorenson, general manager; Robert B. Webster, secretary-treasurer; Edward H. Ingram, engineer; LeRoy J. Mickle, superintendent.

Avey Drilling Machine Co., Cincinnati. Booth 1A 6.

High-speed sensitive drilling and tapping equipment; drilling units; metal cutting saws; compensating jaw vises. Represented by: L. B. Patterson, president; J. G. Hey, vice-president and general manager; D. A. Patterson, secretary; J. F. Mirrielees, superintendent; F. L. Hazledine and G. M. Galt, factory representatives.

B

Baker Brothers, Inc., Toledo, Ohio. Booth 2B 13.

No. 121 Baker heavy-duty vertical drilling machine with Tex-Rope motor drive; No. 25 H Baker vertical hydraulic feed five spindle six station indexing table drilling and boring machine; No. 25 HH Baker two way hydraulic feed drilling and boring machine; No. 10 H Baker vertical hydraulic feed drilling machine with adaptation for multiple heads; individual motor-driven collant pump outfit. Represented by: H. L. Tigges, W. W. Elliott, William Baker, G. E. Hallenbeck, M. Fischer, G. Temple.

Baker-Raulang Co., 2168 West Twenty-fifth Street, Cleveland. Booth 4W 6.

Model E3 3-ton elevating truck equipped with 1-ton swivel hoist; Model H3 3-ton Hy-lift truck. Represented by: Glen E. Guy, C. H. Reinde, B. C. Hooper, C. H. Warren.

Barber-Colman Co., Rockford, Ill. Booth 1C 2.

Type B production hobbing machine—a new high production gear generator; No. 3 hob sharpening machine—an automatic mechanically controlled hob and form cutter grinder; reamer sharpener—an automatic machine for highly accurate work under positive mechanical control; small tools; hobs, milling cutters, reamers. Represented by: F. G. Hoffman, G. A. DeVlieg, A. B. Brand, J. P. Breuer, R. P. Dewey, M. N. Hough, C. C. Seyfferle, W. W. Dickover, J. E. Wood, F. R. Ridgley, W. M. Hoey.

Barnes Drill Co., Rockford, Ill. Booth 2D 4.

No. 214 multiple cylinder honing machine with hydraulically reciprocated spindles, all geared, self-oiling, all ball bearing; No. 249 self-oiling all geared honing machine with Timken roller bearings and eight quick changes of speeds; No. 242 self-oiling all geared drill and tapper with Timken roller bearings; two spindle No. 242 self-oiling all geared gang drill with Timken roller bearings; No. 221½ self-oiling all geared drill and tapper; No. 262 self-oiling all geared drill and tapper. Represented by: J. E. Andress, president; A. G. Block, secretary; A. M. Johnson, chief engineer; W. M. Fairbairn, production manager; R. M. Andress, purchasing agent; W. G. Nichol and M. C. Hogard, sales department; F. A. Swanson, designing engineer.

W. F. & John Barnes Co., Rockford, Ill. Booth 2B 9.

Horizontal duplex long hole drilling machine; vertical motor-driven Oilgear feed drilling machines; vertical motor-driven Oilgear feed reaming machine with automatic indexing fixture. Represented by: John S. Barnes, V. A. Root, Ralph Billingham, Paul Guirl, William J. Mix, F. G. Vosler.

Leon J. Barrett Co., Worcester, Mass. Booth 1W 13.

Barrett centrifugal oil extractor, model 1200; centrifugal dryer, model 502; centrifugal washer, model 251; Stockbridge heavy-duty back-geared shaper with patented two-piece crank. Represented by: Leon J. Barrett, R. A. Johnson, H. G. Kilbourne, C. B. Laing, N. F. Holter.

John Bath & Co., Inc., Worcester, Mass. Booth 5W 1.

Ground taps; thread gages; ground thread rolling dies; Bath internal micrometers; adjustable plain plug gages. Represented by: John Bath, president; J. Chester Bath, vice-president; Stanley W. Bath, secretary; R. E. Lamb, advertising manager.

Bausch & Lomb Optical Co., Rochester, N. Y. Booth 6A 5.

Metallographic microscope; contour measuring projector; optical comparator; toolmakers' microscope; optical drill gage; internal and external profile gage; optical protractor; optical indexing device; (all precision optical instruments for production control). Represented by: I. L. Nixon, manager projection sales; E. G. Koch, projection sales department; George Gallasch, technical bureau; A. Farmer, salesman.

Charles H. Besly & Co., 118 North Clinton Street, Chicago. Booth 2D 6.

No. 6-20-in. double-spindle motor-driven wet disk grinder with power-driven oscillating fixture, four station indexing drum equipped with cam clamping V-blocks for grinding exhaust and inlet valves on both ends simultaneously; No. 309-30-in. vertical spindle motor-driven wet disk grinder with power-driven rotary and semi-automatic feeding fixture for grinding face of universal joint housings; No. 141-20-in.-L type motor-driven disk grinder with Timken bearing rocker-shaft supports; No. 5-18-in.-F type motor-driven disk grinder; Besly Titan bakelite abrasive disks and steel-back abrasive disks. Represented by: Edward P. Welles, L. R. Capes, L. E. Jacobs, C. H. Munch, F. D. Baker, E. W. Hutchinson, J. F. Curns, George Klemp, R. J. Curns, R. W. Young, John Miller, Jr., John Neilson, Frank Lane, E. O. Powers, Clarence Stephenson, Albert J. Doerman.

Biax Flexible Shaft Co., Inc., 20 East Seventeenth Street, New York. Booth 5A 6.

Screw driving machine; drilling machines; portable flexible shaft grinders; rotary filing machines; rotary files; high-speed grinders for die work; portable sanding and polishing machines; portable track grinders. Represented by: R. Wezel, F. I. VanderBeek.

Black & Decker Mfg. Co., Towson, Md. Booth 4B 1.

Universal portable electric tools; high cycle portable electric tools; Marschke grinders and Marschke swing frame grinders. Represented by: W. C. Allen, R. D. Black, R. E. Mizener, G. M. Buchanan, A. M. York, Lee H. Hind, Gus Fischer, Ralph Herrick, J. A. Fairfield, Luke Boyd, W. J. Fenwick, W. T. Johnston, Guy J. Coffey, C. C. Watts, W. S. Talbott.

G. S. Blakeslee & Co., Chicago. Booth 4C 3.

Blakeslee pump type parts washing machine; Niagara type parts washing machine. Represented by: John Dammers, secretary; H. A. Sparrow, G. W. Anderson and A. S. Reichel, sales engineers.

Blanchard Machine Co., Cambridge, Mass. Booth 1W 5.

Blanchard automatic surface grinder No. 16-A; 18-in. segment wheel; silicate wheels and segments; samples of Blanchard grinding. Represented by: Harold F. Skillings, Harold C. Donovan, Leon S. Kinsman, William H. Cannon.

J. G. Blount Co., Everett, Mass. Booth 1W 2.

Motor grinders—regular and high speed—tool or snagging; combination motor grinder and disk sander for pattern shops; wet tool grinders; motor buffers; pattern maker's lathe—eight speeds, motor drive. Represented by: H. N. Blount, sales manager; J. G. Blount, production manager; F. G. Koppenburg, factory superintendent.

Bowen Products Corporation, Auburn, N. Y. Booth 5A 7.

Bowen system of lubrication for industrial machinery. Represented by: George W. Severson, Willis S. Meeks, Fred Whipple, E. Heilbron.

Boye & Emmes Machine Tool Co., Cincinnati. Booth 3W 7.

16 in. x 6 ft. coneless geared-head lathe; 16 in. head only. Represented by: F. W. Boye, Jr., F. C. Reif, George A. Mohr, shop superintendent.

Bradford Machine Tool Co., Cincinnati. Booth 2A 4.

18-in. Bradford all geared patented Lo-Drive motor-driven engine lathe, with taper turning attachment and oil pan; single spindle automatic unit type Bradford drilling machine for high-speed automatic production. Represented by: Samuel S. Williams, president; Charles J. Smith, secretary; Henry Swift, engineer; Charles Stiefvater, demonstrater; Fred Kropf, superintendent.

Bridgeport Safety Emery Wheel Co., Bridgeport, Conn. Booth 1A 5.

86-in. type No. 94 heavy-duty face grinder, 42-in. sectional grinding wheel, hydraulic table drive; 20-in. steel chuck and sectional grinding wheel. Represented by: H. H. Peck,

secretary; L. I. Burritt, sales manager; F. C. Penny, chief engineer; H. E. Smith, sales engineer.

Brown & Sharpe Mfg. Co., Providence, R. I. Booth 2C 8.
No. 2A standard universal milling machine; No. 4B standard plain milling machine; No. 2 standard vertical spindle milling machine; No. OY plain milling machine; No. 21 automatic milling machine; No. 2 universal grinding machine; No. 13 universal and tool grinding machine; Nos. 11, 30 and 32 plain grinding machines; No. 2 surface grinding machine; No. OOG automatic screw machine (high speed); No. 2 automatic screw machine (high speed); machinists' tools, cutters and hobs. Represented by: J. G. Swinburne, L. Goff, R. W. Blakey, H. R. Johnson, R. Martines, E. S. Thurston, S. H. Sloan, J. H. Devlin, F. L. Pritchard, P. A. Topel, E. H. Anthony.

Bryant Chucking Grinder Co., Springfield, Vt. Booth 2B 12.
No. 24 deep hole grinder with hydraulic slide traverse and automatic sizing; No. 12-A hole-face grinder; No. 3 heavy duty hole grinder; No. 3 standard hole grinder. Represented by: L. C. Gilchrist, W. L. Bryant, M. H. Arms, J. B. Johnson, R. O. Perry, W. M. Smith, G. M. Green, H. G. Nourse, A. G. Fairbanks.

Buckeye Portable Tool Co., Dayton, Ohio. Booth 4A 1.
Portable pneumatic grinders, buffers, drills, sanders, screwdrivers, nut drivers. Represented by: W. W. Price, president; H. O. Gummere, special representative; C. W. Overly, Cleveland district manager; W. R. Gummere, special representative.

Buffalo Forge Co., Buffalo. Booth 1A 4.
Power drills; power bending rolls; combination punches and shears, fans and exhausters, all in operation. Represented by: H. W. Wendt, Jr., vice-president; E. G. Leonard, sales manager tool division; G. H. Zimmer, design engineer; T. A. Weager, manager Cleveland office; A. T. Yates, service engineer; H. H. Weber, J. E. Mossell, R. L. Pope, W. J. McDowell and A. T. Lamb, sales representative.

Buhr Machine Tool Co., Ann Arbor, Mich. Booth 2D 7.
Buhr multihead automatic drilling machines and automatic index tables; Buhr automatic piston drillers; Buhr drilling and tapping heads; Buhr universal adapters and drivers for drill presses. Represented by: Joseph F. Buhr, president; C. A. Birkebak, chief engineer; Glenn D. Evans, sales manager; Robert S. Gott, works manager; William H. Nicholls and Raymond Zoll, sales engineers.

Bullard Co., Bridgeport, Conn. Booth 1B 1.
8-in. Mult-Au-Matic center lathe; 6-in. four-spindle Mult-Au-Matic chucking lathe with hopper feed; 20-in. Auto-Matic vertical turret lathe; 36-in. "Spiral Drive" type vertical turret lathe. Represented by: E. P. Bullard, president; John W. Bray, sales manager; E. P. Blanchard, assistant sales manager; John R. Tillman, executive sales engineer; Charles H. Keller, F. S. Lincoln, Frank E. Hatch, Jr., James M. Welch, George F. Kolb, F. A. Thompson, Robert Newman, William A. Conner, sales representatives.

C

Canedy-Otto Mfg. Co., Chicago Heights, Ill. Booth 5C 10.
Multiple spindle floor drill, motor driven; high-speed motor driven drill press; 21-in., 17-in., 14-in., 15-in. sliding head motor-driven drill presses (all floor drills). Represented by: C. H. Thomas, president; J. E. Thomas, secretary and treasurer; C. L. Hughes, sales manager; G. F. Werth, chief engineer; F. L. Cole, factory manager; R. D. Thomas, W. F. Wendel, L. H. Howard.

Carboloy Co., Inc., 350 Madison Ave., New York. Booth 4A 2.
Carboloy cutting tools for high production machining of ferrous, non-ferrous and abrasive metals and materials; dies for wire drawing and extrusion work for routine high tonnage production in wire mills. Represented by: P. R. Mallory, president; E. H. Wilkinson, vice-president; A. R. Howell, sales manager; G. V. Rockey, advertising manager; G. N. Sieger, metallurgist; A. A. Merry, W. G. Robbins, W. W. Fullager, W. J. Lindner, P. Petroff, W. H. Martin, W. S. Huson, W. G. Lane, W. E. Smith, S. C. Lawson.

Carlton Machine Tool Co., Cincinnati. Booth 2B 2.
3-ft. 11-in. column Carlton all ball bearing, heavy-duty radial drilling machine arranged for constant speed motor drive on arm, with plain box table and cutting lubricant outfit; 6-ft. 19-in. column Carlton all ball bearing heavy-duty radial drilling machine arranged for adjustable speed motor drive on arm, with plain box table, electric hydraulic column binder, motor-driven cutting lubricant outfit, power rapid traverse of head. Represented by: Jack C. Carlton, Harry J. Westmeyer, Herbert D. Keeling, Frank Moran, W. A. Dermody, Albert C. Spangenberg, A. F. Medecke.

Chicago Belting Co., 113 North Green Street, Chicago. Booth 5W 7.
Motor drive belts; flexible idler belts; line and counter shaft belts; charts on belt ratings and belt properties; leather belting; hydraulic and pneumatic leathers; leather packings; leather tannages; motion picture illustration of how leather belt is made. Represented by: J. R. Hopkins, Floyd Hance, Charles Allis Ball, A. J. Weis.

Chisholm-Moore Hoist Corporation, Tonawanda, N. Y. Booth 6B 6.
Electric hoists and trolleys; chain hoists and trolleys. Represented by: F. W. Shaw, assistant sales manager; J. G. Parker, plant engineer; E. N. Turner, sales engineer.

Cincinnati Bickford Tool Co., Cincinnati. Booth 2A 1.
Radial and upright drills including 6-ft. Super-Service radial with 19-in. column; 3-ft. Super-Service radial with 11-in. column; 21-in. direct drive upright; Super-Service production drill. Represented by: A. H. Tuechter, president; G. P. Gradolf, D. C. Klausmeyer, N. C. Shaver, O. E. Shaver, S. K. Wallace, L. D. Quackenbush, R. N. Piper.

Cincinnati Grinders, Inc. Booth 2C 7.
Plain hydromatic miller; Duplex hydromatic miller; No. 3 Universal miller; No. 3 plain miller; Cincinnati cutter grinder; Cincinnati No. 2 centerless valve tappet grinder; No. 2 centerless piston pin grinder; No. 4 centerless bearing race grinder; 14 x 48 plain cylindrical grinder. Represented by: F. A. Geier, F. V. Geier, P. O. Geier, W. W. Tangeman, F. B. Heitkamp, R. E. W. Harrison, G. W. Binns, J. E. Caster, L. Nenninger, Hans Ernst, M. R. Romaine, E. G. Roehm, R. L. Morrissey, Nelson Caldwell, S. E. Bergstrom, E. Reiniger, S. R. Howells, R. E. Fields, Howard Pope, W. F. Stegner, Carl Mueller.

Cincinnati Lathe & Tool Co., Cincinnati. Booth 2W 18.
16-in. x 6-ft. Cincinnati geared-head lathe for tool room work; 24-in. x 10-ft. geared-head lathe, motor drive, with square turret attachment for severe duty work. Represented by: W. C. Heindel, W. J. Anderson, E. C. Cummings, K. I. Clisby, A. C. Meier, George Doll, William Fisgus.

Cincinnati Milling Machine Co., Cincinnati. Booth 2C 7.
Plain hydromatic miller; Duplex hydromatic miller; No. 3 Universal miller; No. 3 plain miller; Cincinnati cutter grinder; Cincinnati No. 2 centerless valve tappet grinder; No. 2 centerless piston pin grinder; No. 4 centerless bearing race grinder; 14 x 48 plain cylindrical grinder. Represented by: F. A. Geier, F. V. Geier, P. O. Geier, W. W. Tangeman, F. B. Heitkamp, R. E. W. Harrison, G. W. Binns, J. E. Caster, L. Nenninger, Hans Ernst, M. R. Romaine, E. G. Roehm, R. L. Morrissey, Nelson Caldwell, S. E. Bergstrom, E. Reiniger, S. R. Howells, R. E. Fields, Howard Pope, W. F. Stegner, Carl Mueller.

Cincinnati Shaper Co., Cincinnati. Booth 2W 17.
16-in. heavy-duty Cincinnati rapid traverse shaper equipped with universal table; 24-in. heavy-duty Cincinnati rapid traverse shaper; Cincinnati gear burnisher; shaper parts and assemblies. Represented by: H. S. Robinson, R. T. Hazelton, T. H. Schebrat, M. A. Spraley, George Diehl, Frank T. Goetz, F. G. Swain.

Cleveland Automatic Machine Co., 2269 Ashland Road, Cleveland. Booth 2C 5.
½-in. model M five spindle bar machine with independent feed control for all tools; ⅞-in. model M four spindle multiple drilling, forming and cut-off machine, blanking four nuts simultaneously from the bar; 7-in. model M five spindle chucking machine for castings, forgings or stampings. Represented by: A. L. Garford, president; H. W. Rupples, general manager; H. M. Rich, secretary-treasurer; C. W. Cowdrey, sales department; Herbert E. Nunn, B. C. Young, A. W. Schafer, W. Steinbrenner, G. W. Samstag, Arthur Jackson.

Cleveland Hobbing Machine Co., 1170 East 152nd Street, Cleveland. Booth 1A 10a.
Eight spindle rotary hobbing machine. Represented by: C. W. Blossom, president; W. H. Staples, vice-president and general manager; F. H. Adams, vice-president.

Cleveland Planer Co., 3148 Superior Avenue, Cleveland. Booth 1C 3.
Cleveland open side planers. Represented by: E. L. Essley, president; E. P. Essley, secretary; L. H. Mesker, sales manager; J. Jenne, works manager.

Cleveland Twist Drill Co., 1242 East Forty-ninth Street, Cleveland. Booth 4W 11.
Drills; reamers. Represented by: W. E. Caldwell, H. P. Jenson, J. B. Dillard, T. M. Skove, D. D. Burdett, H. J. Baier, R. G. Berrington, H. G. Smith, F. M. Hoelzle, A. J. Ireland, O. B. Hansen, R. D. Boltey.

Cochrane-Bly Co., Rochester, N. Y. Booth 2C 12.
No. 66 metal sawing machine with hydraulic feed and air clamp; No. 55 metal sawing machine with air clamp and multiple cutting fixtures; No. 21 automatic high-speed saw with power stock feed; No. 2 filing machine; No. 11 saw sharpening machine; No. 14 duplex shaper-miller. Represented by: W. H. Welch, vice-president; T. M. Crandall, secretary-treasurer; Bracket Clark.

Colonial Tool Co., 8432 Butler Ave., Detroit, Mich. Booth 5A 4.
Michigan Tool Co. milling cutters, hobs, gear-shaper cutters, special tools; Colonial Tool Co. round, spline, and combination round-and-spline broaches; spline gages. Represented by: Otto Lundell, president and general manager, Michigan Tool Co.; O. L. Bard, secretary, Michigan Tool Co.; J. W. Mull, Jr., sales manager, Michigan Tool Co.; C. J. Halborg, general manager, Colonial Tool Co.; E. H. Kurtz, sales manager, Colonial Tool Co.

Columbia Machine Tool Co., Hamilton, Ohio. Booth 2W 15.
Columbia 24-in. superior heavy-duty back geared crank shaper with speed box, friction clutch and brake and constant speed motor drive; vertical chucking machine of complete new design. Represented by: F. B. Yingling, E. S. Rich, F. Fiesselmann, O. G. Tweddell.

Conradson Tool Corporation, 2116 Indiana Avenue, Chicago. Booth 4A 3.
Shell reamers; expansion reamers; arbors; milling cutters. Represented by: W. J. Denning, Stephen Carboy, F. J. McHugh.

Consolidated Machine Tool Corporation of America, Rochester, N. Y. Booth 2C 4.
Heavy-duty boring mill; cold saw; milling machine; small tools for threading. Represented by: A. H. Ingle, Alfred Trosch, W. C. Ingle, H. M. Bowman, R. R. Roberts, W. J. Forward, H. A. Merrill, R. S. Laird, A. Myers, L. T. Jefferis, C. E. McArthur, C. R. Williams, S. A. Harding, P. I. Johnston, G. C. Bailey.

Covel-Hanchett Co., Big Rapids, Mich. Booth 2A 9.
Two-spindle horizontal grinding machine; face grinding machine, 20-in. wheel; large size double-spindle machine with special fixtures; combination face grinding and locomotive guide bar grinder; vertical spindle machine; automatic surface grinder; universal cutter and tool grinder; small size surface grinder; twist drill grinders; small size metal saw sharpening machine; large size metal saw sharpening machine. Represented by: E. B. Gardner, A. M. Johnson, W. S. Paden, Ed. Ellefson, L. H. Benjamin.

Cushman Chuck Co., Hartford, Conn. Booth 5B 2.
Collet chucks; dust-proof chucks; new pattern lathe chucks; boring mill jaws. Represented by: Harry E. Sloan, president; Harry W. Hultgren, sales department; James Jordan, superintendent; George Highberg, assistant superintendent.

Cutler-Hammer, Inc., Milwaukee. Booth 6A 1.
A. c. and d. c. automatic motor control; planer control; a. c. and d. c. manual motor control; Across-the-line "X" automatic starters; safety switches; push buttons; accessories. Represented by: A. G. Pierce, Cleveland district manager; F. U. Webster, advertising manager.

D

Danly Machine Specialties, Inc., 2104 South Fifty-second Street, Chicago. Booth 4B 6.
Die makers' supplies: die sets; guide posts; guide bushings; dowel pins; automatic gages; die springs; shoulder screws; socket head cap and set screws. Represented by: R. C. Danly, president; R. H. Danly, vice-president and general manager; J. R. Fitzsimons, manager Cleveland branch; A. L. Miller, manager Long Island City branch; George T. Danly, chief engineer; W. L. Rankin, manager Detroit branch; A. F. Wallace, manager Rochester branch.

DeVlieg Machine Tool Co., Jackson, Mich. Booth 2A 2.
High-powered precision simplified production type milling machine. Represented by: Charles B. DeVlieg, president and general manager; N. S. Lundberg, chief engineer.

DeWalt Products Corporation, Leola, Pa. Booth 6B 5.
DeWalt Wonder Metal Worker for cutting steel tubing; DeWalt Wonder Worker, a combination woodworker; DeWalt jointer; DeWalt mortiser. Represented by: Paul Gardner, president; Robert H. Mulch, general sales manager; Walter Knapp, engineer; L. J. McLaughlin.

Diamond Machine Co., Providence, R. I. Booth 2A 8.
Diamond face grinding machine; Type H surface grinding machine, universal head; continuous grinding machine. Represented by: D. K. Bartlett, A. A. Wood, L. L. Lorey, Morris Slepkow, G. W. Clausson.

Henry Disston & Sons, Inc., Philadelphia. Booth 4B 8.
Metal cutting saws, files and tool steel; a fast running cut-off machine in operation; band saw machine in operation; hack saw machine in operation. Represented by: S. Horace Disston, vice-president; George Satterthwaite, vice-president; H. A. Baxter, general sales manager for steel and metal cutting saws; J. C. Forrest, sales manager for metal saws; Charles Thompson, experimental engineer; H. Allen, chief metallurgist; Normal Bye, chief engineer.

Dreses Machine Tool Co., Cincinnati, Ohio. Booth 2W 12.
3-ft. 11-in. column Multi-duty radial drill. Represented by: C. E. Gilbert, J. Wiebell, superintendent; J. Disser, chief engineer; A. Schlachta, demonstrator.

E

Eastern Machine Screw Corporation, New Haven, Conn. Booth 1W 3.
"H & G" self-opening die heads; high-speed hob chasers; "H & G" threading machine, chaser grinder and feed pushers. Represented by: C. W. Bettcher, sales manager and secretary; O. H. Hoelzel, A. E. Chadwick, H. F. Wieler, B. DePolo, G. E. Mager, J. E. Jennings, F. J. O'Rourke, A. Jackson, J. C. Fletcher, Victor Larson, H. Dobson.

Eclipse Interchangeable Counterbore Co., Detroit. Booth 5B 4.
Counterbores; countersinks; core drills; multi-diameter cutters and special production tools for automotive and airplane motor manufacturers; operating demonstration of production tools. Represented by: R. G. Michell, general manager; A. C. Warn, assistant general manager; J. H. Smith, sales manager; U. G. Thomas, factory superintendent; L. N. Hall, Cleveland district manager; O. W. Dawson, G. Sealander and C. M. Bigger, sales representatives.

Economy Engineering Co., Willoughby, Ohio. Booth 1W 15.
¾-in. Economy automatic shaving machine, type S; ⅜-in. combined automatic pointing and threading machine; ¾-in. four-spindle semi-automatic threading machine. Represented by: F. O. Andrews, president; F. S. Andrews, assistant president; Louis Steinfurth, chief engineer.

Elwell-Parker Electric Co., 4205 St. Clair Avenue, Cleveland. Booth 6B 1 & 2.
Electric industrial trucks; electric tiering trucks; new Swiss model electric lift trucks; portable electric cranes. Represented by: J. P. Lyons, C. B. Cook, R. F. Crawford.

Ex-Cell-O Aircraft & Tool Corporation, 1200 Oakman Boulevard, Detroit. Booth 5A 9.
Tool steel drill jig bushings; internal grinding spindles; Diesel fuel pump parts; tool detail parts; aircraft engine precision parts. Represented by: N. A. Woodworth, president and general manager; W. F. Wise, sales manager; J. E. Wells, J. F. Hanlon, H. E. Henry.

F

Fafnir Bearing Co., New Britain, Conn. Booth 5W 10.
Line of ball bearings. Represented by: E. R. Carter, H. R. Reynolds, E. B. Hand, W. L. Rager.

Fairbanks, Morse & Co., 900 South Wabash Avenue, Chicago. Booth 5C 9
Sectionalized 25 H. P. squirrel-cage motor; sectionalized clean-air-jacket motor; clean-air-jacketed ball-bearing motor in operation; direct-current ball-bearing motor, a range of various sizes of ball-bearing motors. Represented by: K. W. Jones, J. R. Kindig, H. C. White, J. R. Patterson, Glen H. Corlette, G. J. Podlesak, C. E. McLaughlin, F. M. Gardner, R. L. Johnson.

Farrell-Birmingham Co., Inc., 344 Vulcan Street, Buffalo. Booth 3W 5.
No. 2-A Sykes gear generator; No. 1-A Sykes gear generator; one-tooth pinion stand; gear box of selective type with 40 deg. angle Sykes herringbone gears constantly in mesh; range of Sykes gear tooth comparators. Represented by A. G. Kessler, W. E. Sykes, Austin Kuhns, T. Holloway, H. E. Kitchen, J. Leahy, Paul Manager, John Brandt.

Fellows Gear Shaper Co., Springfield, Vt. Booth 2B 8.
Machines for cutting gears for four-speed transmission gear boxes, including No. 712 high-speed gear shapers for roughing and No. 77 side trimming high-speed gear shaper for finishing; No. 7A drop apron high-speed gear shaper; No. 7A standard high-speed gear shaper for cutting steel gear blanks having a 2-in. face; No. 75 high-speed gear shaper for cutting helical gears; a high-speed gear shaper with a kickoff and reversing attachment for cutting segment gears for a cash register; No. 612A gear shaper for cutting steel gear blanks of 5-in. face width; a thread generator in operation "Red Liner" automatic gear inspection machines; an involute testing machine for inspecting gear shaper cutters. Represented by: E. R. Fellows, president and general manager; E. J. Fullam, secretary and treasurer; R. M. Fellows, purchasing agent; W. F. Slomer, general sales manager; E. W. Miller, chief engineer; E. Stubbs, factory manager; C. C. Bankes, J. B. Strong, C. J. Nagel, F. P. McGrath; Douglas T. Hamilton, advertising manager.

Flather Co., Nashua, N. H. Booth 1W 4.
20 in. x 10 ft. motor driven geared head engine lathe. Represented by: H. L. Flather, president and treasurer; J. H. Flather, vice-president; H. H. Flather, assistant treasurer; J. H. Connor, superintendent.

Foley Mfg. Co., Inc., 11 North East Main Street, Minneapolis, Minn. Booth 6B 3.
Foley automatic saw filers; automatic hack saw grinders;

circular saw grinders; hand saw retoothers; automatic saw setting equipment. Represented by: W. M. Ringer, president; W. F. Rehbock, sales manager; C. H. Carlson, director of production; F. E. Collier, superintendent; G. O. Steen, service manager; W. P. Tobey, Jr., New England sales representative.

Foote-Burt Co., 13000 St. Clair Avenue, Cleveland. Booth 1A 12.
No. 1 surface broaching machine; No. 15½-F six-spindle drilling machine; No. 16 hydraulic feed drilling machine; No. 15½-D drilling machine; No. 22½ high duty drilling machine; BW-23 two-spindle sensitive drilling machine; No. 1¼ two-spindle sensitive drilling machine; DE-1 single-spindle sensitive drilling machine; No. 4½ independent feed drilling machine. Represented by: G. E. Randles, president; T. H. Doan, Jr., vice-president; R. E. Delamater, Ira D. Grove; W. F. Babcock, Detroit representative; David F. Noble, Chicago representative; Herbert Kennedy, Eastern representative.

Fosdick Machine Tool Co., Cincinnati. Booth 1A 3.
No. 2 two spindle sensitive drill, 13 in.; No. 4 two spindle sensitive drill, 24 in.; No. 5 three spindle sensitive drill, 16 in.; 6 ft. 19 in. column Economax radial drill. Represented by: N. B. Chace, William C. DeRoo, A. Kuehn.

Foster Machine Co., Elkhart, Ind. Booth 2C 2.
No. 5 all geared head universal turret lathe; 1-F turret type Fastermatic; 3-F platen type Fastermatic; 3-F turret type Fastermatic; 4-F platen type Fastermatic. Represented by: W. H. Foster, president; H. A. Moore, general sales manager; Carl Moser, Jr., Harry Lyon, O. B. Clemens.

Fredericksen Co., Saginaw, Mich. Booth 5W 6.
Spindle bearings; lead screw nuts; miscellaneous machine tool bearings and bushings of Sabeco bearing metal; worm gear castings. Represented by: Arthur A. Schupp, general manager; Henry C. Limbach, sales manager; C. D. Proctor, Ralph H. Sherry, Karl A. Agricola; William L. Agricola, superintendent.

Frew Machine Co., 124 West Venango Street, Philadelphia. Booth 3W 16.
No. 1 automatic tapper; No. 4 hand milling machine; No. 0 Duplex drill; No. 2 automatic tapper. Represented by: George H. Frew, H. Edwards.

G

Gairing Tool Co., Detroit. Booth 4B 2.
Small tools; swing tool boring and facing heads; full floating holders; quick-change floating tap holders; multiple boring and facing cutters; multiple operation core drilling, counterboring and chamfering tools, inserted blade and solid type; Gairing nose drive reamers, inserted blade and solid; inserted blade hollow mills; inverted counterbores; standard counterbore sets for tool room machine shop use; chucking reamers; off-set spot facing heads; grinding fixtures. Standard type A, B and C counterbores and core drills, multiple operation cutters, Gairing full floating holders and nose drive reamers in operation. Represented by: E. Gairing, president; C. E. Wyrick, general manager; B. O'Meara, assistant manager of sales; D. G. Hawksworth, assistant chief engineer; William B. McClellan.

Gallmeyer & Livingston Co., Grand Rapids, Mich. Booth 2B 15.
Grand Rapids hydraulic feed surface grinders, hand feed surface grinders, universal cutter and tool grinders, twist drill grinders, tap grinders, combination twist drill and tap grinders. Represented by: C. H. Gallmeyer, treasurer; S. Owen Livingston, vice-president; B. C. Saunders, secretary; J. DeKoning, engineer.

Gardner Machine Co., Beloit, Wis. Booth 1W 20.
No. 9 40 in. super disk grinder in operation, grinding coils springs; No. 84 special automatic hexagon nut grinder in operation, grinding hex nuts; No. 86, 30 in. horizontal grinder with hand operated swinging work table; No. 3-CB Speed-U-Need polishing lathe; No. 3-DA double spindle Speed-U-Need polishing lathe. Represented by: L. W. Thompson, president; F. E. Gardner, vice-president; W. B. Leishman, treasurer and sales manager; B. H. Pratt, superintendent of service; F. M. Risler, Detroit manager; Harold Prigoff, Eastern manager; H. J. Gaumond, P. L. Watson, W. L. Townsend, H. C. Steinbuck and A. B. Davenport, Jr., sales engineers.

Gaterman Mfg. Co., W., Manitowoc, Wis. Booth 5C 2a.
Pneumatic oscillating tapping machines. Represented by: W. Gaterman, president; E. Gaterman, secretary and treasurer; F. H. Kind, master mechanic.

Gears & Forgings, Inc., 3010 Woodhill Road, Cleveland. Booth 3W 15.
Gears; forgings; reduction units; machine tool parts; transmissions. Represented by: R. B. Tripp, general sales manager; R. K. Plummer, assistant sales manager; C. E. Broome, district sales manager; H. J. Awig, engineer.

General Electric Co., Schenectady, N. Y. Booth 4A 2.
Motors and control applicable to machine tools.

General Radial Drilling Machine Co., 1767 Elmore Street, Cincinnati. Booth 2W 14.
5 ft. 15 in. column hydraulic radial drill; 3 ft. 9 in. column sensitive radial drill. Represented by: R. B. Busch, president; J. Schaffner, chief engineer.

Geometric Tool Co., New Haven, Conn. Booth 1W 21.
Self opening die heads; style D for hand machines; KH for hand machines; DS for Brown & Sharpe automatics; KD rotary heads for live spindles; special purpose tools; collapsing taps receding chaser taps; solid adjustable die heads; solid adjustable taps; threading machines; chaser grinder; chaser grinding fixture. Represented by: James W. Sneyd, vice-president; G. A. Denison, sales manager; P. A. Pritchard, sales engineer; L. G. Spealman, production engineer.

Giddings & Lewis Machine Tool Co., Fond du Lac, Wis. Booth 2C 11.
No. 50 extra heavy table type high pressure power precision horizontal boring, drilling and milling machine. Represented by: C. Gebuhr, R. H. McCormick, A. E. Ulrich, A. L. Carlson, E. E. Wagner.

Gisholt Machine Co., Madison, Wis. Booth 1C 4.
Turret lathes; automatic chucking machines; balancing machines; tool grinder. Represented by: W. J. Hannum, George M. Class, F. M. Long, L. E. Godfriaux, W. I. Senger, C. B. Carr, G. E. Thomas, R. D. Heflin, H. G. Hall, R. E. MacCartney, J. H. Nebel, A. S. Beckman, U. S. James.

Gits Bros. Mfg. Co., Chicago. Booth 5A 8.
Oil cups; oil hole covers; sight feed lubricators; high pressure grease cups; multiple feed oilers; high pressure grease gun and fittings. Represented by: R. J. Gits, president; Frank Zeman, sales manager; J. A. Gits, general superintendent.

Gleason Works, Rochester, N. Y. Booth 1B 4.
3 in. spiral bevel gear generator; 10 in. manufacturing spiral bevel gear generator; 15 in. spiral bevel gear generator; 30 in. spiral bevel and hypoid generator; 4 in. spiral bevel cutter sharpener; 12 in. spiral bevel cutter sharpener; cutter angle testing device; 3 in. straight bevel gear generator; Universal manufacturing bevel gear generator; 12 in. straight bevel gear generator; generator tool grinder; four spindle manufacturing rougher; multiple spindle rougher cutter sharpener; 18 in. combination testing and lapping machine. Represented by: A. L. Stewart, chief engineer; S. H. Earl, works manager; B. H. Bickle, sales manager; F. E. McMullen, chief engineer, gear division.

Goddard & Goddard, Inc., Detroit. Booth 3W 13.
Milling cutters, including special and standard classes in both form and profile type; demonstration of cutting in alloy steel. Represented by: A. N. Goddard, president; E. E. Anderson, works manager; C. S. Goddard, sales manager; William Fritz, superintendent; K. W. Legg and C. H. Wallace, sales engineers; E. E. Guntert, J. Murray, Henry Boggis, E. D. Rummins and Frank Willbrant.

Goss & De Leeuw Machine Co., New Britain, Conn. Booth 1B 3.
6 in. and 11 in. G & DL tool revolving multiple spindle automatic chucking machine; No. 6 work revolving multiple spindle automatic chucking machine. Represented by: Stanley T. Goss, president; Val. C. Hart and J. J. Spring, sales engineers; H. J. Hauck, engineer.

Gould & Eberhardt, Newark, N. J. Booth 1B 6.
No. 9H universal manufacturing gear hobbing machine; 12HS manufacturing gear hobbing machine; 48HS manufacturing gear hobbing machine; 24 in. manufacturing shaper with universal table; 36 in. manufacturing shaper. Represented by: F. L. Eberhardt, president and general manager; H. Ezra Eberhardt, secretary; William F. Zimmerman, chief engineer; Gustave Spies, sales engineer; F. G. Eberhardt, John Duffy, John Allwood, James Craig and Albert Miller, sales representatives.

Greenfield Tap & Die Corporation, Greenfield, Mass. Booth 3W 9.
No. 12 Greenfield high speed internal grinder; No. 1 hydraulic plain grinder; No. 3 motor-in-head cutter and reamer grinder; No. 734 threading machine with automatic opening die head; snap, plain and thread gages; acorn and button dies; ground and cut thread taps; twist drills; screw slotting cutters; reamers; pipe tools. Represented by: W. B. duMont, vice-president in charge of sales; R. B. Hubbell, manager, machine tool department; E. J. Bryant, manager, gage and reamer department; Louis Battey, manager, small tool department; A. M. Drake, chief engineer; F. Judge, general superintendent; C. C. Ziegler, C. H. Coe, B. G. Munyan, A. T. Ritchie, J. K. Penny, A. J. Kiehne, B. F. Butterfield and G. W. Demarest.

Greenlee Brothers & Co., Rockford, Ill. Booth 1B 2.
Four spindle automatic screw machine; multiple spindle

CARNEGIE LIBRARY OF ATLANTA

drilling machine. Represented by: G. C. Purdy, president; J. H. Mansfield, chief engineer; A. H. Eggers, sales manager; L. H. Geddes, F. J. Hollem, J. C. Beers.

Gurney Ball Bearing Division, Marlin-Rockwell Corporation, Jamestown, N. Y. Booth 4W 14.
Radial, radio-thrust and thrust ball bearings; head stocks, a valve grinder, vertical electric motors and a reduction unit, all equipped with Gurney ball bearings. Represented by: H. A. Johnston, sales manager; Coleman Darnell, assistant sales manager; A. A. McGowen, advertising manager; O. H. Koelker, D. K. Hatch, sales representatives.

H

Hall Planetary Co., Fox Street and Abbotsford Avenue, Philadelphia. Booth 2W 11.
Type B Planetary full automatic; type A Planetary illustrating various types of threads and bores; type D Planetary in production as internal milling; machinabilameter—a new instrument for testing the machineability of metals. Represented by: P. Hall, G. Stafford, H. C. Sheaffer, H. Leisner.

Hammond Mfg. Co., 7808 Kinsman Road, Cleveland. Booth 5A 2.
Radial drilling and tapping machine; pedestal automatic tapping machine; cabinet base polishing and buffing machine; six spindle hydraulic drilling machine. Represented by: William D. Buss, J. J. Stephens, C. M. Allen, Glenn M. Hood.

Hanna Engineering Works, 1765 Elston Avenue, Chicago. Booth 3W 10.
Hanna rapid riveter—capacity ¼ in. rivets cold; Hanna yoke riveter—capacity ⅝ in. rivets cold; Hanna closed yoke riveter for automobile chassis frame riveting; Hanna turret riveter for automobile chassis frame riveting. Represented by: A. F. Jensen, president; J. C. Hanna, chief engineer; L. F. Weldon, O. F. Weiss, G. B. Lytle and E. J. Charron, sales representatives.

Hannifin Mfg. Co., 621 South Kolmar Avenue, Chicago. Booth 5B 9.
Air operated chucks; air operated arbor presses; air operated rivet presses; air operated work holding fixtures; air operated vises; air control valves; air pressure regulating valves; air operated expanding mandrels; air clutch countershafts; stationary double-acting air cylinders; hydropneumatic broaching presses; boring bars; air-operated devices. Represented by: V. W. Peterson, president; J. H. Sipson, assistant general manager; R. A. Bean, H. H. Mercer and E. D. Thompson, sales engineers.

Hanson-Whitney Machine Co., Hartford, Conn. Booth 2B 6.
Universal semi-automatic thread milling machine; universal vertical tool and die shaping machine; rapid precision centering machine; taps, gages, hobs and screws, finished after hardening by the Hanson process. Represented by: J. W. Johnson, C. A. Lauridsen, H. C. Chellman; E. A. Hanson, president; L. B. Reed, general manager; George McPherson, A. G. Brice, H. B. Morrison, E. H. Huntington.

Hardinge Brothers, Inc., Chicago. Booth 2W 7.
Bench lathes and attachments; bench millers; quick-change precision lathe. Represented by: J. F. Griswold, president; Henri E. Nelson, general manager, machine tool division; Henry C. Sharp, director of engineering; Edward A. Iverson, representative.

Heald Machine Co., 10 New Bond Street, Worcester, Mass. Booth 2A 7.
No. 72A-3 Size-Matic internal grinding machine; No. 72A-3 Gage-Matic internal grinding machine; No. 72A-5 airplane cylinder grinding machine; No. 25A rotary surface grinder with 30 in. chuck. Represented by: J. N. Heald, Richard A. Heald, Roger N. Heald, S. T. Massey, W. Guild, R. A. St. John, J. R. Carlson.

Hendey Machine Co., Torrington, Conn. Booth 1D 2.
12 in. x 5 ft. high-speed ball bearing lathe; 12 in. x 5 ft. geared head lathe, taper attachment, oil pan, No. 3 drawing-in attachment; 18 in. x 10 ft. geared head lathe, ball bearing spindle, taper attachment, sub headstock; 16 in. heavy-duty crank shaper; 32 in. heavy-duty crank shaper; No. 12 hydraulic broaching machine. Represented by: S. H. Childs, vice-president and general manager; W. A. Reynolds, assistant to vice-president; A. H. Hall, sales manager; P. H. Buxton, superintendent; C. Bouillon, George Knight, H. Blakeslee and R. J. Peterick, assistant superintendents; W. F. Henly, New York branch manager; F. C. Parman, Rochester branch manager; E. B. Barker, Detroit branch manager; P. W. Rice, Chicago branch manager; R. B. Shaw, Dayton branch manager; F. J. McCarty, special representative.

Henry & Wright Mfg. Co., Hartford, Conn. Booth 2W 4.
Henry & Wright dieing machines (high-speed automatic punch presses); multiple station progressive dies; high-speed multiple spindle sensitive drilling machines. Represented by: J. F. Funk, general manager; C. F. Sherman, chief engineer; J. J. Dale, Western sales manager; R. B. Weeks, C. H. Hamilton, F. H. Spiegel, W. J. Henry.

Higley Machine Co., South Norwalk, Conn. Booth 2W 9.
Higley 8 in. capacity Coldcut sawing machine equipped with screw feed table for feeding heavy bars up to cutting position and swivel type front table with gage stop to handle pieces being cut off and to gage length of pieces. Represented by: L. M. Waite, general manager; I. S. Smith, sales manager; M. H. Waite, service manager.

Hill-Curtis Co., Kalamazoo, Mich. Booth 2W 8.
Electric grinders, bench and pedestal type; belted grinders, bench and pedestal type; electrically driven railroad journal wedge reclaimer; selective speed tool and productive grinders, electric; Rite Speed electric polishing lathe; belted polishing lathe; disk grinders, electric. Represented by: W. C. Hammond, president; W. J. Holtmeier, sales manager; H. J. Kingsbury, chief engineer.

Hisey-Wolf Machine Co., Cincinnati. Booth 2W 22.
Electric drills, grinders, buffers. Represented by: John W. Friedlander, J. E. Hauser, Roy D. Haworth, C. J. Henefelt, Albert Kiefer, George Moerlein, P. A. Rebok, E. Ritz, Jr., T. R. Sanders, H. W. Wallace.

Hoefer Mfg. Co., Freeport, Ill. Booth 2W 1.
5-7½ h.p. production drillers; auxiliary heads. Represented by: Chester A. Hoefer, secretary; Paul Andree, general manager; Ernest Kracht.

E. F. Houghton & Co., Philadelphia. Booth 6B 4.
Microstructure of steels after Society of Automotive Engineers' recommended heat treatment; Houghtoclean for metal cleaning; Hocut for metal cutting; Vim leather belting and leather packings; lubricating oils.

Hyatt Roller Bearing Co., Newark, N. J. Booth 5A 5.
Hyatt bearings for machine tool application; photographic illustration of bearing applications to machine tools ranging from board drop hammers to finishing tools of every kind. Represented by: F. S. Darke, L. L. Hill, W. T. Long, L. F. Stuebe, sales engineers; C. L. Newby, manager, industrial division, Chicago; J. M. Kelly, manager, Pittsburgh sales district; H. M. Carroll, advertising manager.

Hydraulic Press Mfg. Co., Columbus, Ohio. Booth 3W 4.
H-P-M hydro-power press; H.P.M. hi-speed Hydraulic shop press. Represented by: F. B. MacMillin, H. F. MacMillin, P. A. Harlamert, W. Ernst.

I

Illinois Tool Works, 2501 North Keeler Avenue, Chicago. Booth 5C 1.
Milling cutters; hobs; reamers; broaches; ground form tools; die filing machines; tool testing fixtures, Wedgelock tool holders. Represented by: S. O. Bjornberg, P. J. Nelson, A. W. Swanson.

Ingersoll Milling Machine Co., Rockford, Ill. Booth 1C 1.
Ingersoll 4-head adjustable rail heavy pattern milling machine openside milling, boring and drilling machine; face milling cutter grinder; line of Ingersoll standard and special milling cutters. Represented by: Amos A. Braid, Robert M. Gaylord, W. C. Sproul, J. R. Johnson, A. H. Lyon, E. K. Morgan, H. C. Rose, F. J. Malone, J. M. B. Scheele, W. M. Grove, J. M. Macrae, G. L. Bradley, S. W. Fish, Walter Hangartner, Parnell Divine.

International Machine Tool Co., Indianapolis. Booth 1W 16.
1-H 24 x 5¼ in. Libby-International turret lathe with power feed cross slide turret; 3-H 29 x 8¼ in. Libby-International turret lathe with rigid turret. Represented by: O. B. Iles, T. P. Dickinson, Harry Heidergott, Alfred Ruwe.

THE IRON AGE. Booth 5W 6a.
Represented by: F. J. Frank, president; C. S. Baur, general advertising manager; Emerson Findley, Central Western representative; B. L. Herman, western N. Y. State representative; Peirce Lewis, Detroit and Cincinnati representative; C. H. Ober, New York representative; W. B. Robinson, Pittsburgh representative; W. C. Sweetser, New Jersey representative; D. C. Warren, New England representative; F. S. Wayne, Western representative; C. E. La Chaussee, St. Louis representative; H. E. Leonard, O. Johnson and B. H. Hayes, assistants to general advertising manager; W. W. Macon, managing editor; F. L. Prentiss, Cleveland editor; R. A. Fiske, Chicago editor; R. E. Miller and B. Finney, editorial staff; A. H. Dix, manager reader service department.

J

Jones & Lamson Machine Co., Springfield, Vt. Booth 1A 10.
Hartness automatic dies and chasers, screw thread comparator, Hartometer; Flanders ground thread taps; chaser

grinder. Represented by: R. E. Flanders, manager; H. S. Bael, assistant general manager; E. T. Bysshe, chief engineer, die division; E. F. Lockwood, H. G. Taylor, H. A. Trimble.

Jones & Lamson Machine Co., Springfield, Vt. Booth 2C 6.
2¼ x 24 Hartness flat turret lathe for bar work; 3 x 36 Hartness flat turret lathe for chucking work; 14 in. standard Fay automatic lathe for second operation on clutch gear; 14 in. standard Fay automatic lathe for finning operation on airplane cylinders; 14 x 50 in. Fay automatic lathe with center drive tooled to machine large truck rear axle in one operation; 24 x 42 in. Fay automatic lathes for machining large flange shaft. Represented by: R. E. Flanders, manager; H. S. Beal, assistant general manager; J. E. Lovely, chief engineer, Fay department; W. F. Howard, F. W. Dodge, C. A. Erskine, B. L. Billings, A. L. Currie, H. C. Miller, F. A. Parker, G. J. Keller, F. L. Watkins, A. V. Wiggins, J. C. Price, C. H. Seaver, J. C. Hebert, J. L. Reilly.

K

Kane & Roach, Inc., Syracuse, N. Y. Booth 3W 14.
Literature and motion picture display of Kane & Roach equipment. Represented by: W. E. Kane, president; R. C. P. Kane, vice-president; H. W. Kane, secretary; H. Wier, engineer.

Kearney & Trecker Corporation, Milwaukee. Booth 2B 7.
No. 2 standard universal Milwaukee milling machine; No. 2 rotary vertical Milwaukee milling machine with skip-stock rotary table; No. 1402 Mil-waukee-Mill Simplex; No. 2207 bridge type Mil-waukee-Mill. Represented by: Theodore Trecker, president; E. J. Kearney, secretary and treasurer; George L. Erwin, Jr., sales manager; M. J. Schmitt, assistant sales manager; C. M. Cheadle, Jr., advertising manager; C. R. Hochmuth, William K. Andrew.

Keller Mechanical Engineering Corporation, 70 Washington Street, Brooklyn. Booth 2C 3.
Type BL-2416 Keller full automatic tool room machine equipped with two-template rigging and attachment for locating and jig boring; No. R6 cutter and radius grinder; a Kellocater complete unit with over-arm and spindle equipped with power feed; Kellerflex flexible shaft machines including a 1 h.p. outfit. Represented by: J. F. Keller, president; Henry Schreiber, Charles Bitter, Paul Renno, W. L. MacRae, E. D. Ashley, Arthur Jenner.

Kelly Reamer Co., Cleveland, Ohio. Booth 5W 12-13.
Boring and reaming tools, including special production tools for boring and reaming and multiple cutting; turret lathe; drill press; horizontal boring mill; vertical turret lathe equipment for all types of work, particularly for cylinder crankcase and multiple cutting operations. Represented by: H. C. Putnam, president; E. W. Putnam, vice-president and general manager; D. E. Van Deusen, sales manager; A. H. Howard, sales engineer.

Kempsmith Mfg. Co., Milwaukee. Booth 1B 7.
Milling machines. Represented by: Robert J. Wilson, Frank Wollaeger, L. J. Radermacher, H. L. Livesay, Charles Watson, A. E. Nieman, Walter Mickelson, Hugo E. Czerwonky, R. F. Shaw.

Kent Machine Co., Cuyahoga Falls, Ohio. Booth 5A 1a.
Six spindle horizontal driller; double head countersinker; bar pointer; stud threader. Represented by: A. B. Babbitt, secretary and sales manager; A. F. Sinclair, factory manager.

Keystone Lubricating Co., Twenty-first and Clearfield Streets, Philadelphia. Booth 6A 2.
Keystone safety lubricators; Poneuma-Lectric lubricating system; grease cups; greases (solid, semi-solid cup greases, liquid greases for ring oil bearings). Represented by: H. A. Buzby, president; George W. Hall, Peter Cassady, C. O. Norstrum, Philip King, H. M. Ludwick, Vic Berguson, R. C. McDaniels, G. W. Quinn, M. C. Schwenk.

King Machine Tool Co., Cincinnati. Booth 1A 2.
Heavy duty vertical boring and turning mills. Represented by E. A. Muller, C. F. Muller, I. Herbst, H. Glensman.

Kingsbury Machine Tool Corporation, Keene, N. H. Booth 2W 10.
Automatic multi-spindle indexing machine for drilling, reaming and tapping with pneumatic synchronization of spindle stroke and index, automatic two spindle vertical drilling and burring machine; automatic three spindle dial feed tapping machine; type AC opposed spindle drilling and tapping machine; model 30 drilling head; model 30 T. tapping head. Represented by: E. J. Kingsbury, president and treasurer; G. Swahnberg, chief engineer; J. E. Anderson, factory manager; H. B. Jones and G. G. Hathaway, sales engineers.

W. B. Knight Machinery Co., St. Louis. Booth 1W 10.
No. 4 and No. 2 Knight millers; set of dial indicators mounted on No. 4 miller for jig boring; high speed, horizontal, shaping, circular milling and index attachments for use on either No. 4 or 2 millers. Represented by: H. E. Knight, vice-president; Robert Smith.

L

William Laidlaw, Inc., Belmont, N. Y. Booth 5B 3.
Type CM 30 in. metal cutting band saw; type JM 20 in. metal cutting band saw; type SM 20 in. metal cutting band saw. Represented by: William Laidlaw, president; E. O. Jenkins, sales manager.

Landis Machine Co., Waynesboro, Pa. Booth 1B 8.
¾ in. Landis automatic forming and threading machine; 6 in. Landis pipe threading and cutting-off machine, motor driven, Lanco heads for automatic, semi-automatic and hand operated threading machines; Landmatic heads for turret lathes and hand operated screw machines; Victor collapsible taps for internal threading; Victor receding chaser collapsible taps for internal threading; Victor adjustable taps. Represented by: C. N. Kirkpatrick, sales manager; G. M. Stickell, assistant sales manager; R. G. Mumma, manager, Victor plant; S. W. Mathias, engineer; J. T. Benchoff, M. B. Henneberger, J. I. Davis.

Landis Tool Co., Waynesboro, Pa. Booth 1W 18.
Hydraulic cam grinder; hydraulic oscillating grinder; plain hydraulic grinder; hydraulic crank grinder. Represented by: R. F. Ingram, sales manager; Paul Stoner, sales engineer; F. W. Pensinger, advertising manager; A. P. Steiner, chief engineer; C. M. Talhem, F. M. Gertiser and William Ibsen.

La Salle Tool Co., Ottawa, Ill. Booth 3W 12.
No. 824 full electric automatic surface grinder; No. 3 electric surface grinder; No. 1 electric plain and surface grinder. Represented by: F. S. Knowles, president; John C. Kopf, general manager.

R. K. LeBlond Machine Tool Co., Cincinnati. Booth 2C 1.
No. 12 LeBlond heavy duty automatic lathe, texrope motor drive; No. 16 heavy duty automatic lathe; texrope motor drive; 11 in. x 4 ft. rapid production lathe with facing attachment, pan, pump, belted motor drive; 25 in. x 12 ft. heavy duty geared head engine lathe with geared motor drive; 15 in. x 8 ft. heavy duty geared head tool room with relieving attachment, draw-in attachment, taper attachment, pan, pump and texrope motor drive; 16 in. x 5 ft. rapid production lathe with plain rests, rapid power traverse, pan, pump, belted motor drive; No. 1 cutter grinder complete with all attachments, with power feed to table, and completely motor driven. Represented by: H. C. Pierle, sales manager; William F. Groene, vice-president; B. N. Brockman, William E. Groene, C. C. Carr, Dave Mills; William E. Strauss, works manager; W. L. Rybolt, advertising manager.

Lees-Bradner Co., Cleveland. Booth 3W 1.
Thread millers and gear cutters. Represented by: E. J. Lees, H. C. Young, T. E. Lord, R. A. Zilm, C. H. Eden.

Lehmann Machine Co., 3560 Chouteau Avenue, St. Louis. Booth 2W 24.
Geared head, motor driven engine lathe; gear lapping machine. Represented by: Paul Lehmann, A. H. Lehmann.

Leland-Gifford Co., Worcester, Mass. Booth 2B 1.
12 in. one spindle belt and motor spindle sensitive drill; 14 in. two spindle belt and motor spindle sensitive drill; 24 in. two spindle belted spindle drill. Represented by: S. B. Dowd, sales manager; H. P. Sawtell, D. H. Boothby, C. H. James, E. D. Baldwin, E. A. Heidlinger, T. A. Poutter, W. E. Fors, E. F. McCaffery.

Lincoln Electric Co., Colt Road and Kirby Avenue, Cleveland. Booth 5A 3.
Electronic tornado automatic welder in action; stable arc welder in action; Linc-Weld motors and welders supplies, samples, etc. Represented by: A. F. Davis, vice-president; R. P. Tarbell, O. P. Hanchette, F. W. Kessler, R. B. Tuhey, Morris R. Taylor, E. H. Bergstrom.

Link-Belt Co., Indianapolis. Booth 4C 1.
Link-Belt silent, roller and malleable chains and sprocket wheels; automatic idler for use with Link-Belt silent chain drives applied to main and integral shaft of machine tools; Link-Belt Paradox showing detailed action of silent chain on wheels; herringbone speed reducer in operation showing complete anti-friction reducer and full herringbone gears. Represented by: J. S. Watson, vice-president; R. S. Dyson, special engineer; E. H. Smedley, sales engineer; F. H. Dalrymple, R. Wainright, H. R. Cunning, L. Spillan.

Lodge & Shipley Machine Tool Co., Cincinnati. Booth 2B 11.
New 14-in. x 6-ft. Selective head tool room lathe and other lathes. Represented by: J. W. Carrel, H. J. Breitenbach, T. C. Stephens, W. L. Dollo, L. E. Eberts, H. M. Kordenbrock, J. E. Kordenbrock.

Logansport Machine Co., Logansport, Ind. Booth 1W 9.
Air operated work holding devices, including air operated chucks; chucking devices; rotating and non-rotating cylinders; arbor presses; milling and drilling vises; control valves. Represented by: F. B. Wilkinson, president; Frank G. Payson, general manager; J. C. Cotner, sales engineer; Andrew Michael, assistant superintendent.

Lucas Machine Tool Co., 523 East Ninety-ninth Street, Cleveland. Booth 1W 17.
No. 42 horizontal boring, drilling and milling machine; No. 41 horizontal boring, drilling and milling machine with dial indicator indexing device; 30-ton Lucas power forcing press. Represented by: H. M. Lucas, president; G. A. Yost, secretary; J. A. Leighton, sales manager; F. P. Sprague, R. L. Glaser, R. G. Goring, L. Reulbach.

Ludlum Steel Co., Watervleit, N. Y. Booth 6A 4.
Steel and tungsten carbide; mill and fabricated forms; Enduro Nirosto steel; Nitralloy; tool steels; forgings; Strauss metal. Represented by: H. G. Batcheller and F. B. Lounsberry, vice-presidents; A. F. Dohn, sales manager; C. B. Templeton, assistant to president; H. A. DeFries, metallurgist; W. Westover, advertising manager; H. I. Askew, J. C. Gearhardt, H. Hardwicke, G. Peterson.

M

Madison-Kipp Corporation, Madison, Wis. Booth 5W 11.
Fresh oil systems automatic centralized lubrication devices; automatic die casting machine films. Represented by: A. T. Lilligren, sales manager; J. A. Coleman, vice-president; J. A. Courter, eastern sales manager; T. E. Coleman, president; W. G. Coles, chief engineer; T. C. Korsmo, chief engineer of die casting division.

Manning, Maxwell & Moore, Inc., Putnam Machine Works, Fitchburg, Mass. Booth 2B 5.
Putnam 72-in. rotary continuous milling machine and 36-in. type K rotary slitting machine. Represented by: F. H. Walsh, E. L. Fickett, R. G. Holmes, J. H. Welch, W. A. Deems, F. P. Scott, O. B. Schmeltz.

Marschke Mfg. Co., Indianapolis, Ind. Booth 4B 1.
Universal portable electric tools; high cycle portable electric tools; Marschke grinders and Marschke swing frame grinders. Represented by: W. C. Allen, R. D. Black, R. E. Mizener, G. M. Buchanan, A. M. York, Lee H. Hind, Gus Fischer, Ralph Herrick, J. A. Fairfield, Luke Boyd, W. J. Fenwick, W. T. Johnston, Guy J. Coffey, C. C. Watts, W. S. Talbott.

McCrosky Tool Corporation, Meadville, Pa. Booth 5W 14.
McCrosky super-adjustable reamers and reaming bars; boring heads; Wizard quick-change chucks and collets; friction-drive tapping collets; safety tap holders; McCrosky turret tool posts for lathes; self-centering steady-rests; "Neva-Stop" face plates; tungsten-carbide turning tools. Represented by: F. P. Miller, president; R. W. Thomas, general manager; C. M. Sutton, sales manager; Frank Walster, shop superintendent; S. P. Miller, treasurer; Louis Skeel, engineer; W. J. Greenleaf, I. F. Belknap, A. J. Moore, Fred Fisher, I. C. Cameron, Arthur Fell, Frank Findlay.

Michigan Tool Co., 147 Joseph Campau Avenue, Detroit. Booth 5A 4.
Michigan Tool Co. milling cutters, hobs, gear shaper cutters, special tools; Colonial Tool Co. round, spline, and combination round-and-spline broaches; spline gages. Represented by: Otto Lundell, president and general manager; Michigan Tool Co.; O. L. Bard, secretary, Michigan Tool Co.; J. W. Mull, Jr., sales manager, Michigan Tool Co.; C. J. Halborg, general manager, Colonial Tool Co.; E. H. Kurtz, sales manager, Colonial Tool Co.

Modern Machine Tool Co., Jackson, Mich. Booth 5B 6.
Combination drill table and vise as applied to standard drill presses, electric drill presses and radial drills. Represented by: H. G. Walker, manager.

Moline Tool Co., Moline, Ill. Booth 2C 9.
No. 115-D hydraulic feed driller equipped with twelve standard BV type heads; No. 114-U driller equipped with 12 universal joint heads. Represented by: Wilson P. Hunt, C. R. Rosborough, Franklin Johnston, A. E. Lindberg, O. R. Reller, Willis C. Kuschmann, S. L. Brandenburg, R. H. Brandenburg, Louis Hallene, C. W. Hallene, C. E. Parkhurst, A. L. Sackett, Floyd Brown.

Monarch Machine Tool Co., Sidney, Ohio. Booth 2W 21.
16 in. x 6 ft. Monarch Model AA heavy-duty helical geared Timkenized high-speed lathe; 16 in. x 30 in. model C 16-speed helical geared completely Timkenized tool room lathe with full equipment; 24 in. x 10 ft. model N 16-speed extra heavy-duty helical geared Timkenized lathe; hydraulic automatic lathe. Represented by: W. E. Whipp, vice-president and general manager; F. C. Dull, secretary and assistant general manager; P. A. Abe, general superintendent; C. A. Bickel, chief engineer; C. L. Cameron, J. W. Dunn, Stanley Brandenburg.

Morse Chain Co., Ithaca, N. Y. Booth 5W 10a.
Morse silent chain drive; flexible couplings; speed reducer; device showing action of rocker joint; methods of lubrication. Represented by: A. B. Wray, sales manager; D. B. Perry, works manager; R. L. Phillips, R. J. Koch.

Morton Mfg. Co., Muskegon Heights, Mich. Booth 3W 19.
Morton 48 in. stroke high-duty draw-cut shaper with variable speed transmission; 18 in. stationary keyway cutter with direct connected reversing drive unit; Hi-pro keys; Robinson air hose couplings. Represented by: Henry E. Morton, president; G. F. Goble, mechanical engineer; F. Frank Bliss, H. Earl Morton, general superintendent; M. H. Morton, assistant to president.

Murchey Machine & Tool Co., 951 Porter Street, Detroit. Booth 2W 23.
Collapsible taps; self-opening die heads. Represented by: W. C. Beechner, sales manager; P. F. Zerkle, J. H. Coyle.

N

National Acme Co., Cleveland. Booth 1B 5.
4 in. Gridley automatic four spindle chucking machine; 1¼ in. Gridley automatic four spindle bar machine; 9/16 in. Acme automatic five spindle bar machine; centrifugal oil clarifying and separating machine; self-opening dies; collapsing taps. Represented by: A. E. Drissner, chief engineer; A. E. Henn, manager, machinery sales department; H. F. Fussner, manager, die and tap sales department; A. O. Bredemere, W. A. Johnson, R. J. Preston, W. G. Furlong, E. C. Lange.

National Automatic Tool Co., Richmond, Ind. Booth 1D 1.
Multiple spindle way driller; multiple spindle way tapper; vertical hydraulic single spindle heavy-duty driller; vertical hydraulic multiple adjustable spindle driller; vertical single spindle Hi-duty gear feed driller; small multiple spindle driller; universal joints. Represented by: H. W. Bockhoff, president; H. C. Hunt, secretary; E. D. Frank, sales manager; E. A. Herrcke, assistant sales manager; R. M. Galloway, chief engineer; M. L. Strawn, C. G. Dvorak, G. E. Moote, W. F. Hart, C. H. Briggs, G. W. Schepman, T. C. McDonald, E. H. Flook.

National Machinery Co., Tiffin, Ohio. Booth 1A 8.
National 1½ in. high-duty heading and forging machine; ⅛ in. automatic nut tapper; ⅞ in. automatic nut tapper.

National Twist Drill & Tool Co., Detroit. Booth 4B 5.
Interlocking slab milling cutters, heavy-duty parabolic type; staggered tooth side milling cutters; inserted blade high-duty face milling cutters; twist drills; reamers; milling cutters; hobs; special tools; taps; dies; screw plates. Represented by: Harry Butler, assistant manager of sales; George Ringstad, advertising manager; C. J. Oxford, chief engineer; W. R. Crook, H. C. Toomey, C. Cornwall, H. W. Springer, H. L. McGregor, president; C. E. Smith, vice-president and sales manager.

New Britain-Gridley Machine Co., New Britain, Conn. Booths 2A 3 and 2W 26.
No. 38 New Britain single-spindle, hydraulically operated work rotating chucking machines. Represented by: H. H. Pease, president; Edward L. Steinle, vice-president and sales manager; George O. Gridley, E. H. Wheeler and D. H. Montgomery, vice-presidents; R. S. Brown, secretary; Frank Rau; T. C. Stirling, G. K. Atkinson, L. E. Jolls, James W. Barr.

New Departure Mfg. Co., Bristol, Conn. Booth 5W 5.
New Departure bearing equipped spindle for vertical multiple spindle automatic; ball bearing equipped spindle and cylinder for large six spindle automatic; ball bearing equipped small high-speed internal grinder spindle; bearing equipped tailstock live centers of various sizes; various types of ball bearings used in machine tools. Represented by: F. G. Hughes, vice-president; T. C. D. Crow, chief engineer; J. H. Beninger, assistant chief engineer; F. W. Marschner, G. W. Fowler, L. H. Gaylord.

Niagara Machine & Tool Works, Buffalo. Booth 3W 20.
Niagara No. 68-B double crank power press, geared, four piece tie rod frame; No. 56 straight side single crank press, geared, four piece tie rod frame; No. 696 power gap squaring shear; No. 4½ inclinable power press, plain, flywheel type; new type No. 340 slip roll former; No. 172 electric combination machine with interchangeable rolls for beading, crimping, turning, wiring, burring, edging and slitting. Represented by: Russell J. Caplin, Dolph F. Lindgren.

Niles Tool Works Co., Hamilton, Ohio. Booth 2D 1.
36 in. and 44 in. side-head boring mill; Time Saver lathe; 62 in. boring and turning mill. Represented by: G. A. Rentschler, O. S. Ackley, L. C. Cole, A. C. Wais, A. T. Kuehner, J. E. Peterson, G. R. Shields, Harry Evans, Walter Brown, Carl Stomps.

Noble & Westbrook Mfg. Co., East Hartford, Conn. Booth 5W 3.

Power and hand operated marking machine for general purposes; rapid production single purpose marking machines; steel marking dies; steel stamps; automatic numbering heads for marking on metal. Represented by R. H. Noble, works manager; H. B. Knoble, superintendent, F. Berthold Helander, sales engineer; George Westbrook, president.

Norma-Hoffmann Bearings Corporation, Stamford, Conn. Booth 4W 4.

Ball, roller and thrust bearings; machine tools of the smaller sizes with sectioned bearing mountings; photographs of machine tool applications; Norma minimeter (a precision measuring instrument); Hoffmann bearing pedestals. Represented by: O. P. Wilson, vice-president; G. R. Bott, engineering manager; D. E. Batesole, assistant engineering manager; Harry L. Day, factory superintendent; C. A. Baden, plant engineer; H. J. Ritter, assistant secretary; R. E. Hecker, Cleveland district manager; C. D. Kilham, sales engineer; T. J. Harley, Chicago district manager.

Norton Company, Worcester, Mass. Booth 2A 10.

Crankpin grinding machine, hydraulic drive; crankshaft bearing grinding machine, hydraulic drive; plain cylindrical grinding machine, hydraulic drive, 10 x 48-in. size; open side surface grinding machine, hydraulic drive, 6 x 10 x 48-in. size; type A cylindrical grinding machine equipped with hydraulic wheel slide movement; type No. 50 crankshaft lapping machine; type No. 15-C cylindrical lapping machine. Represented by: W. L. C. Neilson, vice-president and general sales manager; G. N. Jeppson, vice-president in charge of manufacture; H. W. Dunbar, works manager; C. H. Norton, consulting engineer; A. G. Belden, chief engineer; S. Player, R. A. Cole, W. T. Montague, H. J. Griffing, H. P. Chace, H. Wickstrom, H. N. Harding, A. R. Sandine, John Cook, C. H. Hill, O. A. Knight, M. E. Mattson, G. C. Montague, O. E. Nordstrom, F. W. Smith, C. W. Atwood, H. S. Bowler, W. D. Briggs, H. O. Hedlund, E. W. Hellstrom, H. L. Swainey, G. B. Taft, G. E. Hulbert.

O

Oakite Products, Inc., 22 Thames Street, New York. Booth 4W 1.

Literature and data pertaining to the cleaning of metals, cutting, grinding, rust prevention and stripping finishes, and describing cleaning in industry generally. Represented by: H. L. Gray, A. W. Perry, L. B. Johnson.

Osterlein Machine Co., Cincinnati. Booth 1A 13.

No. 36 Milomatic (an automatic hydraulic reciprocating and indexing bed type milling machine); 28-in. tilted offset miller; 48-in. tilted offset miller; No. 2 Universal standard miller; No. 2 grinder. Represented by: C. D. Oesterlein, Charles Freudenthaler, A. H. Merschel, David F. Noble, G. A. Richey, Carl Kline.

Ohio Machine Tool Co., Kenton, Ohio. Booth 2D 8.

36-in. Super-Dreadnaught shaper; 24-in. shaper; Swift No. 35 flue welder; No. 6 combination copper and steel welder; No. 12 automatic welder; No. 16 projection welder. Represented by: Charles C. Swift, Cecil J. Davis, F. E. Taylor, H. A. Woofter.

Oilgear Company, 647 Park Street, Milwaukee. Booth 2A 5.

Oilgear 25-ton Gooseneck type straightening press; twin-12 horizontal broaching machine; automatic variable delivery machine tool feed equipment. Represented by: H. M. Swigart, president; W. D. Creider, general manager; G. H. Fobian, sales manager; J. P. Ferris, chief engineer; Ernst Weidman, mechanical engineer; E. C. Wollaeger, Donald Clute, W. G. Prasse, E. H. H. Graf, M. E. Engebretson, Frank Kuhagen, A. Hoffman, J. O'Rourke, L. M. Gross.

O. K. Tool Co., Inc., Shelton, Conn. Booth 4B 7.

O. K. metal cutting tools, lathe planer, boring mill and boring tools and holders; including inserted blade milling cutters; boring and facing heads, hollow mills and multiple operation tools. Represented by: R. R. Weddell, chief engineer; F. S. Schroeder, J. W. Costello, L. F. King.

Oliver Instrument Co., Adrian, Mich. Booth 1W 6.

No. 51 Oliver drill grinder; Arc face mill grinder No. 2; drill point thinner; tap grinder; No. 21 drill grinder; S-4 die making machine; heavy duty die making machine. Represented by: E. C. Oliver, Robert J. Sack.

Oster Mfg. Co., 2057 East Sixty-first Place, Cleveland. Booth 3W 17.

Pipe and bolt threading and cutting-off tools and machines. Represented by: A. S. Gould, secretary; R. E. Hyde, chief engineer; R. E. Willis, R. J. Oster.

P

Peerless Machine Co., Racine, Wis. Booth 1A 11.

Metal sawing machines of 6 x 6 in. and 9 x 9 in. capacity. Peerless universal type; metal sawing machines of 14 x 16-in. capacity for heavy-duty work, and billets and large diameters of metal; Chicago No. 2 power pipe threading machine ¼-in. to 2-in. capacity; universal No. 2 portable pipe cutting and threading machine of ¼-in. to 2-in. capacity. Represented by: Charles Rasmussen, president; I. M. Ward, vice-president; R. T. Ingalls, secretary-treasurer; O. M. Jensen, superintendent; A. H. Goetz, sales manager.

Porter-Cable Machine Co., Syracuse, N. Y. Booth 1W 19.

Manufacturing lathe; universal milling machine attachments; portable electric hand belt grinders; portable electric hand saws; two-way belt grinder; flexible belt grinder; spindle sander; disk grinders and sanders; horizontal disk grinder. Represented by: D. J. Ridings, sales manager; A. N. Emmons, chief engineer; E. A. Herrig, F. P. Morrow, G. H. Potts.

Potter & Johnston Machine Co., Pawtucket, R. I. Booth 3W 6.

Automatic chucking machines; automatic chucking or turning machine. Represented by Norman R. Earle, manager of sales.

Pratt & Whitney Co., Hartford, Conn. Booth 2D 1.

13 x 30-in. model B lathe with full relieving attachments; 16 x 36-in. model B lathe; 20 x 48-in. model B lathe; bench machine tool equipment including a P & W bench lathe, No. 3 Universal bench miller, No. 0 Sigourney drill; 14-in. vertical surface grinder; 6-in. vertical shaper, model B; 12-in. vertical shaper, model B; No. 1A and 3A jig borers with regular equipment and full attachments, including indexing table; No. 2 vertical automatic; six-spindle vertical deep-hole driller; complete line of gages; small tools; taps, dies, reamers, milling cutters, punches, etc. Represented by: C. R. Burt, vice-president and general manager; W. P. Kirk, general sales manager; Charles M. Pon, manager small tool and gage divisions; David Ayr, manager machinery division; Frank Hoagland, master mechanic; A. H. d'Arcambal, sales manager small tools and gages; E. C. Shultz, advertising manager; William Law, Harold Welch, M. S. Bradley, William Hunter, P. C. McBeth, H. William Kopf, R. W. Henke, J. D. Allan, Frank Schreiner, D. S. Woods, B. A. Donahue, L. A. Quinn, D. D. Brumbaugh.

Producto Machine Co., Bridgeport, Conn. Booth 1W 14.

No. 50 Producto-Matic milling machine equipped with a four-station flat turret type of work holding fixture; No. 12 automatic single-spindle cam milling machine. Represented by: N. M. Marsilius, president; E. A. Harper and A. J. Cummings, vice-presidents; M. E. Gombar, engineer.

Thomas Prosser & Son, 15 Gold Street, New York. Booth 4C 6.

Widia tungsten carbide lathe tools; planer tools; shaper tools; drills; reamers; milling cutters; boring tools; special tools. Represented by: R. D. Prosser, general manager; W. E. Guild, sales manager; E. R. S. Reeder, J. A. Deakin.

Q

Q-C Engineering & Tool Sales, Inc., 7 East Grand Avenue, Detroit. Booth 4A 6.

Airflex riveting hammers; Roto live centers; Q-C drill bushings and locating pins; quick-clamp standardized fixture units. Represented by: A. H. Pearson, president; A. M. Sargent, assistant general manager; R. E. Bloye, R. W. Burgess, G. D. Scott.

R

Racine Tool & Machine Co., Racine, Wis. Booth 2W 20.

10 x 10-in. Racine shear cut production saw; 6 x 6-in. shear cut production saw, screw feed; 6 x 6-in. gravity feed high-speed saw; 4 x 4-in. junior saw; duplex band saw. Represented by: M. E. Erskine, president; E. R. Larson, J. S. Toohey, William Reinhardt, P. F. Schatzman, S. P. Schafer, P. O. Ott, R. Fuller.

Ramsey Chain Co., Albany, N. Y. Booth 4W 3.

A tachometer exhibit showing lack of friction in chain; panel exhibit showing three Ramsey silent chains operating on small sprockets. Represented by: D. I. Wheeler, sales manager; H. N. Davis, manager Cleveland branch; Daniel Kessler, manager Chicago branch; F. H. Trombley, sales engineer Cleveland branch.

Reed-Prentice Corporation, Worcester, Mass. Booth 2W 2-3.

No. 3 Reed-Prentice new model high-speed ball bearing vertical milling and die sinking machine; 16-in. new model Reed-Prentice sliding geared head lathe; No. 5 Reed-Prentice new model vertical milling and jig boring machine. Represented by: R. C. Blackinton, chief engineer; F. W. McIntyre, vice-president; D. C. Forsman, A. W. Schneider, works manager; G. W. McIntyre, J. A. Benson.

Reliance Electric & Engineering Co., 1088 Ivanhoe Road, Cleveland. Booth 6A 6.

Reliance type T heavy-duty d. c. motors and fully enclosed

fan-cooled motors. Represented by: R. O. Herbig, R. A. McDowell, J. W. Corey, C. L. Peterson, H. H. Howard.

Rickert-Shafer Co., Erie, Pa. Booth 2C 10.
Automatic single purpose threading machines; self-opening die heads; collapsible taps; automatic and semi-automatic tapping machines; chaser grinders; boring heads; chasers. Represented by: George E. Shafer, president; August A. Rickert, treasurer; Arthur A. Shafer, secretary; C. W. Howard, sales manager and representative; J. W. Shea, service manager and assistant representative.

Rivett Lathe & Grinder Corporation, Brighton, Boston, Mass. Booth 5B 5.
Blanchard pulsating system for automatic oil lubrication for machinery; Forkup, Forkans, Forkguns for controlled oil lubrication, pressure grease appliances and systems. Represented by: Frederick C. Blanchard, chief engineer; Thorvald S. Ross, president.

Rockford Drilling Machine Co., Rockford, Ill. Booth 2W 25.
Rockford Two-Way production boring machine; Pullmore industrial clutches. Represented by: E. C. Traner, W. W. Blomberg, J. L. Peterson.

Rockford Machine Tool Co., Rockford, Ill. Booth 2B 3.
Rockford shaper-planer, 42-in. hydraulic driven; 24-in. Rockford Hy-service shaper. Represented by: Morris Monson, production manager; H. B. Newton, vice-president and general manager; R. C. Lind, president; A. B. Leet, chief engineer; J. G. Anderson, superintendent.

Ross Mfg. Co., Cleveland. Booth 4W 9.
Mechanical emery wheel dressing and truing tools; machine cooling fluid pumps. Represented by: M. L. Climo, W. C. Weslow, H. Joslin, D. Kelleher, H. P. Meyer, F. A. Centner.

Rotor Air Tool Co., 5704 Carnegie Avenue, Cleveland. Booth 5B 8.
Portable air drills, grinders, sanders and buffers. Represented by: H. P. Bailey, president; K. L. Pohlman, vice-president; R. J. Cook, factory representative; W. G. Baily, Cleveland district manager; F. B. Engeln, sales department.

Joseph T. Ryerson & Son, Inc., Sixteenth and Rockwell Streets, Chicago, Booth 2D 2.
No. 3, 4 and 7 Ryerson combination shear punch and coper for punching, shearing, coping and notching structural shapes, plates, bars, etc.; 300-ampere Wilson arc welder in operation in a glass booth; No. 2 Ryerson serpentine shear for cutting irregular shapes from sheet steel; Ryerson flue cutter and polisher and Ryerson flue roller; Ryerson No. 0 high-speed friction saw for cutting light metal shapes, moldings, etc.; Ryerson No. 0 high-speed friction saw with rotating attachment for cutting tubes, bars, etc. Represented by: A. G. Bryant, manager; A. P. Schumann, assistant sales manager; R. S. Armstrong, assistant sales manager; I. B. Yates, V. N. Towers, Chicago; H. J. Aagaard, J. M. Lewis, F. J. Clark, F. G. Grosse, R. C. Page, D. MacArthur, J. C. Buckels, W. R. Sprague, T. W. Delanty, I. J. Vyduna, H. D. Broxon, E. J. Burki, E. N. Carlson, A. L. G. Gentles, G. H. Merriell, H. L. Robinson, O. A. Bloomquist, J. A. Egbert, J. M. Eckes, S. J. Johnson, M. C. Fidgeon, A. L. Nacke, R. H. Happersett, E. A. Lynch, H. M. Shaw, D. B. Parker, D. S. Mair, C. J. Harter. P. H. Petersen.

S

Safety Grinding Wheel & Machine Co., Springfield, Ohio. Booth 2B 10.
Heavy portable grinder, Rite Speed floor grinders, grinding wheels for every purpose. Represented by: Charles W. Gwyn, president and manager; H. G. Weinland, secretary; H. G. Bennett, W. H. Vance, C. A. Wampfler, R. S. Dilliard.

Sebastian Lathe Co., Covington, Ky. Booth 1W 24.
20-in. semi-automatic production lathe; 15-in. motor-driven lathes; 11-in. motor-driven lathe; 11-in. high-speed production lathe. Represented by: E. E. Stokes, president; C. R. Cooper, purchasing agent; William Schroeder, superintendent; Ray Rece.

Wm. Sellers & Co., Inc., Philadelphia. Booth 2A 6.
No. 2A drill grinder, capacity 5/16 in. to 3 in. in diameter; drill point thinning machine, capacity ½ in. to 3 in.; No. 1A tool grinding and shaping machine, capacity up to 3 x 3 in.; No. 2 tool grinding and shaping machine, capacity up to 1½ x 2 in.; No. 1 hob and cutter grinder for sharpening straight and spiral gashed hobs up to 12 in. long 12 in. diameter, reamers, taps, spiral milling cutters, etc. Represented by Alexander Sellers, George H. Benzon, John D. McClintic, E. L. Holljes, Coleman Sellers, 3rd, J. C. Hinton, William Sellers, D. F. Robinson, A. Sellers, Jr.

Seneca Falls Machine Co., Seneca Falls, N. Y. Booth 1A 9.
Seneca Falls turning equipment; Lo-Swing lathes; semi-automatic lathe; full automatic lathes; Short-Cut production lathes. Represented by: E. R. Smith, vice-president and general manager; J. A. Fyfe, secretary; P. Branigan, A. Schinkez, F. E. Joel, F. C. Herbert, F. E. Webb, M. C. Day, W. H. Nettle, G. E. Fogarty.

Sidney Machine Tool Co., Sidney, Ohio. Booth 2W 6.
22-in. x 12-ft. Monotrol engine lathe; 16-in. x 6-ft. Monotrol toolroom lathe; 18-in. x 8-ft. Tritrol lathe; open Monotrol geared headstock. Represented by: A. C. Getz, general manager; B. A. Getz, sales manager; F. H. Dickas, chief engineer; A. L. Jennings, superintendent; L. S. Kirdy, W. A. McClure.

Siewek Tool & Die Co., 10233 Woodward Avenue, Detroit. Booth 6A 3.
Represented by O. H. Siewek.

Simonds Saw & Steel Co., Fitchburg, Mass. Booth 4B 4.
Circular and band saws for cutting metal; files; Red Streak hack saws; abrasive grinding wheels. Represented by: George T. Curtis, Harry P. Baumann.

S K F Industries, Inc., 40 East Thirty-fourth Street, New York. Booth 4W 12.
Ball and roller bearings for machine tools. Represented by: P. T. Hopper, W. F. Temple, R. Smith, P. R. Payson, F. E. Ericson, R. H. DeMott, W. Jetter, R. R. Zisette.

Skinner Chuck Co., New Britain, Conn. Booth 4W 13.
Lathe chucks of various sizes and weights; face plate jaws; drill press vises; milling machine vises; drill chuck; air chucks. Represented by: A. E. Thornton, assistant treasurer; D. M. Stevenson.

Sleeper & Hartley, Inc., Worcester, Mass. Booth 5A 1.
No. 2 Universal spring coiling machine with wire reel. Represented by W. H. Blount.

Smith & Mills Co., Cincinnati, Ohio. Booth 2W 19.
One 25-in. back-geared heavy-duty crank shaper constant speed motor drive complete with 7½-hp. motor; One 12-in. single-geared crank shaper constant speed motor drive complete with 2-hp. motor. Represented by: J. E. Mills, president, and W. J. Struewing, superintendent.

Springfield Machine Tool Co., Springfield, Ohio. Booth 1W 7.
14-in. x 6-ft. quick-change geared-head engine lathe; belted motor drive in leg, with taper attachment, Timken bearings, draw-in collet attachment with collets; 18-in. x 8-ft. quick-change geared-head engine lathe, belted motor drive in leg, taper attachment, oil pan, Timken bearings and turret tool post; machine for removing gear teeth from flywheels. Represented by: Edward S. Montanus, secretary, and Paul A. Montanus, vice-president.

Standard Electrical Tool Co., 1938 West Eighth Street, Cincinnati, Ohio. Booth 4C 4.
Portable electric drills; electric-driven grinders; electric-driven buffers; electric-driven polishing machines. Represented by G. H. Feltes, president.

Standard Steel Specialty Co., Beaver Falls, Pa. Booth 5C 5.
Machine keys; Woodruff keys; machine rack; taper pins; elevator guides; special milled sections. Represented by: E. J. Wagner, president, and J. B. Jamison, secretary and sales manager.

Standard Tool Co., 6918 Central Avenue, Cleveland. Booth 5W 2.
Twist drills; reamers; taps; milling cutters; drill chucks. Represented by: H. C. McKean, general manager; W. P. Ross, manager of sales; R. R. Higgins, assistant sales manager; H. R. Hanson, C. C. Buck, T. D. Bascom and J. G. Green.

Stark Tool Co., Waltham, Mass. Booth 1W 23.
Stark Precision lathes; bench milling machine; motor drive unit. Represented by: Frederick T. Potter, factory manager, and E. Clifford Potter, president.

L. S. Starrett Co., Athol, Mass. Booth 5W 8.
Mechanical tools; gages; micrometers; indicators; rules; squares; hack saws; steel tapes. Represented by: H. E. Masters, W. D. Starrett, J. G. Sisson, D. Findlay, sales manager A. H. Starrett and O. J. Rogers.

Stockbridge Machine Co., Abbott Street, P. O. Box 44, Worcester, Mass. Booth 1W 13.
Barrett centrifugal oil extractor, model 1200; centrifugal dryer, model 502; centrifugal washer, model 251; Stockbridge heavy-duty back-geared shaper with patented two-piece crank. Represented by: Leon J. Barrett, R. A. Johnson, H. G. Kilbourne, C. B. Laing and N. F. Holter.

D. A. Stuart Oil Co., 2733 South Troy Street, Chicago. Booth 4W 5.
Stuart's Thread-Kut alloy steel cutting oil; Super-Kool light-colored heavy sulphur base oil; Codol liquid grinding compound; Kleen-Kut soluble oil; Drawsol deep drawing compound; No. 34 soluble quenching oil. Represented by: T. B. Langdon, W. H. Oldacre, C. H. Baker, G. A. Dudley, J. W. Beaver, C. I. Grierson and A. S. Hull.

Sunstrand Machine Tool Co., Rockford, Ill. Booth 1A 7.
No. 40 Rigidmil; No. 33 Rigidmil; No. 22 Rigidmil; No. 3 Rigidmil; 8-in. brake drum lathe; 15-in. automatic stub lathe; 4 x 24-in. centering machine. Represented by: Hugo

L. Olson, president and general manager; G. D. Sundstrand, chief engineer; D. B. Burleigh, general sales manager; L. A. Dumser, assistant chief engineer; Gust H. Ekstrom, works manager; G. A. Markuson, T. B. Buell and A. E. Gutzwiller.

Sun Oil Co., Philadelphia. Booth 4A 4.
Emulsifying and straight cutting oils; machines demonstrating cutting oils; machined parts. Represented by: R. S. Drysdale, C. K. Hague and C. B. Harding.

Superior Machine Tool Co., Kokomo, Ind. Booth 3W 18.
Superior type M-10-in. bench drill, motor-driven; type B-20-in. floor drill, motor-driven; type HD-25-in. floor drill, motor-driven. Represented by: E. A. Simmons, president; C. E. Hansell, secretary; O. L. Ham and M. L. Hensley.

Swift Welder Co., Kenton, Ohio. Booth 2D 8.
36-in. Super-Dreadnaught shaper; 24-in. dreadnaught shaper; Swift No. 35 flue welder; No. 6 combination copper and steel welder; No. 12 automatic welder; No. 16 projection welder. Represented by: Charles C. Swift, Cecil J. Davis, F. E. Taylor and H. A. Woofter.

T

Taft-Peirce Mfg. Co., Woonsocket, R. I. Booth 3W 11.
Adjustable reamers; angle irons; box parallels; boring tool holders; contract service; plug, ring, snap and thread gages; parallels; production and inspection tools; sine bars; Superpower magnetic chucks; surface plates; thread milling machine; toolmakers' knees; V blocks. Represented by: F. S. Blackall, Jr., P. V. Miller, W. E. Rogers and E. D. Wolf.

Taylor & Fenn Co., Hartford, Conn. Booth 2A 3a.
Two-spindle horizontal spline milling machine; high-speed vertical milling machine; two-spindle drilling machine with built-in motors on the head; four-spindle drilling machine; No. 0 spring press; No. 00 spring press; No. 12 motor-driven spring press. Represented by: George S. DeLany and Nels Carlson.

Thompson Grinder Co., Springfield, Ohio. Booth 2W 13.
Thompson 12 x 36-in. self-contained motor-driven Universal grinding machine. Represented by: C. Baldenhofer, president and general manager; H. J. Warrick, vice-president and secretary; W. G. Baldenhofer and J. A. Martin.

Timken Roller Bearing Co., Canton, Ohio. Booth 4W 2.
Timken tapered roller bearings. Represented by: L. M. Klinedinst, W. B. Moore, R. P. Kelley, J. W. Weir, G. D. Thewlis and S. M. Weckstein.

Titeflex Metal Hose Co., 500 Frelinghuysen Avenue, Newark, N. J. Booth 5B 7.
Titeflex all-metal flexible tubing, for the carrying of lubricants and cutting compounds. Represented by: Elbert E. Husted, sales manager, and R. R. Hazel.

Torrington Co., Torrington, Conn. Booth 1W 1.
Three sizes of Dayton-Torrington swaging machines; Torrington ball bearings. Represented by: F. T. Case, G. H. Schneider and M. W. Maine.

Tuthill Pump Co., 131 West Sixty-third Street, Chicago. Booth 5C 3.
No. 1R reversing pump for handling coolant; No. 6M motor-driven pump for handling coolant; No. 2M motor-driven pump for handling coolant; OB motor-driven pump for lubricating or hydraulic service; No. 6C tight and loose pulley drive pump for handling quenching oil; No. 2MS pump unmounted; No. 2CS pump unmounted; Tuthill high-pressure pump for hydraulic service, unmounted. Represented by: G. B. Tuthill, H. E. Kempton, W. C. Croft and H. C. Osborne.

Twin Disc Clutch Co., Racine, Wis. Booth 4W 15.
Dry plate type clutches; multiple disc clutches designed to operate in bath of oil. Represented by: P. H. Balten, president; W. C. Gewalt, vice-president; G. M. Guilbert, secretary and sales manager; R. H. Smith, W. L. Dixon, G. L. Williams.

U

Union Mfg. Co., New Britain, Conn. Booth 5C 8.
Lathe chucks; boring mill chucks; planer chucks; drill chucks; face plate jaws; boring mill jaws; chain hoists. Represented by: C. S. Neumann, president; F. J. Wachter, vice-president and sales manager; A. E. Church, E. I. Stevens.

United States Electrical Tool Co., 2488 West Sixth Street, Cincinnati. Booth 1A 15.
Electric direct-connected grinders and buffers; electric lathe grinders; portable grinders; electric drills. Represented by: G. M. Lawrence, sales manager; G. E. Smith, treasurer; J. A. Smith, president; H. O. Coe, J. C. Goodman, R. H. Clore, F. Franklin, W. B. DaSilva, R. N. Brayer, H. B. Griner, H. N. Kelsey and J. R. Miller.

Universal Boring Machine Co., Hudson, Mass. Booth 2B 4.
No. 40 Triway Universal horizontal boring machine; Hanson measuring attachment. Represented by: John C. Spence, works manager; Leon F. Marsh, Warren B. Robbins and Walter H. Chapman.

V

Van Dorn Electric Tool Co., 3000 Woodhill Road, Cleveland. Booth 4B 3.
Portable electric drills; screw drivers; tappers; nut setters; reamers; portable and stationary polishers; grinders; buffers; drilling and grinding stands, bench type; portable electric hammers; portable automatic heat control glue heaters; electric valve refacers; valve reseating cutters; portable disc sanders; portable electric socket wrench; high frequency portable high production tools. Represented by: F. Schneider, president; F. H. Zulauf, vice-president and general manager; R. W. Proctor, sales manager; E. W. Waechter, assistant sales manager; E. L. Connell, chief engineer; S. S. Waters, L. L. Charnicky, F. R. DuGuay.

Van Norman Machine Tool Co., 150 Wilbraham Avenue, Springfield, Mass. Booth 1A 14.
No. 10 Van Norman Duplex miller, motor-driven, with worm index centers and high-speed spindle; No. 3 Duplex miller, motor-driven, with 10-in. full Universal centers, sub-head, and Universal slotting attachment; No. 25 oscillating grinder, motor-driven, with full ball bearing work heads, special chucking device and water equipment. Represented by: C. E. Van Norman, president; F. D. Van Norman, vice-president; J. Y. Scott, general sales manager; L. H. Campbell, vice-president; William M. Edes, Roger Pyne, H. Bordeaux.

W

O. S. Walker Co., Inc., Worcester, Mass. Booth 2W 8a.
Single-stroke surface grinding machine; magnetic chucks. Represented by: George F. Shirley, Elzcar Laporte, Clayton O. Smith, Howard E. Tracy.

Warner & Swasey Co., Cleveland. Booth 1A 1.
No. 5-A and 1-A Universal hollow hexagon turret lathes in operation on actual work; No. 5 and No. 4 Universal all geared-head turret lathes in operation on actual work. Represented by: P. E. Bliss, president; A. C. Cook, vice-president; C. J. Stilwell, vice-president and general sales manager; E. R. Gardner, H. R. Ward, L. K. Berry, A. H. Keetch, W. K. Bailey, W. L. Loegler, C. S. Stilwell, G. Kochenderfer, F. J. Pelich, L. M. Cole, L. R. Hawkins.

Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Booth 5B 1.
Motor starters; motors; gears; belt drive (cog belt); controllers for motors; electric welders. Represented by: Bernard Lester, C. B. Stainback, H. L. Wilson, P. McShane, W. W. Reddie, J. M. Wetzig.

Whitney Mfg. Co., 237 Hamilton Street, Hartford, Conn. Booth 2B 6.
Chains and sprockets for power transmission. Represented by: R. A. Glass, R. A. Follensby and S. C. Smith.

Whitney Metal Tool Co., Rockford, Ill. Booth 2W 16.
Ball bearing metal punches; lever type metal punches; deep throat metal punches; angle iron machinery; notcher; benders; shears; awls; hammers; rivet sets. Represented by: John Jensen, secretary and manager, and August Jensen.

Williams Tool Corporation, Erie, Pa. Booth 3W 3.
6-in. Williams Rapiduction pipe threading machine; 2-in. double spindle bolt threader; 2-in. portable pipe threading machine; 4-in. Wilco pipe threading machine. Represented by: E. P. Poole, vice-president; D. Moreinis, C. Tankred and H. VanOsten.

Wisconsin Electric Co., Racine, Wis. Booth 5C 4.
No. 5 grinder with attachments A, B and C; No. 3 grinder, tool shop utility tool; No. 2-AG grinder drills; No. 1 grinder motors. Represented by: C. A. Pope, W. B. O'Neill, W. E. Pomeroy.

Y

Yale & Towne Mfg. Co., Stamford, Conn. Booth 4C 5.
Yale chain blocks, trolleys, cranes, electric hoists, motor-driven trolleys, electrical industrial trucks, hardware, locks. Represented by: J. C. Morgan, E. H. Fairchild, H. S. Pierson, R. H. Irwin, F. A. Dewey, M. G. Peck, R. L. Higgins, C. O. Hedner.

Machinery Markets and News of the Works

Tool Demand Drops Slightly

Sales of Heavy Machines, However, Have Been Considerably Better Than in August

ALTHOUGH a decrease in machine tool sales is reported from some centers, business the past week was in fairly substantial volume. Many buyers are refraining from making further major purchases until after the National Machine Tool Exposition in Cleveland, but this tendency is not pronounced in the demand for planers, boring mills and other heavy tools, orders for which have been considerably better than in August.

The General Electric Co. has not yet closed for a number of lathes for its Schenectady, N. Y., works and has postponed placing orders for its Lynn, Mass., plant until next month. The Westinghouse Electric & Mfg. Co. is continuing to order tools for its electric refrigerating manufacturing division at Springfield, Mass., and Pullman Co. is expected to close soon for 18 motor-driven tools for delivery to Buffalo. The United States Aluminum Co., New Kensington, Pa., has begun contracting for equipment for its new machine shop. Union Drydocks, Inc., Port Richmond, N. Y., is inquiring for a list of tools.

The Amtorg Trading Corporation, which was reported a week ago as having closed for a large number of lathes, is negotiating for further equipment, including turret lathes, punches and shears, for shipment to Soviet Russia.

Despite a falling off in fresh bookings this month, unfilled orders of machine tool builders are sufficient to insure production at full capacity during the remainder of the year and in some cases well into 1930.

The National Machine Tool Builders' Association states that the volume of orders booked by members during August recovered considerably from the July recession and was 23 per cent greater than in August, 1928. The association's index shows the three months' average of gross orders at 286.1 for August, a 30 per cent gain over the same month of last year. Unfilled orders at 692.5 were approximately the same as in July. Machine tool plants, declares the association, have been operating overtime to catch up on unfilled orders, still two and a half times current shipments.

New York

NEW YORK, Sept. 17.—Inquiry for machine tools is considerably smaller than in August, but this is attributed by sellers to the desire of buyers to wait until after the National Machine Tool Exposition in Cleveland. Meanwhile, the Amtorg Trading Corporation, New York, which has closed on engine lathes and automatic screw machines for export to Russia, is still negotiating for a list of tools, including turret lathes and punches and shears. The General Electric Co. has not yet closed on lathes for Schenectady, and has postponed purchases for Lynn, Mass., until next month. Recent buying by this company has been for divisions other than the refrigerator manufacturing plant. The Westinghouse Electric & Mfg. Co., however, continues to buy tools for its refrigerator plant at Springfield, Mass., and last week closed for equipment including five engine lathes. Union Drydocks, Inc., Port Richmond, Staten Island, N. Y., is in the market for a number of machine tools and has bought some used equipment. Builders are fully engaged, and deliveries on most tools range from early December to late January or early February.

Murcott & Campbell, 298 Union Avenue, Brooklyn, manufacturers of files, rasps, etc., have awarded general contract to Polito Construction Co., 1601 Avenue P, for one-story plant to cost about $40,000 with equipment. Tillion & Tillion, 415 Lexington Avenue, New York, are architects.

Union Railway Co., 2396 Third Avenue, New York, will build a one-story car repair and equipment works, 34 x 192 ft., to cost about $40,000 with equipment. E. H. Faile is company architect.

Frank S. Parker, 119 West Fifty-seventh Street, New York, architect, has filed plans for a six-story automobile service, repair and garage building, 197 x 200 ft., to cost about $500,000 with equipment.

Dictograph Products Corporation, 220 West Forty-second Street, New York, manufacturer of sound equipment and devices, has awarded general contract to Barney Ahlers Construction Co., 110 West Fortieth Street, for new one-story plant, 100 x 100 ft., at Long Island City, to cost more than $80,000 with equipment.

Union Carbide & Carbon Corporation, 30 East Forty-second Street, New York, is arranging for new stock issue of about $53,000,000, considerable part of which will be used for expansion. Work will include a hydroelectric power project near Glen Ferris, W. Va., to cost about $20,000,000. Construction of power dam has been started and it is understood plant is scheduled for completion in 1930.

Metropolitan Refining Co., 570 Seventh Avenue, New York, manufacturer of oils, colors, paints, etc., is planning new one-story plant, 60 x 175 ft., to cost about $65,000 with equipment.

Thompson Interstate Airways Corporation, operating Pioneer Aero Training School, Flushing, N. Y., is arranging for construction of airport on 280-acre tract in Northvale and Rockleigh Boroughs, Bergen County, N. J., consisting of hangars, repair shops, oil storage and other units, to cost more than $500,000 with equipment.

Certain-Teed Products Corporation, 100 East Forty-second Street, New York, manufacturer of roofing, etc., has leased one-story building at Irvington, Newark, 70 x 228 ft., for new factory branch, storage and distributing plant.

Swan-Finch Oil Corporation, 205 East Forty-second Street, New York, will rebuild part of oil refinery at Linden, N. J., destroyed by fire Sept. 14.

Western Electric Co., 195 Broadway, New York, has filed plans for three new six-story units adjoining works at Kearny, N. J., to cost more than $500,000. Largest structure will be equipped for manufacture of telephone equipment and parts.

Sipp-Eastwood Co., Paterson, N. J., has been organized with capital of 14,500 shares of stock, no par value, to take over and consolidate Sipp Machine Co., and Benjamin Eastwood Co., both manufacturers of textile machinery and parts. Officers of former companies will continue with merged organization, and will carry out expansion.

L. P. Croce Bottling Works, Inc., 930 Summerfield Avenue, Asbury Park, N. J., will soon take bids on general contract for three-story addition, to cost about $65,000 with equipment. C. B. Cook, Asbury Park Trust Building, is architect.

Karl Krause United States Corporation, 114 East Thirteenth Street, New York, American distributor for Karl Krause, Leipzig, Germany, manufacturer of automatic paper cutters, embossing presses, bookbinding and box-making machinery,

is in market for motors for its machines. R. Sunderhauf is secretary.

Alfred Hofmann, West New York, N. J., through Lockwood Greene Engineers, Inc., New York, has awarded general contract to Auf-der-Heide Contracting Co. for machine shop, 100 x 125 ft., for servicing knitting machinery and manufacturing electric lamp and radio tube machinery.

Modern Machine Works, Inc., recently formed, has leased a building at 7 Market Street, Paterson, N. J., to manufacture silk dyeing, finishing, printing and special machinery.

Sound Equipment Corporation, 16 East Fortieth Street, New York, has been organized to manufacture talking picture equipment on contract.

Eureka Metal Finishing Co., Inc., has opened a plant at 1465 Long Avenue, Hillside, N. J.

Philadelphia

PHILADELPHIA, Sept. 16.—Contract has been let by Griffith Tool Works, Second and Duncannon Streets, Philadelphia, to Albert F. Forster, 5440 North Mascher Street, for two-story addition, to cost about $25,000 with equipment.

United States Gypsum Co., 1500 Walnut Street, Philadelphia, with headquarters at Chicago, manufacturer of building products, has plans for an addition to local works, to cost about $150,000 with equipment.

Chester Auto Parts & Machine Co., Chester Pike, Ridley Park, Pa., has awarded general contract to M. Chester Campbell, 111 Market Avenue, for one-story addition, to cost about $30,000 with equipment.

Crane Co., 1301 Locust Street, Philadelphia, has plans for one-story factory branch and distributing plant, to cost about $85,000 with equipment. Headquarters are at Chicago. M. D. Robinson is manager at Philadelphia.

Pennsylvania Railroad Co., Philadelphia, will install elevating, conveying and other mechanical-handling equipment in three-story central freight terminal at Harrisburg, Pa., to cost about $100,000. T. J. Skillman is chief engineer.

Florence Pipe Foundry & Machine Co., Florence, N. J., has asked bids on general contract for one-story addition, to cost over $35,000 with equipment.

General Aero Corporation, operating Holmes Airport, Astoria, L. I., has purchased Amatol Speedway, Hammonton, near Atlantic City, N. J., totaling 500 acres, and plans airport and flying field at that location, including hangars, repair shop and other field units, to cost more than $300,000 with equipment. Clarence B. Chamberlain is consulting aeronautical engineer for company.

Board of Trustees, Pennsylvania State College, State College, Pa., will soon call for bids for new power plant, to cost more than $80,000 with equipment. Charles Z. Klauder, 1429 Walnut Street, Philadelphia, is architect; J. G. White Engineering Corporation, 43 Exchange Place, New York, is engineer.

Pusey & Jones Corporation, Wilmington, Del., has authorized an expansion and improvement program in shipbuilding department to cost about $250,000, including new building equipped with electric cranes and other machinery. Clement C. Smith is president.

New England

BOSTON, Sept. 16.—The past week was quiet with the majority of local machine tool dealers. Sales of new tools were mostly in lathes. Dealers state, however, that some promising inquiries have developed, but details are withheld. A few presses, lathes, milling machines and bench equipment were sold by used tool houses. Many machine tool builders have sufficient business booked to keep plants operating at capacity during the remainder of 1929 and some are booked well ahead into 1930.

F. S. Payne Co., 30 Richdale Avenue, Cambridge, Mass., has closed bids on a two-story, 50 x 100 ft., machine shop addition.

Martin Trailer Co., Westfield, Mass., has plans for a one-story factory, 80 x 100 ft., to cost $40,000 without equipment.

Chicopee, Mass., is taking bids for repairs and alterations to its electric lighting plant. Equipment will be purchased.

Bridgeport Boiler Works Co., 202 Housatonic Avenue, Bridgeport, Conn., has filed plans for a one-story addition, 100 x 146 ft., to cost $21,000 without equipment.

National Blank Book Co., Water Street, Holyoke, Mass., has plans for a five-story addition, 60 x 150 ft. Motors and miscellaneous equipment will be purchased.

Hartford Bearings Co., 603 Franklin Avenue, Hartford, Conn., has been organized to manufacture press metal bearings and sheet stampings.

Wilbert J. Nichols, 24 Center St., North Adams, Mass., has filed plans for a coal elevator to replace one recently destroyed by fire. Coal handling equipment will be purchased.

Chapman Valve Mfg. Co., Indian Orchard, Mass., is contemplating a foundry addition.

Following recent purchase of Everett Mills at Lawrence, Mass., for radio tube and equipment manufacture, Noma Electric Corporation, 340 Hudson Street, New York, affiliated with Pilot Radio & Tube Co., has acquired plant and business of New England Wire Co., Westfield, Mass., and will continue operations as a subsidiary. Plant has output of 200,000,000 ft. wire per annum, and large part of production will be used by purchasing company at new plant at Lawrence.

United States Rubber Co., Providence, R. I., will soon begin superstructure for one-story addition to local mill, 100 x 300 ft., to cost about $100,000 with equipment. General contract has been let to Cruise Construction Co., Pawtucket, R. I. Headquarters of company are at Broadway and Fifty-eighth Street, New York.

Warren Telechron Co., Ashland, Mass., manufacturer of bells, clocks, etc., a subsidiary of General Electric Co., is planning call for bids on general contract for one-story addition, to cost more than $50,000 with equipment. Fay, Spofford & Thorndike, 44 School Street, Boston, are engineers.

City Council, Bristol, Conn., is planning purchase of 84-acre tract at East Bristol as site for municipal airport, to include hangars, and mechanical field units, to cost about $100,000 with equuipment.

Eastern Massachusetts Electric Co., Washington Street, Salem, Mass., has plans for a superpower steam-operated electric generating station near local pier of Philadelphia & Reading Railway, to cost more than $10,000,000 with transmission lines. Property is operated under direction of Charles H. Tenney & Co., 200 Devonshire Street, Boston, Mass., engineers, and plans will be prepared at offices of that organization. Work is scheduled to begin early next year.

Pittsburgh

PITTSBURGH, Sept. 16.—Machine tool business has been fairly good this month, despite the fact that a number of purchases are definitely deferred until after the machine tool exhibit in Cleveland. It is reported that the largest buyer of tools in this district will send nearly 100 representatives to the show to check up on new developments before issuing inquiries for tools. The United States Aluminum Co., New Kensington, Pa., is placing tools for its new machine shop and will probably complete purchases before the end of the month. The Westinghouse Electric & Mfg. Co. will soon issue its fourth quarter list. Railroad buying has been lacking in the past few weeks, but is expected to improve as the carriers begin purchasing rails and other materials.

The extremely large backlogs of the heavy machinery makers in this district continue a feature of the market and at least two large manufacturers of steel mill equipment are reported to have enough orders for a year's operation. Additional business is being booked regularly and the problem of delivery is becoming more serious. Many steel companies will buy considerable more equipment than usual for replacement purposes as the high operations over the greater part of the year have tested facilities to the utmost.

Bradford Transit Co., Bradford, Pa., has been formed by officials of Tidewater Pipe Line Co. and South Penn Oil Co., 545 William Penn Way, Pittsburgh, and will be operated as subsidiary. Company will take over pipe lines of both organizations, totaling about 898 miles, and refinery of Emery Mfg. Co., Bradford, manufacturer of lubricating oils, etc. Expansion is planned including refinery extensions and additional pipe lines.

General Motors Corporation, Detroit, has plans by Albert Kahn, Inc., Marquette Building, architect and engineer, for one and two-story parts and service building, 145 x 215 ft., at Pittsburgh, to cost about $150,000 with equipment.

Carnegie Forge & Tool Co., Pittsburgh, care of Allen H. Kerr, 1108 Commonwealth Building, treasurer, recently formed by Mr. Kerr and associates with capital of $25,000, is said to be planning operation of local factory to manufacture tools and kindred products.

Board of Education, Beaver Falls, Pa., is contemplating manual training equipment in two and three-story high school to cost $230,000, for which plans are being completed by Carlisle & Sharrer, Martin Building, Pittsburgh, architects.

Katona Mining Co., 1241 Charleston Avenue, Huntington, W. Va., Samuel W. Perry, president, recently organized by Mr. Perry and associates, has acquired coal properties near East Lynn, W. Va., and plan construction of tipple, power house and other units, and installation of mining equipment. A 1½ mile standard gage railroad will be built. Entire project is reported to cost more than $125,000.

Air-Way Electric Appliance Corporation, Toledo, Ohio, manufacturer of electric heating and kindred equipment, has

purchased plant and business of Erie Heating System, Inc., Erie, Pa., and will consolidate. Plant will be removed to Toledo works, which will be expanded, and products of acquired company will be manufactured under name of Air-Way heating system.

Chicago

CHICAGO, Sept. 16.—The curve of machine tool sales for the past week is upward following a substantial volume of business of a widely diversified character. Farm implement manufacturers are signifying their need for miscellaneous items. The list of the International Harvester Co. for its Farmall works is reported to have been completed except for a few tool room machines, on which deliveries were not an important factor in making early purchases. Fresh inquiry is widespread and for the most part for single tools. The Pullman Company's list for Buffalo is holding the attention of dealers as it is the only list of size that is now before the local trade.

Additional requests for prices for budgets have been made by the railroads, which at the moment have almost wholly withdrawn from the market in the matter of placing orders.

Prices and deliveries remain stationary. The used tool market is active, the number and variety of machines sought being in excess of the available supply.

Scully Steel & Iron Co., 2364 South Ashland Avenue, Chicago, will build a one-story warehouse, 105 x 221 ft., to cost $30,000. G. Barry, 180 North Michigan Avenue, is architect.

Gary Screw & Bolt Co., 2217 West Forty-third Street, Chicago, will erect a one-story shop, 40 x 50 ft. John Boeringer, 53 West Jackson Boulevard, is architect.

Faith Mfg. Co., 2531 North Ashland Avenue, Chicago, manufacturer of radiator caps and kindred metal products, has asked bids on general contract for two-story plant unit, to cost about $45,000 with equipment.

Barco Mfg. Co., 1777 Winnemac Avenue, Chicago, manufacturer of railroad supplies and equipment, has plans for a three-story addition, 50 x 225 ft., to cost about $140,000 with equipment. R. E. Pingrey & Co., 134 South La Salle Street, are architects.

Carlson, Holmes & Bromstad, Inc., 3231 West Thirtieth Street, Chicago, manufacturer of cabinets, etc., has acquired for expansion one and two-story plant at Thirty-first Street and Kedzie Avenue, on site, 598 x 600 ft.

Modern Handy Button Machine Co., 2407 West Ohio Street, Chicago, has awarded general contract to Louis Padorr & Son, 33 North La Salle Street, for one-story addition to cost about $40,000 with equipment. Harry Glube, 360 North Michigan Avenue, is architect.

City Council, Muscatine, Iowa, is considering extensions and improvements in municipal electric light and power plant, to cost about $80,000 with equipment. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is engineer.

Davenport Airways, Inc., Davenport, Iowa, care of N. H. Tunnicliff, Citizens Building, representative, has plans for an airport and flying field at Cramfield, near city limits, including hangars, and mechanical field units, to cost about $100,000 with equipment.

The Crane Market

INQUIRY for overhead traveling cranes has been small since the first of the month, but there is a substantial number of inquiries pending award. The Amtorg Trading Corporation, New York, is inquiring for a 20-ton hand power crane for export to Russia. The Union Drydocks, Inc., Port Richmond, S. I., New York, which recently inquired for two small capacity overhead cranes, has postponed purchase until after Jan. 1.

Bowman Dairy Co., River Forest, Ill., has plans drawn for a two-story bottling plant and power house, 200 x 320 ft., to cost about $500,000 with equipment. Frank B. Gray, 73 South La Salle Street, Chicago, is architect.

Board of Education, Emmettsburg, Iowa, is considering installation of manual training equipment in two and three-story senior and junior high school, to cost $170,000, for which plans will be drawn by Keffer & Jones, Masonic Temple, Des Moines, Iowa.

Gardner-Denver Co., Quincy, Ill., manufacturer of slush pumps, air compressors, pneumatic tools, drill sharpeners and high-pressure drill steel forges, has let general contract for an addition to increase production facilities 50 per cent.

South Atlantic

BALTIMORE, Sept. 16.—Aviation Corporation of the Americas, Inc., 100 East Forty-second Street, New York, operating Fairchild Airplane Mfg. Co., 270 West Thirty-eighth Street, and other aircraft units, has taken option on 500-acre tract on Back River, near Todd's Point, Baltimore, as site for new plant to manufacture all-metal flying boats and other combination sea and aircraft. Initial works will comprise units for parts production and assembling, to cost about $750,000 with equipment. Graham B. Grosvenor is president.

Horace E. Dodge Boat & Plane Corporation, care of J. Gilmore Fletcher, 511 Fifth Avenue, New York, vice-president and managing director, has purchased 100-acre tract at Newport News, Va., as site for new plant to manufacture motorboats, flying boats, amphibian airplanes and kindred seacraft. Works will include buildings for parts manufacture and assembling, and will cost about $1,000,000 with equipment. Horace E. Dodge, Jr., is president.

General Gas & Electric Corporation, 50 Pine Street, New York, operating Lexington Water Power Co., Lexington, S. C., and other utilities, has arranged for a preferred stock issue to total $14,850,000, part of proceeds to be used for expansion, including hydroelectric power development in South Carolina. Work is under way on hydroelectric generating station near Columbia, S. C., to have initial capacity of 130,000 kw. Project will include transmission system.

Interstate Milling Co., West Tenth Street, Charlotte, N. C., has plans for addition to feed milling plant to cost about $70,000, including elevating, conveying, screening and other equipment.

McClaren Rubber Co., Charlotte, N. C., has plans for expansion, including installation of additional equipment, to cost over $40,000.

Walter Dobbins, Aiken, S. C., is at head of project to construct an ice-manufacturing plant at Spartanburg, S. C., to cost about $65,000 with machinery.

Kraft-Phenix Cheese Corporation, 400 Rush Street, Chicago, plans installation of conveying equipment and other machinery at milk condensing plant at West Jefferson, N. C.; a power house is proposed. Entire project will cost about $100,000.

City Council, Kinston, N. C., is considering extensions and improvements in municipal electric light and power plant, to cost about $100,000 including equipment.

Old Dominion Manganese Corporation, Crimora, Va., will make extensions and improvements in local manganese properties and install additional mining equipment.

Detroit

DETROIT, Sept. 16.—Contract has been let by Grand Trunk Railway System, 400 East Jefferson Avenue, Detroit, to Ellington Miller Co., 417 South Dearborn Street, for engine house, machine shops and power house at Pontiac, Mich., to cost about $100,000 with equipment.

Wayne County Board of Commissioners, Barlum Tower, Detroit, is asking bids until Sept. 23 for pumping plant to cost more than $400,000. F. S. Slater, 16134 Princeton Avenue, is architect; Hubbell, Hartgering & Roth, Buhl Building, are engineers.

Michigan Brass & Iron Works, Lansing, Mich., has resumed production following recent fire. New units have been built and capacity will be increased. Company is considering erection of a one-story addition on adjoining site for its brass division, which is now operated as a separate unit elsewhere, to cost more than $60,000.

Bull Dog Electric Products Co., 7610 Joseph Campau Avenue, Detroit, manufacturer of electric switches and kindred products, is said to be planning new one-story machine shop, to cost about $45,000 with equipment.

Battle Creek Gas Co., Battle Creek, Mich., has awarded general contract to S. B. Cole & Son, Inc., local, for three-story and basement equipment storage and distributing plant, 95 x 100 ft., with repair division, to cost about $140,000 with equipment.

State of Michigan Boys' Vocational School, 400 North Pennsylvania Avenue, Lansing, will soon take bids for two-story vocational school, to cost about $200,000 with equipment. Bowd & Munson, Wilson Building, are architects; McColl, Snyder & McLean, Penobscot Building, are mechanical engineers.

Wolverine Bolt Co., 9660 French Road, Detroit, has asked bids on general contract for one-story plant unit, to cost about $70,000 with equipment. D. B. Ireland is secretary and treasurer.

Detroit Stoker Co., General Motors Building, Detroit, is said to be planning a two-story addition to plant at Monroe, Mich., to cost about $30,000 with equipment.

Department of Public Lighting, 174 East Atwater Street, Detroit, has awarded general contract to Gallagher & Fleming Co., 6500 Epworth Boulevard, for one-story equipment storage and distributing plant, to cost about $34,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects.

Buffalo

BUFFALO, Sept. 16.—National Lime & Cement & By-Products Corporation, Stock Exchange Building, Buffalo, will soon break ground for new plant near Tuscumbia, Ala., for lime production. Project will include large crushing plant, and will cost more than $200,000 with machinery. Soule & Zepp, 507 North Charles Street, Baltimore, are consulting engineers. Thomas K. Morris is vice-president.

North American Lloyd Aircraft Corporation, 535 Fifth Avenue, New York, has plans for airport at Jamestown, N. Y., including hangar, with repair facilities and other buildings, to cost about $100,000 with equipment. F. D. Amory, Jr., 551 Fifth Avenue, New York, is architect.

Brewer-Tichenor Corporation, Cortland, N. Y., manufacturer of automobile equipment and accessories, has awarded general contract to Austin Co. for one-story addition, to cost about $50,000 with equipment.

American LaFrance-Foamite Corporation, Elmira, N. Y., manufacturer of fire engines, trucks, etc., has asked bids on general contract for one-story addition, to cost about $55,000 with equipment. Haskell & Considine, Hulett Building, are architects.

Department of Public Works, Municipal Building, Buffalo, will soon begin construction of municipal marine airport, including shops for repair and reconditioning, to cost about $150,000 with equipment. Col. Howard Beck, Huyler Building, is city architect.

Cleveland

CLEVELAND, Sept. 16.—The machine tool market was rather quiet the past week, in both orders and inquiries. There is increasing evidence that prospective business is being held back until after the Machine Tool Builders' Exhibition to be held in Cleveland the week of Sept. 30, and a further tapering off is looked for during the remainder of the month. Machine tools and other equipment shown here last week at the National Metal Congress attracted much interest and resulted in the placing of a number of orders.

Champion Machine & Forging Co., Cleveland, has awarded a contract for a boiler house which is first unit of a large addition. A 1000-hp. boiler and auxiliary equipment will be installed.

National Screw & Mfg. Co., Cleveland, will erect an addition to its Grant Avenue plant.

Contract has been let by Gluntz Brass Foundry Co., East 108th and Harvard Avenues, Cleveland, to J. H. O'Grady, 2008 Rosamer Road, for one-story machine shop, to cost about $35,000 with equipment.

Firestone Tire & Rubber Co., Akron, Ohio, has awarded general contract to Burger Iron Co., Akron, for seven-story addition, 110 x 180 ft., to cost about $750,000, of which about $350,000 will be expended for equipment.

Electric Products Co., 1725 Clarkstone Road, Cleveland, has awarded general contract to A. M. Higley Co., Plymouth Building, for two-story addition, 80 x 100 ft., to cost about $60,000 with equipment. H. M. Morse Co., 750 Prospect Street, is architect and engineer.

City Council, Painesville, Ohio, has plans for extensions and improvements in municipal electric light and power house, including installation of 2500-kw. turbo-generator and auxiliary equipment, to cost about $75,000. Hadlow, Hughes, Hick & Conrad, Inc., 850 Euclid Avenue, Cleveland, is engineer.

Colonial Iron Works Co., 17643 St. Clair Avenue, Cleveland, has plans for one-story addition, 100 x 150 ft., to cost about $55,000 with equipment.

Westinghouse Electric & Mfg. Co., East Pittsburgh, has purchased Bissell Electric Co., Toledo, Ohio, and will operate as unit, primarily for storage and distribution.

Sands Mfg. Co., 5407 Sweeney Avenue, Cleveland, manufacturer of water heaters, etc., has awarded general contract to Bolton-Pratt Construction Co., Columbia Building, for one-story addition, 65 x 70 ft., to cost about $45,000 with equipment.

Indiana

INDIANAPOLIS, Sept. 16.—Contract has been let by American Coating Mills Co., Division Street, Elkhart, to George C. Kistner, 514 South Main Street, for one-story addition to paper mill, to cost about $40,000 with equipment.

Indianapolis Cage Corporation, Indianapolis, recently organized with capital of $50 000 to manufacture bird cages and stands and other metal products, will operate a factory at Seventeenth Street and Kent Avenue. Benjamin D. Aufderheide is one of heads of company.

Board of Education, Terre Haute, is considering installation of manual training equipment in two-story and basement addition to McLean Junior High School, to cost $200,000. George J. Stoner & Co., Chamber of Commerce Building, are architects.

Northern Indiana Public Service Co., Hammond, has arranged for a bond issue of $15,500,000, part of fund to be used for extensions and improvements in plants and system.

Bendix Brake Co., South Bend, manufacturer of four-wheel brakes for automobiles, has awarded general contract to H. G. Christman Co., 306 South Notre Dame Street, for two-story and basement addition, 42 x 150 ft., to cost about $45,000 with equipment.

Traveling ovens, power equipment, conveying and other machinery will be installed in one-story and basement plant, 135 x 158 ft., to be built by General Baking Co., 420 Lexington Avenue, New York, at Indianapolis, for which contract for superstructure has been let to W. B. Bellows Construction Co., Oklahoma City, Okla., to cost about $200,000. Archer & Gloyd, Inc., Pioneer Trust Building, Kansas City, Mo., are architects.

Firestone Tire & Rubber Co., Akron, Ohio, has plans for multi-story factory branch, storage and distributing plant at Kokomo, to cost about $80,000 with equipment. Bishop, Knowlton & Carson, 312 North Meridian Street, Indianapolis, are architects.

International Fork & Hoe Co., Fort Wayne, has leased buildings and equipment of Sperry Mfg. Co., New Haven, Ind., and will manufacture farm and garden implements and tools. H. E. Frame, formerly with National Handle Co., Fort Wayne, will be in charge.

Haynes Stellite Co., Kokomo, Ind., is taking bids for a new foundry and expects to be in production about Jan. 1. A warehouse will also be erected.

Quaker Maid Co., Terre Haute, has broken ground for group of buildings to cost $750,000. General contract has been awarded to Thomas A. Moynahan Co., Indianapolis.

Gulf States

BIRMINGHAM, Sept. 16.—Work will soon begin by Kansas City Southern Railway Co., Kansas City, Mo., on shops for new terminal at Beaumont, Tex., to include engine house, locomotive repair shops, machine shops and other units, entire project to cost about $1,000,000 with equipment.

Texas Machine & Foundry Co., Rigsby Street, San Antonio, Tex., has plans for two one-story machine shops, to cost about $30,000 with equipment.

E. G. Beaumont, formerly president and general manager of H. L. Wilson Hardware Co., Beaumont, lately acquired by Peden Iron & Steel Co., Houston, Tex., has awarded general contract to Christy-Dolph Construction Co., Beaumont, for one-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Orient Petroleum, Harvey-Snider Building, Wichita Falls, Tex., will soon begin extensions and improvements in local oil refinery, including installation of equipment for gasoline production, to cost about $500,000. Company is a subsidiary of Atlantic-Pacific & Gulf Oil Co., Kansas City, Mo.

Swift & Co., Chicago, have plans for three-story meat-packing plant at Paris, Tex., with installation of refrigerating equipment, conveying and other equipment, to cost about $150,000.

Aero & Auto Engineering Co., Tampa, Fla., F. L. Ludwig, general manager, has leased 40-acre tract in Hillsborough Bay district, for establishment of flying school and airport, including hangars, repair shops, oil storage and other units, to cost about $100,000 with equipment.

Board of Education, San Antonio, Tex., is considering installation of manual training equipment in new three-story high school, to cost $160,000, for which plans have been completed by Harvey P. Smith, National Bank of Commerce Building, architect; W. E. Simpson Co., Milam Building, is engineer.

Texas & Pacific Railroad Co., Dallas, Tex., has begun grading site for engine terminal at Big Spring, Tex., and will start work on group of 13 one-story buildings in about 90 days, including engine house, machine shop, forge shop, locomotive boiler and plate shop, power house and other units, entire project to cost more than $400,000 with equipment. E. F. Mitchell is chief engineer.

American Cast Iron Pipe Co., 2930 North Sixteenth Street, Birmingham, has filed plans for two one-story additions, to cost about $45,000 with equipment.

Louisiana Ice & Utilities Co., Inc., Alexandria, La., has plans for three-story ice-manufacturing and refrigerating plant, including car-icing division, to cost about $100,000 with equipment. Samuel Stone, Jr., & Co., Masonic Temple, New Orleans, are architects.

Bent Concrete Pipe Co., Grosse Building, Los Angeles, manufacturer of reinforced concrete pipe, has begun initial building for new plant at West Dallas, Tex., where 10-acre tract was recently acquired, to cost $100,000 with equipment. Other units

will be built later, entire project to cost over $500,000.

Rio Grande Oil Co., 525 East Seventh Street, El Paso, Tex., has plans for new refinery adjoining present plant, to cost more than $500,000 with machinery.

Cincinnati

CINCINNATI, Sept. 16.—Although demand for heavy machines continues fairly brisk, district manufacturers report a slight recession in the call for light tools. In fact, one leading maker of lathes indicates that fresh bookings the past week declined noticeably. Builders of planers, boring mills and similar tools, however, report that orders so far this month are in greater number than in the same period last month and in some instances total more than the entire month of August. Nevertheless, the number of unfilled orders is still large, some manufacturers having sufficient business booked to maintain present rate of production the remainder of the year.

American Bridge Co., Pittsburgh, is in the market for four planers and the Niagara Machine Tool Co., Niagara Falls, N. Y., is inquiring for one large planer. The Big Four Railroad has placed an order with a local manufacturer for a 16-in. and a 36-in. lathe for its Louisville shops. Westinghouse Electric & Mfg. Co., and Edward G. Budd Mfg. Co., of Philadelphia, have each closed for one 60-in. planer. Hershey Lumber Co., Hershey, Pa., has ordered a 24-in. planer and United Fruit Co. has purchased a 36-in. planer for shipment to Cuba. A German company has placed an order with a local manufacturer for two 16-in. automatic lathes.

Delco Products Co., Dayton, Ohio, manufacturer of isolated electric lighting plants, electric lighting and starting equipment for automobiles, etc., is planning expansion, including five-story factory unit to cost about $200,000 with equipment.

Burkett Closed Body Corporation, 541 Master Avenue, Dayton, Ohio, manufacturer of automobile bodies, is contemplating erection of new plant, to cost more than $100,000 with equipment.

Standard-Coosa-Thatcher Co., Chattanooga, Tenn., manufacturer of textile products, has begun work on one-story machine shop for repair work and parts replacements, to cost about $45,000 with equipment.

Plough, Inc., 121 South Third Street, Memphis, Tenn., manufacturer of industrial chemicals, etc., has asked bids on general contract for five-story plant to cost about $1,000,000 with machinery. Hanker & Cairns, Court Square Building, are architects.

International Derrick & Equipment Co., Columbus, Ohio, has purchased Boykin Machinery & Supply Co., Beaumont, Tex., and will expand and operate as unit of organization. B. Boykin, Jr., will be vice-president and general manager.

Model Milling Co., Johnson City, Tenn., is contemplating erection of new grain elevator and feed milling plant, including installation of elevating, conveying, screening and other equipment, to cost more than $250,000. George L. Carter is head.

Master Electric Co., Linden Avenue, Dayton, Ohio, manufacturer of electrical equipment, is clearing site for additions, one unit to be used for foundry, entire project to cost about $200,000 with equipment. E. A. Hart, Third National Bank Building, is architect.

Ideal Foundry & Machine Co., recently organized, is operating a foundry at 900 Albany Street, Dayton, manufacturing light gray iron and semi-steel castings. J. M. Conroy is president.

St. Louis

ST. LOUIS, Sept. 16.—Plans are under way by Glasco Electric Co., Kansas City, Mo., care of Victor J. DeFoe, 114 West Tenth Street, architect, for one-story plant, 100 x 110 ft., to manufacture electrical equipment, to cost more than $40,000 with equipment.

Ace Automatic Machine Corporation, Kansas City, Mo., care of James W. Johnson, 5421 Montgall Street, recently formed by Mr. Johnson and associates, plans operation of factory to manufacture coin-operated machines, including patented moving target machines, parts, etc.

Board of Education, East St. Louis, Ill., has plans for two and three-story junior high school and has authorized group of shops for manual training, to cost more than $300,000. W. J. Kennedy, First National Bank, East St. Louis, is architect; N. S. Spencer & Son, 180 North Michigan Avenue, Chicago, are associate architects.

Western Air Express, Inc., 117 West Ninth Street, Los Angeles, will carry out expansion at airport at Alva, Okla., to include construction of hangar, 100 x 120 ft., with repair and reconditioning shop facilities and other structures, to cost over $70,000.

Packard Motor Car Co., East Grand Boulevard, Detroit, has plans for three-story service, repair and garage building at Kansas City, Mo., to cost over $175,000 with equipment.

Shaffer Specialty Co., 113 South Denver Street, Tulsa, Okla., manufacturer of mechanical equipment, has awarded general contract to Oklahoma Building & Investment Co., Boston Building, for one-story machine shop, 50 x 100 ft., to cost about $28,000 with equipment.

City Council, Seminole, Okla., is planning a municipal electric light and power plant, using Diesel engine-generator unit, to cost $65,000 with equipment. R. N. Green, Seminole, is engineer.

De Camp Consolidated Glass Casket Co., Muskogee National Bank Building, Muskogee, Okla., is planning three-story addition, 75 x 150 ft., to cost about $50,000 with equipment.

Nebraska Power Co., Electric Building, Omaha, Neb., is planning addition to local steam-operated electric power plant, to cost about $100,000 with equipment.

Northwestern Iron & Metal Co., 910 T Street, Lincoln, Neb., has awarded general contract to W. J. Assenmacher Co., 625 North Seventh Street, for one-story and basement storage and distributing plant, 50 x 140 ft., to cost about $25,000 with equipment.

Oklahoma Gas & Electric Co., Insurance Building, Oklahoma City, Okla., has plans for a steam-operated electric generating plant unit at Belle Isle Park, near city, to cost about $800,000. Byllesby Engineering Co., 231 South La Salle Street, Chicago, is engineer.

Multiplex Faucet Co., 4325 Duncan Avenue, St. Louis, manufacturer of special beverage dispensing equipment, is erecting a third story on its two-story plant, with investment of $18,000 in building and equipment.

Central Brass & Aluminum Foundry Co., Twenty-first and Randolph Streets, St. Louis, is erecting a one-story addition, 33 x 59 ft., to cost $4,000.

Universal Vapor Spray Mfg. Co., Inc., 308 North Robinson Street, Oklahoma City, Okla., has awarded contract to Morris Mfg. Co., El Reno, Okla., for manufacture of metal vegetable display racks to be sold by former.

Milwaukee

MILWAUKEE, Sept. 16.—A slight decrease in the volume of machine tool sales is noted, notwithstanding peak production in almost all metal-working industries. Inquiries are larger compared with recent weeks. Employment figures show an increase of about 15 per cent over last year's totals and no decrease from the July high mark.

Demand is steady from manufacturers of power producing and transmission equipment, agricultural implements and automobile parts and accessories, but automobile manufacturers have not yet entered this market to any great extent. Sale of used tools is increasing.

Rundle Mfg. Co., Milwaukee, manufacturer of plumbing supplies and enameled sanitary ware, has begun work on new storage yard to cost about $75,000, including conveyors and other equipment. A. A. Wickland & Co., Chicago, are consulting engineers.

United Iron & Metal Co., Milwaukee, will have a new plant, office and shop built by Paul Realty Co., local, to cost about $40,000 complete.

Board of Vocational Education, Racine, Wis., is asking bids on plans by Frank J. Hoffman, architect, James Block, local, for new vocational school, three stories, 68 x 128 ft. T. S. Rees is director.

Board of Regents, University of Wisconsin, Madison, has let contracts for mechanical engineering building to J. H. Findorff & Son, local. It will be three stories, 230 x 230 ft., irregular. Plans are by Arthur Peabody, Madison, State architect.

Pacific Coast

SAN FRANCISCO, Sept. 12.—Contract has been awarded by Port Stockton Cement Co., Claus Spreckels Building, San Francisco, to MacDonald Engineering Co., 149 California Street, for new mill at Stockton, Cal., to cost over $1,000,000 with equipment. E. A. Roberts and W. C. Stevenson are company engineers.

Fresno Auto Body & Fender Works, Inc., 1919 Calaveras Street, Fresno, Cal., has plans for new one-story plant, to cost about $50,000 with equipment. E. J. Kump Co., Rowell Building, is architect.

Warman Steel Casting Co., 6100 South Boyle Avenue, Vernon, Cal., has filed plans for a one-story foundry addition, including crane runway.

Anderson Barngrover Mfg. Co., West Julian Street, San Jose, Cal., manufacturer of fruit-handling and kindred machinery, has plans for a one-story unit, 85 x 215 ft., for assembling, to cost about $50,000. Charles McKenzie, Towhy Building, is architect.

Crown Willamette Paper Co., 248 Battery Street, San Francisco, has plans for new unit for production of bleached pulp at Camas, Wash., in connection with an

expansion program at plant, to cost more than $3,000,000 with equipment.

Paper Makers' Chemical Co., Kalamazoo, Mich., manufacturer of industrial chemicals, has engaged Austin Co., Portland, Ore., to prepare plans for new plant on 7-acre tract, recently acquired in Guilds Lake district, Portland, to cost about $275,000 with equipment. W. J. Lawrence is president.

Salinas Cold Storage Co., Monterey, Cal., has plans for new cold storage and refrigerating plant at Castroville, Cal., to cost about $200,000 with machinery. Engineering department of company is in charge.

Durant Motor Co. of California, Inc., East Fourteenth Street, Oakland, Cal., has filed plans for a one-story addition, to cost about $60,000 with equipment.

Aircraft Industries, Inc., San Francisco, recently organized by G. L. Bush, president of Bush Electric Co., San Francisco, and W. F. Beard, Modesto, Cal., is planning construction of new aircraft manufacturing plant near Waterford Road, Modesto, with units for parts production and assembling, to cost about $65,000 with equipment.

Spring Street Iron Works, Klamath Falls, Ore., will erect a new plant, 99 x 154 ft., to replace a structure recently destroyed by fire. Completion is scheduled within two months.

Pacific Rockwood Co., Central Building, Seattle, Wash., has been incorporated to acquire local business of Rockwood Sprinkler Co. and to conduct a general fire protection equipment contracting business. Company is in market for all classes and types of iron pipe and fittings, valves, etc. B. H. Lewis is president.

Canada

TORONTO, Sept. 16.—General Motors of Canada, Oshawa, Ont., will start work within two weeks on erection of a parts and service building three stories and basement, with floor space of about 87,000 square feet.

Skinner Co., Ltd., Gananoque, Ont., manufacturers of automobile bumpers, etc., has awarded general contract to Ferguson Contracting Co., Ltd., Confederation Life Building, Toronto, for plant at Oshawa, Ont. Equipment has not yet been purchased.

Standard Brick Co., Ltd., Toronto, has purchased seven acres near Oshawa, and expects to start work at once on erection of a plant.

Steel Equipment Co., Ltd., 360 Steel Street, Pembroke, Ont., has awarded contract to Walter Beatty Esate, 125 Pembroke Street, for an addition to cost $30,000. J. A. Ewart, Jackson Building, Ottawa, is architect.

United Mfg. Co., 1470 Peel Street, Montreal, has plans for a three-story manufacturing building at Cap de la Madeleine, Que., to cost $50,000.

Construction has been started on a beaver board plant at Donnaconia, Que., for Price Brothers Co., Ltd., to cost $1,000,000. Main building will be two stories, 150 x 400 ft.

Western Canada

Western Foundries, Ltd., has purchased a four-acre site at Lethbridge, Alberta, and is erecting a plant to manufacture highway machinery, oil and mine drilling equipment, cast iron water pipe, brass and bronze castings, etc.

Contracts will be awarded soon by Dominion Bridge Co. for construction of its structural steel fabricating plant on 38-acre site at Burrard Inlet, Vancouver, B. C. It will be electrically operated and will cost $1,500,000.

Foreign

EXPANSION in manufacturing is planned by Columbia Graphophone Co., Ltd., London, England, covering production of radio equipment and sets. Investment for manufacturing facilities during next 12 months is estimated at more than £500,000 (about $2,500,000). L. S. Sterling is managing director.

Soviet Precision Machinery Trust, Soviet Russian Government, Moscow, represented by Amtorg Trading Corporation, 261 Fifth Avenue, New York, will build a plant at Moscow to manufacture American type dollar watches and alarm clocks. Negotiations have been completed for purchase of machinery at plants of Dueber-Hampden Watch Co., Canton, Ohio, and Ansonia Clock Co., 397 Seventh Avenue, Brooklyn, N. Y., which will be shipped to new plant site at once; additional equipment will be provided for large capacity.

C. E. Matens, head of Mejia, Ray & Co., Bogota, Colombia, importers of mechanical equipment, etc., is planning expansion and is desirous of getting in touch with American manufacturers of road-building machinery, agricultural and woodworking machinery, hardware products, electrical fixtures, etc.

Burmeister & Wain Shipyard, Copenhagen, Denmark, has arranged for increase in capital from 30,000,000 to 35,000,000 kroner (about $8,350,000) part of proceeds to be used for expansion.

Credito Nacional Peninsular y Americano, Madrid, Spain, operating oil properties, has purchased plants and oil lands of Falcon Oil Corporation in Lake Maracaibo district, Venezuela, including concessions for 293,000 acres in section noted, as well as 93,000 acres in State of Monagas, eastern Venezuela. Acquired company has output of about 4000 bbl. daily, and increase in output is planned.

Reynaldo Yruegas, Hidalgo 108, Lampazos, N. L., Mexico, is in the market for 1 and 2-hp. motors of American manufacture, also for an isolated electric-lighting plant.

New Trade Publications

Crawler Equipment.—Northwest Engineering Company, 28 East Jackson Boulevard, Chicago. Catalog of 100 pages with many illustrations in color of the use of shovels, drag lines, pull shovels and skimmer-scoops. Also contains details of construction and assembly of the various types of machines and describes gasoline and electric power plants used in this equipment. Complete tables are included, giving operating ranges, crane lifting capacities and clearance diagrams.

Compression Resistors and Controllers.—Allen - Bradley Co., Milwaukee. Eight - page leaflet describing the organization and development of this company, the manufacture of graphite disks, descriptions of mechanical and electrical departments, as well as the research division and an outline of employee welfare activities.

Steel Castings.—Farrell-Cheek Steel Foundry Co., Sandusky, Ohio. A very attractive 16-page bulletin describes "Farrell's 85 Cast Steel." It is profusely illustrated, showing different types of castings, in which this special steel of high tensile strength and yield point in five different grades, is incorporated. The products include digger teeth; bucket parts; tooth gears and pinions, as well as wheels; sprockets, sheaves and rollers; crawler and accessory parts, and miscellaneous castings. The superior properties claimed for this steel in the various parts mentioned are discussed.

Steel Castings.—Sivyer Steel Casting Co., Milwaukee. A four-page illustrated leaflet describes in particular electric alloy trusswheels, known as Athey, for the use of transporting large trees in the Redwood forests of California.

Perforated Metals.—Hendrick Mfg. Co., Carbondale, Pa. A catalog of 60 illustrated pages describes elevator buckets, troughs, flights and other perforated articles made by the company from light and heavy steel plate. A mass of technical data relating to the methods of measuring perforations, as well as tables of sheet and plate steel gages, weights of sheet metals and other measurements, is given. The catalog is well indexed.

Recording Psychrometers. — Bristol Co., Waterbury, Conn. The recording psychrometers described in a 16-page catalog consist of two complete recording thermometer systems, including two sensitive bulbs and two penarms mounted together in one case and arranged to record on one chart. The catalog also contains a number of chart ranges with specimen scale for use with type instruments. A relative humidity table is published.

Power Plant Construction.—Morton C. Tuttle Co., Boston. Four-page folder illustrating work being done on the Kennebec River in Maine, adding 100,000 hp. to the power lines of the Central Maine Power Co.

Centralized Lubrication. — Lubrication Devices, Inc., Battle Creek, Mich. Booklet of 16 pages illustrating and describing the Farval positive centralized system of lubrication. Many of the illustrations are from applications in industry, and the showing is impressive as to diversity and also as to the sizes of some of the units served. Stress is laid upon the saving in labor of attendance.

Firebrick. — Laclede-Christy Clay Products Co., St. Louis. Four-page folder devoted to refractories and their production and handling in the plant of the manufacturer.

Flood Lights. — Crouse-Hinds Co., Syracuse, N. Y. Four-page folder on flood lights for a wide variety of uses. The housing is of cast aluminum alloy, said to be unaffected by salt atmospheres and incorrodible.

THE IRON AGE

New York, September 26, 1929

ESTABLISHED 1855 VOL. 124, No. 13

Development More Urgent Than Research

Small Concern Can Perfect Applications of Facts Made Known by Another's Research If Engineer of Sufficient Inventive Ability Is Available

BY L. A. TROFIMOV*

At the time when engineering became a recognized profession it had but two divisions, namely, military and civil engineering. Civil engineering included all that was known about engineering. But the scope of engineering soon became so large that it was forced to subdivide. At the end of the eighteenth century machine inventions and uses gave rise to mechanical engineering. The rapid development in the manufacture of iron and other metals led to the differentiation of metallurgical and mining engineering. More recent developments in electricity brought forth electrical engineering, and wide application of chemistry produced chemical engineering.

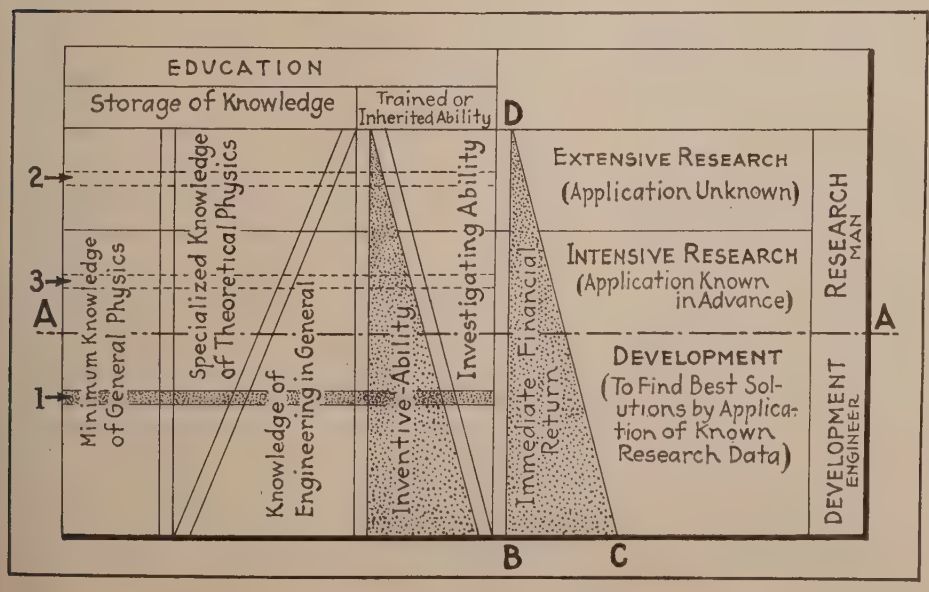
During the last decade another differentiation in an entirely different plane may also be observed. It is based on the *kind* of ability required in engineering work. The results of this differentiation are the occupations of "research men" and "development engineers." These men obtain or apply information from any or all the above mentioned branches of knowledge.

*Development engineer, Electric Controller & Mfg. Co., Cleveland.

Development Has Made Research Popular

Research and development are closely associated in practice but differ fundamentally in their nature. Due to the fact that these two activities are new, there are divergent views regarding their nature and proper place in industry. For instance, it is not clearly understood that *development* is responsible for the popularity of research. As a matter of fact, research data have no value in industry unless they can be profitably applied to manufacturing. Obtaining research data and applying the facts are two fundamentally different functions requiring different technique, different education and different types of mind.

Judging by the numerous articles about research, the presence and importance of the so-called research engineer is quite established; the presence of the development engineer and the development department has passed al-



IN the Upper Reaches of the Diagram Are the Qualities of the Research Man, While in the Lower Are Those of the Development Engineer

most unnoticed, owing to the fact that research and development are closely associated, and functions of development are frequently misnamed research. Some have, therefore, assumed that industry needs more research men while actually it needs development engineers. As will be seen later, there are no difficulties in supplying the former if industry wants more, while there are as yet no sources for the supply of the latter.

Research Differentiated From Development

THE word research was introduced into industry from the realm of science and simply means search again. Research, obviously, has been supplying working material for science. When the manufacturer found it profitable to undertake some research in his factories, he distinguished it from the work that had previously been conducted in colleges and governmental institutions by the term "industrial research." There is no marked difference between industrial and scientific research except in restriction and purpose. Thus, scientific research is the process of collecting facts on phenomena of nature and on relations between them, with no immediate practical application in view; on the other hand, industrial research is a similar search in a specified field with definite practical application in view.

The *nature* of research is best characterized by the word discovery, that is, to find something that always existed but was not known. The *function* of research is to search nature for something new. It may be a new element or combination of elements, a new substance, or an unknown law, or better information on laws of nature and relations between them. Therefore the functions of the research man are similar to those of an explorer, investigator or true scientist.

The best research mind is of the single-track type, capable of persistent and deep efforts for exploring the unknown. A detailed and profound knowledge of the field under investigation is necessary. The training of research men must be the same as that of the physicist who specializes in one of the branches of his science and has a general knowledge of research technique. The present system of college education is capable of producing as many research men as industry needs.

There is a greater need of capable men for applying research to industry. This does not mean that the research man is incapable of applying his findings—of course he does so if he happens to possess such an ability. But in doing so he performs an act which in itself is fundamentally different from research, and may be correctly described by the word invention. The distinction between discovery and invention lies in the fact that the first always existed, while the second comes into existence by the creative faculty of the mind. Therefore, we may define the development engineer as an "industrial inventor."

Now and then one person may possess both investigating and inventing ability and perform the functions of both the research man and the development engineer. But with the growth of industry the scope of each activity broadens to such an extent that it becomes difficult and inefficient to assign both functions to one person. Both research and development departments may therefore be found in some industries. As mentioned above, the writer has the opinion that there is no difficulty in producing research men in our present colleges.

But in producing development engineers, we deal chiefly with inventive ability, which, it is assumed, is beyond our control. Experience seems to show that a man with good knowledge of general physics makes a better development man than a physicist specialized in one branch. Furthermore, a man who knows the fundamentals of several engineering branches is better than an expert. If we add to this a knowledge of development technique, we have the outline of the kind of education he must have. The present educational systems do not produce engineers of this kind and there is no source of obtaining them except by accidental selection.

Mental Equipment of Specialized Workers

THE diagram may help in understanding the subject we are discussing. It represents graphically the general mental characteristics of the typical research man at the top of the diagram; note how they gradually change into those of the ideal development engineer at the bottom.

In this diagram the amount of knowledge of general physics is assumed to be the same, and is the minimum that any man engaged in research or development must have. The distribution of the balance varies with the level on the diagram. Horizontal strip 2 taken in the upper quarter will represent a research man, highly specialized perhaps in one branch of physics, with very little engineering knowledge, possessed by little inventive ability but with highly developed faculties of investigating and generalizing. This type of man is best fitted to do research into fields of science, with no immediate practical application in view but with the purpose of expanding the knowledge on which the industry is based, expecting that proper application will be found in the future.

Strip 3, taken in the second quarter from the top, may represent a somewhat different type of research man. His knowledge of theoretical physics is not so extensive; instead he knows more about engineering and he possesses some degree of inventive and investigating ability. He is best fitted to do intensive research, where the application of his findings is known in advance. His work should best be confined to a definite field, for the immediate object of improving, cheapening, or extending the application of process or products. A man engaged in such work must know enough engineering to guide his research in the proper direction, and must possess some inventive ability to apply in the best way the results of his research.

Development Engineers Are Inventors

The lower half of the diagram represents development engineers. They solve industrial problems by applying known research data. They do some research themselves, but their chief effort is exerted through their inventive ability. The diagram should have no precise demarkation between the research man and development engineer, but we may assume it to be somewhere about line *AA*. The stores of knowledge and the qualities of mind are distinctly different.

Triangle *BCD* approximately represents the immediate financial returns from investment in research and development. This triangle is similar to the one representing inventive ability. It illustrates the fact that research is of value to industry only as it is applied.

Small Concerns Can Do Development Work

TO show the proper place of development departments, take two examples, one of large industry with a considerable variety of products, and the other of small industry with only one or two products.

The former can afford to maintain research departments where both scientific and industrial research are done, because such industry, covering a wide field and a variety of products, can usually get direct financial return on the research budget. There must also be a development department whose chief function is to find the best applications of the findings of research. This includes conceiving ideas of solutions or applications, experimenting, designing, constructing, testing and advising production.

The small industry cannot afford to maintain research

departments and has to be content with published data. This cannot be properly considered as a great handicap, because, as we know, all new findings of research become known after their first practical application, which is never the best. Proper development departments of any small industry may and usually do find better use of another's discoveries. If this were not true, small industries with no research departments would pass out of existence; as a matter of fact, they do not.

Therefore, small industries with a limited variety of products should have development departments for the purpose of enlarging their sales, through the best application of published research data. The functions of these departments should be the same as those in the large industry. There will even be a little research carried on in a small plant because existing and available information on a certain narrow branch of physics is not always sufficient.

Even a superficial observation of various industrial organizations strongly indicates the tendency toward definite separation of development departments from research departments, assigning functions to each of them as indicated above. In other words, we are observing a further differentiation in the engineering profession; development engineering is now at the place where it is waiting for attention from the colleges. Before the colleges can help industry, however, the functions characteristic of development engineering must be clearly set forth, and the technique of development work must crystallize itself. Then the colleges will be enabled to select and train men for the profession of development engineering.

Electrochemists Meet in Pittsburgh

Annealing Brass and Copper—Symposium on Electrochemistry in Aeronautics—New High-Frequency Furnace Described

AMONG its many successful general conventions, the annual fall meeting of the American Electrochemical Society at Pittsburgh last week, Sept. 19 to 21, was one of the most important and most largely attended. It was the fifty-sixth general meeting, held under the auspices of the Pittsburgh section at the William Penn Hotel. Registration was over 250 with actual attendance at least 350, many not registering.

This society has an enviable reputation for the symposiums it has arranged. This fall the feature was one on "Contributions of Electrochemistry to Aeronautics." Nine papers were presented and the discussion was ample. Many new developments were brought out and future trends outlined. The symposium is reviewed on other pages.

Round table discussions of live electrochemical topics are also a feature of this society's work. It originated the first meeting of this nature at its Dayton, Ohio, spring meeting in 1924. Another one, devoted to "Recent Developments in the Annealing of Non-Ferrous Metals," was on last week's program. There were also for the first time parallel sessions on two days at which many miscellaneous papers were scheduled. In all 36 papers were delivered and discussed at five sessions. Several were on the subject of chromium plating.

Furnaces for Melting and Annealing

SOME important subjects were discussed at the informal session devoted to electric annealing of non-ferrous metals. One was the description of a new high-frequency electric melting furnace and the other some data, offered as a printed paper. on vacuum furnaces with carbon resistor tubes.

New High-Frequency Furnace

A FURNACE was described for the first time by Dr. P. H. Brace of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. The smallest unit practicable for commercial size which can be used with 60-cycle current is 750 lb., said Dr. Brace. In this new furnace as low as 125 lb. of steel has been melted at 60 cycles. Electrical efficiency is 75 to 80 per cent. It is possible to melt 400 lb. per hr. of chrome alloys poured as ingots with a power consumption of 650 kw.hr. per ton. In general, consumption will average 600 to 700 kw.hr. per ton.

Due to the stirring action in this furnace, melted alloys are nearly carbon free; there are no disseminated oxides and no inclusions. Crucible life with care can be 50 to 150 heats on a single lining. Practically no slag is necessary. The furnace is as nearly airtight as possible and ingots are poured straight from the furnace.

In cost and power consumption the furnace is approximately equal to a 3-ton arc furnace. Size for size, says the author, it will compete in cost and produce metal of better quality. The crucible is magnesite with clay bond.

In melting brass, the power costs are not so low as for the Ajax furnace. It has been used at the Westinghouse plant for 2½ years and has melted 1,000,000 lb. of brass on a graphite lining. Highest temperature is 1600 deg. C. It has melted pure iron and is ideal for refining with slags.

Electric Vacuum Furnace

AS the result of years of study on rendering metallic vapors luminous by "temperature radiation," two types of electric vacuum furnaces have been developed. These were described by Arthur S. King, head of the physical laboratory, Mt. Wilson Observatory, Pasadena, Cal., in a paper "The Design and Operation of Vacuum Furnaces with Carbon Resistor Tubes." High temperatures alone appear to be necessary to produce the large variety of spectroscopic phenomena observed. No definite type of chemical action has appeared to be necessary. The cylindrical and the hooded types of graphite resistor-tube furnaces each have a temperature range up to 3500 deg. C. Steady conditions of temperature and pressure are quickly reached, after which the light is permitted to pass to the spectrograph. An image of the interior of the tube is projected on the slit, light from the incandescent wall of the tube being excluded. The charge in the tube is vaporized, and the characteristic radiations of the vapor excited under close control of conditions. A long column of uniformly heated vapor is obtained. Various spectroscopic studies are described by the author.

Fuels for Annealing Brass and Copper

TO open the informal discussion on electric annealing of non-ferrous metals, Robert M. Keeney, Connecticut Electric Light & Power Co., Hartford, Conn., was selected. Mr. Keeney presented a valuable resumé of developments in annealing brass and copper with gas, oil, wood, electricity and so on.

In the order of their relative use, fuels for annealing

brass and copper are as follows: Oil, natural gas, wood, electricity, producer and city gas mixed. Oil and wood are largely used by Eastern brass and copper mills. For finishing stages, electricity is extending but at a slow rate in brass rolling mills—15,000 kw. are now used against only 3000 kw. last year. In many cases producer gas has been displaced by city gas.

Fuels for Bright Annealing

For bright annealing, electricity has been installed up to 7000 kw. recently. The two most important developments in the last two months have been (1) Replacing wood with city gas for annealing coiled sheets and so on; (2) Annealing with half natural gas and half city gas. In many cases electricity has not been adopted because a better finish in bright annealing is possible with gas, and rolling mill departments do not favor it without recuperation. Control of atmosphere with gas is claimed better than in the electric muffle, but a better product in bright annealing brass is possible with electricity, all things considered, said Mr. Keeney.

In bright annealing of copper, oil is used mostly in the East. For the bright annealing of tubing 4500 kw. are now used, and 12 to 13 lb. per kw.hr. is possible. In a pit type of electric furnace, filled with steam, 20 lb. per kw.hr. is done.

In nickel-silver for stampings or shells, electricity is replacing oil but gas is being introduced. In an electric hydrogen-filled furnace, the product is absolutely bright. For nickel-silver shells, gas has the upper hand. Gas is widely used in nickel rolling mills. For annealing aluminum, electricity is ideal, due to close temperature control.

In concluding Mr. Keeney declared that annealing in the non-ferrous industry is now more important than ever.

Bestowal of the Acheson Medal

AT an informal dinner, attended by about 150, the first presentation of the Acheson gold medal was made by President Frary of the society. Recently Edward G. Acheson established with the society a fund of $25,000 with which to present at suitable intervals a gold medal to the person who had contributed some outstanding achievement in electrochemistry. After careful deliberation, the board of directors of the society decided that the first medal could most appropriately be bestowed upon Mr. Acheson himself. It was recognized that his discovery some years ago of not only Acheson graphite but carborundum, both of which have resulted in large industries, merited some unusual recognition.

After considerable persuasion Mr. Acheson agreed to accept the first medal. Because of a recent minor operation, he could not be present in Pittsburgh to receive in person the medal. Dr. Frary announced, however, that he had appointed a committee to present the medal to Mr. Acheson at a suitable time and place in the near future. The committee consists of F. N. Becket, vice-president Union Carbide Co. and Electro Metallurgical Co., New York; Stanislaus Skowronski, research chemist, Anaconda Copper Mining Co., Perth Amboy, N. J., and Lawrence Addicks, consulting engineer, New York.

It is understood that the gold medal will be given by Mr. Acheson to the Smithsonian Institute to be placed among other medals of his with samples of original graphite and carborundum. He will retain a bronze replica. A telegram was received from Mr. Acheson expressing his regret at not being able to be present and declaring how difficult it was to record his appreciation of the honor.

A resolution of appreciation was offered by F. A. J. FitzGerald, president, FitzGerald Laboratories, Niagara Falls, N. Y., in respect to the cordial and efficient cooperation of the local section under the chairmanship of Charles A. Styer.

Seeing Tungsten Carbide Made

PLANT visitations were a feature of the convention. The Westinghouse Electric & Mfg. Co., East Pittsburgh, received a large delegation at luncheon and conducted the party through many of its departments. About 35 members made the trip to the Firth-Sterling Steel Co., McKeesport, Pa., and were received by the president, Lewis Firth, in his office. In the plant they saw in operation one of two Ajax-Northrup high-frequency furnaces, making a heat of high-carbon tool steel; a large 3-ton Heroult furnace, producing special tool steels, and a 5-ton circular tilting open-hearth furnace. The Heroult furnace is located on the site of the second furnace of this type which was built in the United States in 1908. The rolling mills were also visited.

One of the most interesting departments was the one where the company produces Dimondite, a tungsten-carbide cutting metal. Carbon, tungsten powder and cobalt are ground in special revolving cylinders to the finest possible powder. This mixture is then pressed into small bricks of suitable size and is sintered in special refractory furnaces in an atmosphere of hydrogen. The material is finally in shape for grinding to the proper form. Mr. Firth told some of his visitors that the tungsten-carbide industry was still in the experimental stage, similar to that of high-speed steel during the early days after the announcement of Taylor and White of their sensational discovery.

Next Convention

The next convention of the society will be held in St. Louis in the latter part of May, 1930, under the auspices of several prominent electrochemists in that city. This will be the annual meeting of the society. The next fall meeting will be in Birmingham, Ala.

Heat Treatment of Cast Iron

In a lecture delivered at Lille, Manager Godefroid of the Citroën laboratories gave the results of a series of experiments on the heat treatment of gray cast iron. The lecture has been reproduced in *La Révue de Fonderie Moderne* of July 25.

The experiments were carried out with cast iron of several analyses. Two of the more important are as follows:

Carbon, per cent	3.41	3.36
Silicon, per cent	2.17	1.78
Manganese, per cent	0.75	0.72
Nickel, per cent	0.38	0.30
Chromium per cent	0.12	0.07
Phosphorus, per cent	0.286	0.187
Sulphur, per cent	0.082	0.040

When reheated to between 700 and 750 deg. C., followed by air or water cooling, the Brinell hardness of such iron fell from 228 to 130, whereas when heated to above 800 deg. C. and cooled similarly the hardness increased with the temperature of the treatment to about 270 Brinell. A pearlitic structure was then evident. A troostitic structure appeared after a quench from 825 deg. C., and at 850 deg. and above the structure was martensitic with a hardness of 477 Brinell.

Further experiments with cast iron of other compositions showed equally important constructional and mechanical changes. It was emphasized that temperatures too high or too prolonged must be avoided as well as slow cooling, as these conditions encourage the development of graphite, while if the re-heating is greatly prolonged some of the graphite may be burned and replaced by oxides which give a very fragile structure. To soften cast iron, low temperature heatings are therefore recommended.

Steel Treaters Study Steel Melting

Slag Conditions, Electric Steel Castings and Melting Practice and Locomotive Forgings Covered by Four Notable Contributions

IN both quality and attendance the special session on Sept. 10 on steel metallurgy of the American Society for Steel Treating was highly noteworthy. It was four years ago in the same room in Cleveland that the first session of this scope was held, instituting a departure in the programs of the society. The eleventh annual National Metal Congress conducted by the society included this metallurgical session, which brought an audience of nearly 500 to the ball room of the Hotel Cleveland.

A brief summary of the papers and the many discussions are given in the following paragraphs:

Slags Govern Steel-Making Processes

A PAPER which was pronounced by several commentators as an outstanding contribution to the metallurgy of steel making was entitled, "Slags Produced in Steel Making, Their Effects on the Product and on the Process Itself," by George A. Dornin, Gathmann Engineering Co., Baltimore.

Particular attention was called by the author to the inevitable flaws and lack of uniformity that must follow in steel made by processes that attempt to finish and refine under slags carrying iron oxides. Slags, he contended, govern what the basic open-hearth process is capable of in making clean steel. Iron oxides are present in all finishing slags of all processes today, except the basic electric with its reducing calcium carbide slag. This is available only for high-cost operations. Acid slags are less oxidizing than basic but they have a limited field.

Reducing slags are not necessary, Mr. Dornin insisted, but the finishing slag must carry no oxides. He pointed out that the reduction of FeO in the bath can be accomplished more cheaply in a large way by the addition of deoxidizers. This must be done so that FeO is not fluxed out with the slag. The aim is the reduction of FeO to solid or gaseous non-metallics, the formation of self-fluxing non-metallics, with the probable result of speeding up the process and hence cutting down costs. "Give the basic open-hearth a chance—it makes about 85 per cent of the steel made."

Vacuum Melting Advocated

Slag changes suggested by the author are logical, said Dr. H. W. Gillett, director Battelle Memorial Institute, Columbus, Ohio. The removal of FeO dissolved in steel is analogous to the removal by ether of certain substances from a mixture. To avoid the necessity of self-fluxing or agglomeration, "let us consider how far we can go toward eliminating FeO by carbon, favoring that by vacuum. The best possible reduction product of FeO is CO, for this is a gas and it wants to come out. If we favor formation and elimination of CO by evacuation in the finishing furnace or ladle, we will be acting along the line of least resistance." Because one is not accustomed to vacuum finishing, the operation seems strange. Vacuum melting ought to be tried.

Making Two Slags Suggested

Final slags of an open-hearth furnace should be reducing, a condition impossible to achieve with the average slag in a basic furnace, said C. H. Elliott, Republic Iron & Steel Co., Warren (Ohio) Works. The author suggests the removal of the slag by emptying the furnace, probably into a ladle, and transferring the steel to a second furnace with the formation of a new reducing slag for finishing the heat. The main objection to this is the cost. Deoxidizers, to be allowed to function properly, should by all means be added in the furnace.

That basic open-hearth steel cannot be properly refined under normal operating conditions may seem rather a wide, sweeping statement to open-hearth operators, said Harry P. Evans, but "I shall leave it for them to discuss." A distinct advance in the art of steel making will result, if some auxiliary furnace or equipment can be obtained in connection with the open-hearth furnace that will produce economically a steel refined and deoxidized to the extent that is possible with the basic electric furnace, intelligently operated.

A heat of steel, in condition for final additions, is practically clean steel, in the opinion of Dr. R. H. Patch, E. F. Houghton & Co., Philadelphia. It is final additions, the tapping, pouring and pit conditions, which frequently are the cause of the verdict, "dirty steel."

Double Slags Advocated and Rejected

From a quality standpoint, one of the greatest advantages of the basic electric furnace is the ability to maintain a reducing slag which greatly facilitates the deoxidation and degasification of the metal during refining. This is the opinion of H. M. German, metallurgist, Universal Steel Co., Bridgeville, Pa., who said also that a different condition exists in basic open-hearth practice, as the slag after oreing is not removed and replaced with a refining slag. The basic open-hearth plan of practice, as suggested by Mr. Dornin, to separate the metal and slag after the oreing operation and to finish under a reducing refining slag, is feasible and would result in better quality steel, but it is not clear how he proposes to separate slag and metal.

That the direction of improvement of present practice

FOR Chairman of the Steel Session, the A.S.S.T. Secured the Services of Radclyffe Furness, Midvale Steel Co., Philadelphia, Who Has Had Wide Experience in Steel Making

is toward double slags, rehandling of steel, etc., was not agreed to by J. H. Flaherty. For special purposes and to meet special conditions, there may always be some advantage in double or triple slags, but because of operating costs the application will be limited. For real progress we must rather look, in large tonnages of basic open-hearth steel, to developments from fundamental researches in deoxidation which correlate laboratory findings with actual plant practices and results. Typical of this is the work of Dr. C. H. Herty, Jr., and his associates.

In the opinion of Prof. D. F. McFarland, Pennsylvania State College, State College, Pa., the author does not state what he considers the best composition for the non-oxidizing, non-reducing slag. Even if this were initially free from iron oxide, it is likely that FeO would be formed by oxidation of the bath during the change of slags and would be a factor in the situation. This FeO and that already dissolved in the bath would be subject to reaction both with the deoxidizing agent Si, Mn or Al, and with the oxides corresponding to these, and it is difficult to see how the latter relations can be avoided as is required in the author's last suggestion.

Double-Furnace Process Not Justified Always

Dr. C. H. Herty, Jr., vice-chairman of the steel session, declared that it is easy to skim slag from a small furnace but very hard from a large one. A double-furnace process will justify itself in many cases; there is such practice in Europe. But certain grades of steel do not need this extra refinement.

Electric Steel for Castings

BECAUSE a casting cannot be better than the metal from which it is produced, the methods applied in melting and finishing a heat of steel for castings must be considered as of primary importance. This is the contention of George Batty, research director, Steel Castings Development Bureau, Philadelphia, in his paper "Production of Electric Steel for Castings."

A definite boil in the bath of any heat is declared by Mr. Batty as essential—in the ordinary conditions in a steel foundry, where scrap contaminated with adherent sand is used as a part of the charge—in order that finely divided non-metallics be cleansed from the bath. There will be some inevitable elimination of carbon. To kill off the final traces of free and active oxide of iron in the bath with ferrosilicon is neither sound nor desirable practice.

A Gentle Boil Advocated

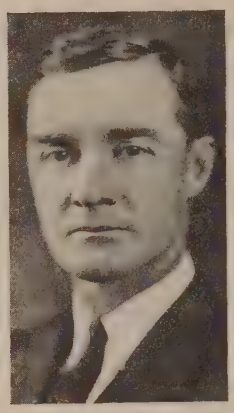
Most open-hearth and electric melters believe in a boil in the bath. A gentle boil, rather than an excessive one, was advocated by R. A. Bull, director, Electric Furnace Research Group. Iron ore is often added too late—how long it should be added before tapping is a question. In acid electric melting no ore should be added later than 45 minutes before tapping. Porosity in castings comes more often from mold conditions than metal.

Alumina is often pointed to as the main culprit in poor castings, said C. J. Comstock, metallurgist, Titanium Alloy Mfg. Co., Niagara Falls, N. Y. Frequently it is the case that differences in ductility are due to deficient arrangement of sulphide inclusions, according to careful microscopic analysis of many specimens. A plea is made for more careful inclusions—all inclusions are not alumina, nor all sulphides, nor all silicates.

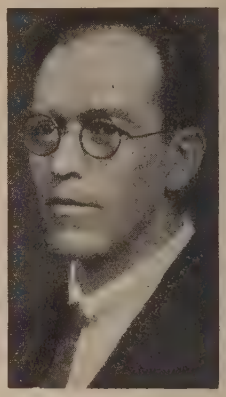
Low Carbon Favors Elimination of Inclusions

In reply to some of the views expressed, Mr. Batty said that the average melter will know when to use ore. Inclusions are usually eliminated earlier when carbon is low. A boil in the bath is essential but should not be excessive. Agreement with Major Bull was expressed as to late additions of iron ore or limestone, except in over-reduction. Pin holes are due to immigrant gases from the mold.

Authors of Papers on Steel Making



G. A. DORNIN



GEORGE BATTY

How to Make Good Locomotive Forgings

A NOTABLE contribution to the subject of locomotive forgings was the one on that subject by Lawford H. Fry, metallurgical engineer, Standard Steel Works Co., Burnham, Pa.

Making locomotive forgings which will give good results in service necessitates the employment of correct methods from the melting to the forging of the steel. Mr. Fry spoke of the various methods and precautions for accomplishing this, various steel making processes, and importance of ingot structure. The forging press and the resulting structures of steel forgings, and various types of forging steels were discussed, as well as the necessity for heat treatment. Physical properties which may be expected of steels were outlined.

Problems of producing and handling forgings so as to give constantly better and more reliable results in locomotive service concern both metallurgical and mechanical engineers and it is only by the fullest cooperation between producers and users that progress can be made. In choosing any of the special steels in an attempt to correct a definite type of trouble, as for example, axle failures occurring in the journal, all phases of the problem must be considered. If the failed axles show thermal cracks, it is evident that lubrication has been faulty, and it will be for engineering to correct this service condition by mechanical methods rather than to attempt to find some special steel which will operate successfully under unnecessarily difficult conditions.

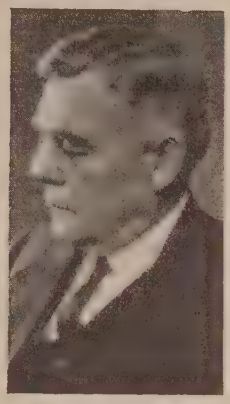
Locomotive forgings must encounter rough service and occasional abuse. It is to meet such conditions that the special normalized and tempered steels are being developed. It is now a question whether it is better to use a steel with high tensile strength or with high ductility. Both types are being tried. Time will bring further information.

Accidental Loads Serious

Discussion of Mr. Fry's paper was prolific. W. M. Barr, consulting chemist, Union Pacific Railroad, Omaha, Neb., said that discussion was not necessary, only emphasis on some points. Accidental loads on modern forgings become enormous—caused frequently by sudden shocks due to the breaking of parts. There is need for the highest quality of steel obtainable. The finest forg-

Presented Metallurgical Papers

H. P. RASSBACH



LAWFORD W. FRY

ings can, however, be ruined in machining. "Select your steel maker as you would your physician."

Vanadium increases strength and high yield ratio as well as other properties, claimed G. L. Norris, Vanadium Corporation of America, New York, as controverting the author's statement that a certain steel owes its high properties to the manganese content.

Effect of Banded Structures

There was considerable difference of opinion as to the effect of banded structures. Mr. Fry said that 75 per cent of plain carbon forgings have this structure and that a high-temperature anneal will remove it. Robert Job, Montreal, Canada, declared that such structures should not be present.

Macro tests are best suited to determine quality of alloy steels and others, in the opinion of E. L. Edwards, chief metallurgist, American Locomotive Co., Schenectady, N. Y. Most forging blooms are satisfactory and acid steel is not always the best. Penetration of the heat is equally important with the temperature in heating forgings. Epidemics of axle failures are due to improper fillets and lack of lubrication.

Electric Steel Melting Practice

AN excellent paper on electric steel melting practice was that by H. P. Rassbach, Midvale Steel Co., Philadelphia, entitled "Melting Practice for Three Types of Electric Steel."

From the practical standpoint the melting practice for plain carbon, simple alloy or complex alloy steels is discussed in concrete examples. In plain carbon steels the carbon content of the charge should be fairly close to the desired carbon; in a chrome-vanadium or similar heat, the charge should contain as much of the desired alloys as are available from the scrap on hand, much of which can be recovered by proper slag control; in a high-speed steel heat the same is true. In spite of the high alloy content, the slag in this case can be deoxidized to a high degree. Melting practice and logs of the three types of heats are thoroughly discussed. In general, bath temperatures should be hot; cold heats often give trouble. It is good practice to tap hot and hold the heats in the ladle for a sufficient length of time to cool to the proper temperature.

Modifications of practice necessitated by change from low to high voltage were called to attention by H. M. German, Universal Steel Co., Bridgeville, Pa. Some of his experiences in this phase of electric furnace practice were interestingly outlined.

Those in attendance at this steel metallurgy session, about 500 in all, were fortunate in having as chairman Radclyffe Furness, of the Midvale Steel Co., Philadelphia, a pioneer authority on steel melting. The meeting was fittingly brought to a close by a few remarks by him.

Mr. Furness said he could never feel that the basic open-hearth can produce as good steel as the acid. Slag changes do not take place at once. The electric furnace is a wonderful tool; with it one can do things that seem almost impossible.

Fissures and Other Flaws Found in Rails by Exploration

BY C. W. GENNET, JR.*

MODERN rails consist of a hard and almost brittle steel rolled into a peculiar, unsymmetrical section. The steel lends itself easily to heat treatment, meaning that widely different physical characteristics can be easily produced by simple means. The unsymmetrical section, comprising the large mass of head metal and the thin web and base, is such as easily to acquire internal strains of an unusual extent. This combination is unique in rolled steel products, and it must not be surprising or disappointing if metallurgists and physicists fail to solve quickly all of the problems raised concerning rails.

Any discussion of the cause of fissures amounts to mulling over the evidence collected, first, by those who regard the cause as due to a defect inherent in the rails when they leave the mill, and, second, by those who stand by the metal, but allege that the traffic over the rails is really the actuating cause for an interior rupture, or crack, which grows into a fissure. The only thing that apparently every one agrees on is that fissures develop or enlarge in size, under continued traffic.

Defect Probably Originates in Mill

It appears to me likely that the mill is fundamentally, but quite unintentionally, to blame; for seemingly some condition must occur during the fabrication of rails that introduces certain peculiarities in various rails from which fissures later develop. Exactly what that evil condition may be is a highly speculative matter, for, after all, comparatively little is known of the actual causes for various effects that occur in rails.

For instance, just why should two or three blows of a spike maul on the ⅝-in. web of a rail be apt to start a crack in the web as service continues? Why is a small nick in a piece of steel invariably a bid for a break later on? These may be trivial questions, but I mention them by way of showing that not only may fractures come from trivial causes, but that the attempt to locate the definite cause of some fractures may often be com-

*Vice-president, Sperry Rail Service Corporation, Chicago. This is taken from a paper read before convention of the Roadmasters' and Maintenance of Way Association of America.

plicated, because both the manufacture and the use of modern high-carbon rails is so involved.

Of much greater interest than the cause of fissures is an account of how we are finding them and what we are finding. A description of the detector car would be mostly repetition of what has been published before.† The three cars now operated by us have tested practically 5000 miles of track. The number of miles tested each day varies widely, depending on the condition of the surface of the rail under test, the traffic conditions encountered, and the time lost for making repairs; this latter item can now be virtually ignored.

We have tested over 30 miles on a number of different days, and then we have run on to long stretches of the well known corrugated, or wash-board, rails and operations have been terribly upset. Traffic is always a disturbing factor to the speed of testing. As a rule from 15 to 20 per cent of the time out may be used in getting the equipment out of the way of trains. This loss can be considerably decreased on double-tracked lines by cooperation from the dispatchers.

Other Types of Defects Now Located

One of the most interesting and perhaps surprising incidents of operating the detector cars has been the fact that many other defects in addition to fissures are so easily located and recorded. Primarily developed as a means for locating and recording fissures, the car was hardly expected to detect much of anything else. One of the early principles appeared to be that defects could be located only when they were transverse to the direction of the electric current. The complete change in the design of the detector first used at Beacon has greatly enlarged the scope, or field, of the car's utility, for we are now actually "picking up" quite as many defects of other types as we are of fissures. The value of the detector car has, therefore, been greatly enhanced.

These defects include split heads and sometimes what are probably real pipes, cracked webs, cracks at the junction of the head and web, and the commonly called horizontal fissures. One of the best arguments our men have had while testing was caused by a split head in the very early stage of formation. The operator claimed that the rail contained an interior defect, but not a fissure; the railroad man was skeptical because no exterior sign of the split head could be found. Breaking the rail easily proved the accuracy of the detector and the admiration of the skeptic was won.

Another interesting case was found at a highway crossing, where planking quite shielded the complete rail section from view. There the detector car told of what proved to be a serious crack several feet in length at the junction of the head and web, and which I think it will be conceded was nearly as hazardous as a fissure might sometimes be.

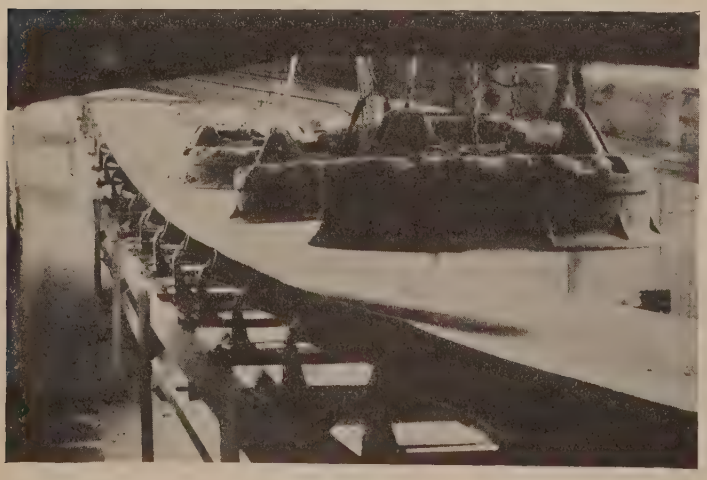
Quantitative Results on "Bad" Track

Generally the detector car has been assigned to test suspicious track, meaning track presumably containing fissures because of experience and records. Results for practically 1000 miles of tested track occurring on different lines, with different kinds and ages of rail laid under different track conditions, showed 116 transverse fissures, 66 horizontal fissures and 234 other defective rails. Thus there was one transverse fissure in every 9 miles, one horizontal in every 15 miles and one other bad rail in every 4 miles, totaling a defective rail every 2.4 miles.

To me the alarming phase of the whole situation is not with respect to the number of fissures and other defects found, but especially with respect to the size of some of the transverse fissures located. A great many rails are taken from track and broken immediately that the detector locates a fissure. Thus the awful naked truth is often revealed, and hence the frequent surprise that the defective rail gave safe passage to the last train. Many of the fissures found are bright and shiny, "air-tight," as they are called, and lack only a little from coming to the surface, yet they are often larger than a silver dollar in area and unquestionably must reduce the strength of the rail most seriously. We have found them chiefly during the warm or hot weather, and whether a rail containing a large fissure would have carried the last train safely in the cold winter weather is indeed a problem.

This naturally raises the question of how fast fissures grow. On that there is no reliable data at all, but we know that under ordinary conditions of traffic the growth may be faster than supposed. We have reason, from a few sporadic cases, to think that fissures may readily double in size within 60 days of normal traffic, but that is purely a random statement easily subject to change. Dr. James E. Howard, whose statements must always be given the greatest respect, made an air-tight fissure grow to the surface by comparatively few blows of a light hammer. Tests are badly needed so that a rule of thumb formula can be established and, based on the number of tons of traffic, some idea obtained of the probable rate of growth.

†See THE IRON AGE, Nov. 15, 1928, page 1214.



Removing Magnetic Material from Conveyor

THREE 45-in. electro-magnets specially wound for continuous operation are shown in the illustration. They are suspended over a conveyor belt at one of the Montana plants of the Anaconda Copper Mining Co. They were furnished by the Ohio Electric & Controller Co., Cleveland, to pick out all iron and steel particles from the material moving along the conveyor. By so doing they save the machinery from injury.

Should Scrap Brass Be Used or Sold?

Institute of Metals Discusses Economics of Reclamation of Copper, Brass, and Mixtures of Babbitt and Bronze

A GROUP of papers on secondary metals featured the program of the Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers, held in Cleveland during the week of Sept. 9. Such concentrated attention in warranted by the increasing tonnage of used but still usable alloys which are circulating in the metallurgical industries, and by the greatly increased amount of trained technical skill which is being employed in the reclamation process,—both factors having been frequently commented upon in past issues of THE IRON AGE.

However, not all the problems have been solved, by any means, as was developed in the discussion of the die casting program directed by a committee of the American Society for Testing Materials. Tests reported to them indicate that small traces of tin, lead, and cadmium affect the permanency of zinc-base die castings to a wholly disproportionate degree. The result is that a considerable tonnage of scrap castings is now available but is without buyers, even though the selling price may be but 10 per cent of the original cost of the component metals.

D. L. Colwell, metallurgist Stewart Die Casting Corporation, Chicago, is of the opinion that the market for die castings can be expanded four fold when the industry thoroughly appreciates the effect of minor impurities on the properties of die castings, and learns how to eliminate or counteract the danger of salting.

Wire Bars from Secondary Copper

A similar problem has been solved at the Western Electric Co., where wire bars of good drawing qualities and standard electrical conductivity are made from copper wire reclaimed from obsolete telephone equipment, old line wire, and wire-mill scrap. The operation was described by W. A. Scheuch and J. Walter Scott, metallurgical engineers, Hawthorne Works, Western Electric Co., Chicago, in a paper entitled "Manufacture of Wire Bars from Secondary Copper."

Lead is the principal impurity to be contended with; it enters through wire ends covered with solder not discarded by the sorters. Every effort is made to keep it out of the charge, but melts will commonly analyze 0.015 per cent lead, and at times even as high as 0.1 per cent. This must be removed to 0.005 per cent or less, because more than this retards the necessary annealing operations on the fine gage wire to be produced. Lead is eliminated by oxidizing the furnace charge thoroughly, making up a slag with equal parts of lime rock and sand, and blowing the bath with air. This is repeated at hourly intervals until the lead is shown by chemical analysis to be reduced to the minimum. Nine hours is required to reduce 0.030 per cent lead to 0.003.

Success is ascribed by the authors to several factors, each indispensable. First, the scrap is carefully sorted and only *clean* scrap copper is charged. Second, the furnace is solidly built with magnesite walls which prevent salting. Third, ample burner capacity is available to oxidize the charge thoroughly during melting. Fourth, the bath is manipulated according to the indications of frequent chemical analyses, and the entire operation is always under close technical supervision. About 90,000 lb. of copper wire bars are made daily.

Should Scrap Be Used or Sold?

H. M. St. John, chief metallurgist Detroit Lubricator Co., Detroit, in a paper entitled "Utilization of Secondary Metals in the Red Brass Foundry" advanced the opinion that it would be equally possible for an intelligent foundryman to make high grade pressure castings from reclaimed metal, even bought in the open market. Such a practice forces him, however, to examine his raw materials with scrupulous care—a duty which is unnecessary when he uses virgin metal or composition ingot from a reputable metal company. In Mr. St. John's opinion the proportion of virgin copper which would ordinarily be put into mixes to "give the metal life," functions primarily to enhance fluidity, and there are other and cheaper ways of doing this.

A foundry which gets scrap for melting outside its affiliated operations should buy it in the raw state; some knowledge of its history is necessary, and melting destroys all evidence of its source. This means that miscellaneous scrap would be unsuitable for direct foundry use, and must be absorbed by a smelter of secondary metals. V. Skillman, metallurgist Bohn Aluminum & Brass Corporation, Detroit, pointed out that such a plan, extensively followed, might easily turn out to be uneconomic, since if foundries skimmed the cream from the scrap metal supply, the complex residues could only be reclaimed into usable shape for a disproportionately increased cost.

The chairman of the meeting, T. A. Wright, chief chemist Lucius Pitkin, Inc., New York, said that this effect was being felt already, for the manufacturer of composition ingot is now forced to send to a smelter many carloads of fairly good scrap because it contains an unmanageable content of some minor metal. W. F. Graham, Ohio Brass Co., Mansfield, Ohio, also doubted whether foundries should attempt to make their own ingot from scrap metal and thus compete with an established industry, one which was an essential adjunct to the foundry trade (since in his opinion all red brass melting should be from the ingot). He was ready to admit that a good foundry could do what Mr. St. John was recommending, but thought the over all cost would in nearly every case be higher than though it bought its ingot from firms who are equipped to melt, mix and refine the metal properly.

Mixed Scrap May Be Smelted in a Cupola

In a paper entitled "Reclaiming Non-Ferrous Scrap Metals at Manufacturing Plants", Francis N. Flynn, metallurgist, Milwaukee, also supported the idea that intelligent segregation and re-use of the process scrap would show profits over the usual procedure of selling it all, good and bad, to a dealer. Mr. Flynn took the attitude that any salvage department worthy of the name would take every reasonable precaution to keep the scrap clean, and prepare it for sale or for use in such a manner as to

secure the maximum credit. He presented a table of 14 major classifications and 51 sub-classes of manufacturing scrap, indicating those which in his opinion could be substituted for virgin metal in the foundry, those which could be cast into composition ingot before remelting for casting, and those which should be sold to custom smelters.

One feature of Mr. Flynn's paper which was discussed in detail was the section describing the smelting of concentrated foundry cleanings, ladle shells, skimmings and mixed borings in a small foundry cupola with a high tuyere zone, using limerock, fluorspar and iron scale as fluxes. Advantages for a brick-lined cupola over a water-jacketed smelting furnace are that the equipment is available in most foundries, the furnace can be started on short order and the bottom dropped whenever the available metal is used, and the metal produced is lower in iron. E. R. Darby, metallurgist Bunting Brass & Bronze Co., Toleo, Ohio, agreed that the brick lined cupola would produce a cleaner metal, but to do so must carry slags which attacked the linings rapidly, and the repair cost would be large.

Separating Babbitt From Bronze

The problem of mixed babbitt and bronze is a difficult one to handle. P. J. Potter, metallurgist Federal Mogul Corporation, Detroit, treated this matter in a general way in a brief paper "Recovery of Waste from Tin-Base Babbitting Operation." In general the skimmings, borings and other metallic wastes are "sweated" or heated at low temperature in a reverberatory furnace and the resulting high-tin alloy cleaned of zinc by agitating with steam. To the remaining tin-copper alloy is added at least an equal quantity of virgin metal to bring it to specification, when it is ready to cast into bearings.

Residues from sweating operations and other drosses are smelted with carbon in a reverberatory furnace, the zinc steamed out and the remainder freed from oxides, iron and non-metallic inclusions by fluxing with sulphur and rosin. High lead is reduced by dilution. Borings and turnings of mixed babbitt and bronze from finish machining may be segregated usefully by screening—the babbitt particles are generally coarser than the bronze, and the coarse screenings may be treated as above while the fine screenings may be absorbed by the bronze foundry or sold as such on a favorable market.

R. W. Drier, Michigan College of Mining and Technology, Houghton, reported that a fairly good separation of babbitt and bronze or brass could be made as follows: Grind the mixture to a uniform fine size and make a babbitt concentrate by an electrostatic concentrator, using current at about 30,000 volts. The brass tailing can then be cleaned very well in a small flotation cell, and the residue dried and returned to the head of the circuit for retreatment.

Electrochemistry in Aeronautics

Notable Symposium Emphasizes Application of Aluminum and Magnesium and Their Alloys—Bright Future for Beryllium

THAT electrochemists have been responsible to a large degree for the growth of the aeronautical industry was prominently emphasized last week at Pittsburgh. The American Electrochemical Society held another of its successful and important symposiums during its annual fall convention, Sept. 19 to 21, at the William Penn Hotel. Under the title, "Contributions of Electrochemistry to Aeronautics," nine papers were presented and discussed before an audience of nearly 300, on Thursday morning, Sept. 19. Light alloys of aluminum and of magnesium were authoritatively dealt with and beryllium came in for its share of attention. Some of the chief points emphasized and discussed follow:

Three Important Aluminum Alloys

THREE leading alloys of aluminum have gained a vital place in aeronautics, said T. W. Bossert, assistant metallurgist, Aluminum Co. of America, in introducing the symposium,—duralumin or 17ST, a forging alloy, 25ST, and a modified form of the latter, or 51ST, which, because of its excellent workability, finds many applications where the higher strength of 25ST is not so necessary. Both 17ST and 25SE have a tensile strength of 55,000 to 60,000 lb. per sq. in. with an elastic limit of 30,000 to 35,000 lb., and an elongation of 18 to 20 per cent. The alloy 51ST has a tensile strength of 45,000 to 50,000 lb. per sq. in., with an elastic limit about the same as the other two alloys. One use to which it is put is forged propellers.

Wide application of aluminum alloys as castings has been attained, continued Mr. Bossert, both as cast and heat treated—particularly in aircraft engines. About 50 to 60 per cent of such castings go into such engines. Their ductility and shock resistance is pronounced. "Were it not for the aluminum alloys, the very low-weight, horsepower ratio obtainable in aircraft engines would not be possible." All modern dirigibles—the Los Angeles, Graf Zeppelin, the ZMC2, and the two mammoth ones now under construction for the Navy—depend on this duralumin wrought alloy. And aluminum bronze powder is decidedly important to aircraft because of the protection it affords against sunlight, moisture and salt water.

Prominent Aeronautical Men Speak

BEFORE calling on Mr. Bossert, Dr. J. D. Edwards, assistant director of research, Aluminum Co. of America, as chairman, emphasized the appropriateness of such a symposium in Pittsburgh, where the aluminum industry had its birth in 1888 as the Pittsburgh Reduction Co., and where, in 41 years, great progress has been made. He said the society was honored by the presence of men prominent in aeronautics—E. P. Warner, formerly assistant secretary of commerce for aviation, now editor of *Aviation*, and Dr. Lewis, director of aeronautical research, National Advisory Council of Aeronautics. Both were called on.

Trends of late have been from wood to metal in aircraft construction, said Mr. Warner. In the 5000 airplanes at present licensed in this country, only 2 per cent are using aluminum alloys in wing or fuselage construction. In military planes aluminum wing spars predominate. In engines, however, 3500 tons of aluminum alloys is used. Factors which really dictate are economic saving in weight and cost of fabrication. When metals are cheap enough, all other things considered, the really serious economic dilemma confronting the industry may be solved—increased production is one solution.

Devotion of one session of this society to such a sub-

ject was a great gratification to Dr. Lewis. Weight is the most important factor now facing the industry—the aim is the greatest carrying power per unit of weight. Corrosion problems are serious. An engine now has a life of about 1000 hr.—it should have more. The usual load is about 20 to 30 per cent of the weight of the craft. A lighter, stronger material is sorely needed.

Magnesium Mainly Used in Fabricated Form

ONE-THIRD lighter than aluminum, magnesium is used mainly in fabricated forms in aircraft. If an aluminum casting weighs 30 lb., one of magnesium has a weight of 20 lb. By alloying, as in the case of aluminum, magnesium has been greatly improved. The alloying elements are aluminum (about 7 per cent), zinc (about 3 per cent) with some manganese and cadmium. Such alloys as castings possess mechanical properties substantially equal to the best of the high-strength aluminum alloys. Alloyed with manganese, remarkable resistance to corrosion is obtained. Machinability of magnesium alloys in general is an outstanding property. Magnesium forgings are no longer experimental as they possess comparatively high mechanical strength. Propeller blades, differing very little from wood in weight, are now made of magnesium alloys. These facts were presented by W. G. Harvey, Aluminum Co. of America, Cleveland, in a paper, "Magnesium and Its Alloys."

Magnesium alloy propeller blades look very promising, said F. W. Caldwell, McCook Field, Dayton, Ohio. The relatively high fatigue values look good—there has been trouble with aluminum alloys. An advantage for magnesium is a stiffer blade with less weight. Comparative cost was stated by Mr. Harvey to be at about 1 to 2½. He also said, in reply to an inquiry, that magnesium sheets are hot-rolled first from billets, and then cold-rolled to a finish with frequent annealing because hardening during cold work is a property.

Beryllium Has Remarkable Properties

Beryllium's outstanding property is its high modulus of elasticity, about equal to steel, declared Dr. H. W. Gillett, director, Battelle Memorial Institute, Columbus, Ohio, in a paper, "Possible Use of Beryllium in Aircraft Construction." This metal will some day be an important factor in aircraft construction. The factor of ignorance is high compared with the 40 years of aluminum development and 20 years of magnesium. Its specific gravity is of the order of the specific gravities of aluminum and magnesium, its melting point is very high. Alloys high in beryllium have a tensile strength of 100,000 lb. per sq. in. in the direction of rolling, and 70,000 lb. across the direction of rolling. The metal is very hard to work and requires hot working all the way down. As castings, pure beryllium and its alloys are hard to handle; they usually contain blow holes. At $200 per lb. it is out of reach, and yet the metal is more abundant in the earth's crust than either lead or zinc. Cost can come down to $25 to $50. Dr. Zay Jeffries has said that it is worth $40 to cut the weight of aircraft one pound. "Many are pessimistic on beryllium; I am among the many optimists," said Dr. Gillett.

An entering wedge abroad has been made by beryllium said Dr. Engle. The German firm, Siemens & Halske, is making 8 lb. per day at $100 per lb., and a beryllium bronze (2 per cent Be.) is now used by German railroads. It has high fatigue resistance.

Solution Potentials of Aluminum and Corrosion

PURE aluminum is electro negative to many of its alloys and particularly to 17S or duralumin. This fact is of importance in connection with the protection of exposed edges on duplex metal products, such as Alclad sheet, said J. D. Edwards, assistant director of research, and Cyril S. Taylor, physical chemist, Aluminum Co. of America, in their paper, "Solution Potentials of Aluminum Alloys in Relation to Corrosion." The potential differences arising from contacts between aluminum and its alloys, as well as other metals, in the presence of an electrolyte, are of theoretical interest and practical importance. Although these potential measurements show such wide variations that their quantitative significance is limited, qualitatively they are important in explaining the behavior of the metals in contact under corrosion conditions.

The factor of ignorance in this field was large in 1917, said Starr Truscott, assistant to Dr. Lewis, who spoke earlier; today it is much less. The aim has been and is the hunting for a strong metal with which to build dirigibles. Tendency is now away from wood to metals. Plating aluminum alloys with chromium has not been entirely successful, but it should be considered—it does not protect as does zinc on steel. "I appreciate the great work that electrochemists have done for aeronautics."

Electroplating Aluminum on Steel

Calling attention to the following sentence from the author's paper: "In general aluminum can be safely used in contact with iron and steel, and the tendency is for aluminum to protect partially the iron and steel against corrosion." Edwin F. Cone, associate editor, THE IRON AGE, New York, related an experience. Some months ago, Mr. Cone said, his attention was called to the claims of a company that it was plating aluminum, or an alloy of aluminum, on steel sheets,—offering a substitute for tin plate for many uses.

Samples of the coated sheet were sent to research laboratories. Reports are not complete but are conflicting. A majority state that a very thin layer of aluminum is present, while one reports an entirely different metal. Mr. Cone raised the question—can aluminum be electrolytically plated on steel?

Dr. F. C. Frary, president of the society, said that aluminum cannot be plated on steel, although there are many patents for plating from aqueous solution. The aluminum decomposes water, hydrogen is evolved, preventing successful plating. Dr. William Blum, Bureau of Standards, states that about 25 years ago a man took a contract to plate the dome of the City Hall tower, at Philadelphia, with aluminum—the result was a coating of zinc from the alloy evidently used.

Attention was called to the fact by Dr. Colin G. Fink, Columbia University, New York, to the fact that large amounts of sodium are electrolytically plated or deposited in an aqueous solution, and he added that there is no more action than in the case of aluminum. The sodium is deposited on or with mercury and then recovered from this amalgam. Dr. H. W. Gillett offered the suggestion that the coating be examined with the X-ray, which would reveal whether it is a covering of metal or oxide, etc. Mr. Cone said further examination would be attempted with a piece which has a heavier coating. In Germany, he added, thin sheets of aluminum are now rolled or sweated on steel. American chemists have plated the metal from expensive organic salts of aluminum.

Other Papers in the Symposium

ALUMINUM can be given a pleasing dead-white finish by boiling it in a mixture of lime and calcium sulphate. The process and a few uses for the product were discussed in a paper, "Lime Process for Coating Aluminum" by Leon McCulloch, research department, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Two other papers presented at the symposium were "The Effect of Iron on the Magnetic Susceptibility of Aluminum" by Ralph B. Mason, physical chemist, research bureau, Aluminum Co. of America, and "Thermo-Electric Tests for Aluminum, Manganese and Other Alloys," by Cyril S. Taylor and J. D. Edwards, research bureau, Aluminum Co. of America.

Automatic Thin-Sheet Arc Welding

Electro-Magnetic Control Necessary for Good Results—How the Flux Operates and How It Is Handled

BY W. L. WARNER*

FUSION welding requires that the parts to be joined be brought up to a molten condition over a certain portion of their extent. The temperature of this molten condition varies with different metals, and the temperature limits between which the fusion operation must be performed are narrower with some metals than with others.

To accomplish a thorough fusion between parts to be welded a certain time is required, depending on the nature of the material and the effective heating power of the welding flame. Probably more radical changes take place during this brief time interval than in any other equivalent cycle of metal handling. The change from room temperature to the molten condition is almost instantaneous and the cooling cycle is necessarily short, owing to the very local extent of the molten zone. This means that the metal is heated to above the melting point and returned again to a solid condition in the space of a few seconds.

Obviously the resulting joint must be something different from the material it joins; the metallurgist will confirm this. For many years we have been accustomed to see sheet edges lapped and held together by a row of rivets. Thus there has been a feeling that the butt joint which has been made so smoothly and quickly must be only a substitute and not to be relied upon. As a matter of fact, the welded joint will develop at least 85 per cent of the strength of the sheets joined, and usually the sheet will yield before the joint.

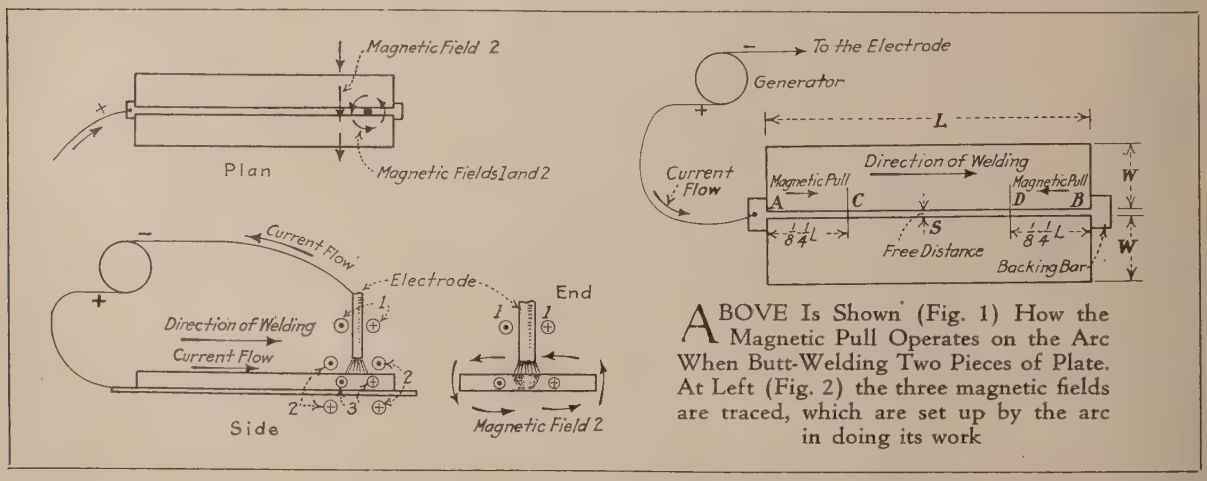
Parts or sheets to be joined are placed in the same plane, with edges butted together where the weld is to be made, and usually clamped on to a suitable backing device for the weld. An arc is struck and maintained, between a metal electrode and the joint edges. This arc is moved continuously at the proper speed from one end of the joint to the other, fusing the two edges together.

It is essential that the joint be backed up tightly by some means to prevent the molten metal from running through forming protrusions on the back of the joint and also leaving holes in the joint. This backing up device must fulfill several requirements. The material must be of such a nature that it will not melt and fuse to the back of the joint.

Copper bar stock or strip is generally used for this backing, due to its high heat-conducting properties and durability for this service. The backing up device must be somewhat flexible, and yet exert sufficient force to clamp and hold the joint edges evenly together. In some cases it may be possible to butt-weld thin sheets without a backing, but usually variations in preparation of the joint edges on a production basis prevent a successful job.

When heat is applied to steel or iron, a distortion or displacement occurs in three directions. As the heat is removed the material tends to return to normal. The amount of this expansion and contraction depends upon the rate of application of the heat and the length of time over which it is applied.

In welding, an intense heat is applied at a point on the metal surface and is then moved rapidly along, causing a small part of the metal to come to the melting point and solidify in a fraction of a second as the arc passes over it. As the melted metal does not return to the original temperature as quickly as the heat was applied, there is a cumulative effect. This effect produces a net expansion in three directions with respect to the weld—longitudinal, lateral and vertical.



ABOVE Is Shown (Fig. 1) How the Magnetic Pull Operates on the Arc When Butt-Welding Two Pieces of Plate. At Left (Fig. 2) the three magnetic fields are traced, which are set up by the arc in doing its work

*Industrial Heating and Welding Engineering Department, General Electric Co., Schenectady, N. Y. From a paper read before a joint meeting of the American Welding Society and the American Society of Mechanical Engineers, Cleveland, Sept. 12.

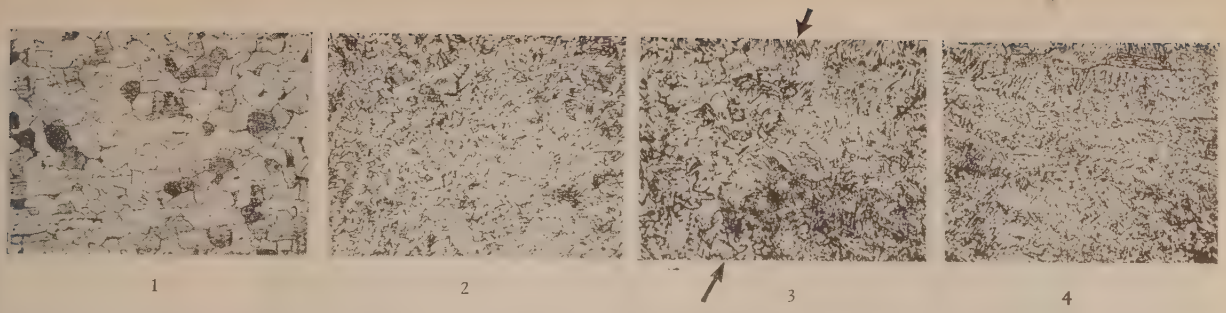


FIG. 3—Photomicrographs Taken from Bright, Deep-Drawing Steel, Magnification 100 Diameters. (In reproducing, a reduction of 22 per cent was made.) The diagram at right shows locations of (1) base metal; (2) center, heated zone; (3) fusion zone; (4) weld metal

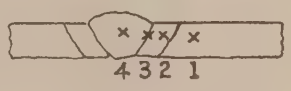

If two flat strips are placed together and a weld is started at one end, the joint edges begin to separate after the arc has traveled about a third of the way down the seam. This separation will continue until the joint edges are apart a distance greater than the electrode diameter, if the welding is continued. To prevent this separation when welding flat strips, a tack weld is usually placed at each end of the joint. This separation or moving apart of the plates is caused by the combined longitudinal and lateral expansion; its amount depends upon the lateral width of the pieces being welded, the amount of welding heat and the welding speed. This separation does not occur to the same degree in plates above ¼ in. thick,

Assuming that two strips have been tack welded and the weld made; if the welded piece is taken from the machine immediately, it will be curved longitudinally and flat laterally. If, however, the welded piece is left in the clamp until cold, a portion of this distortion will be eliminated. Welds of this type made on cylindrical drums or rectangular box structures do not show this distortion, because of the vertical and lateral stiffening effect of the shape of the piece.

With these conditions in mind one can readily see the importance of suitable clamping apparatus and procedure for welding thin sheet metal successfully.

Electro-Magnetic Control

ANOTHER condition which is likely to cause trouble unless controlled is the magnetic effect produced by the electric current passing through the arc. It is generally understood that, when an electric current passes through a conductor, a magnetic field of a certain intensity is set up in a certain direction around the conductor. This magnetic field tends to travel in the path of least resistance and resists deflection from this path in proportion to its intensity.

It is neither possible nor desirable to discuss these electro-magnetic conditions in detail, except in so far as to try to explain certain methods now used to control these conditions.

Fig. 1 shows in plan a weld being made between two pieces of plate, the joint extending from *A* to *B*. The weld progresses from *A* to *B* with the ground connection from the generator made to the copper backing bar at end *A*. In practice this is generally the situation for magnetic control purposes.

As the weld progresses from *A* to *B* a careful observation of the arc and arc flame will show a decidedly forward pull of both arc stream and flame for approximately one-eighth to one-quarter of the length of the seam. This forward pull is a maximum at the start of the weld and becomes almost zero at about *C*. From this point to *D* the pull of the arc is gradually changing from a slight forward pull to a slight backward pull, and it is most stable between these points. From *D* to the end of the joint at *B* the backward pull increases rapidly until, within an inch or so from the end, this tendency to pull back may be sufficient to extinguish the arc.

This varying condition obviously tends toward instability of the arc. It may be responsible for lack of fusion, porosity and an unevenly welded joint. In general it may be said that with a copper backing bar the arc will have a tendency to pull away from the ground connection. The amount of pull, which depends upon the strength of the magnetic field causing it, will vary with the amount of welding current, size of pieces being welded, free distance between joint edges *S*, and position of the electrode on the joint.

A magnetic field is set up in the plane of the pieces being joined, in addition to that circumferentially around the electrode and the plates being joined. Fig. 2 shows the location and direction of the magnetic fields set up by the welding current of the arc in welding two pieces of

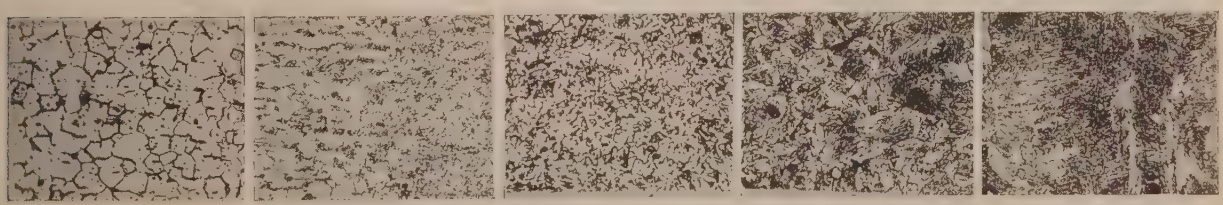

FIG. 4—Photomicrographs Taken from Blue Annealed Steel, Magnification 100 Diameters. (In reproducing, a reduction of 32 per cent was made.) The diagram at right shows locations of (1) base metal; (1a) edge, heated zone; (2) center, heated zone; (3) fusion zone; (4) weld metal

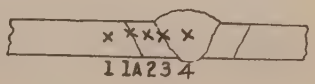
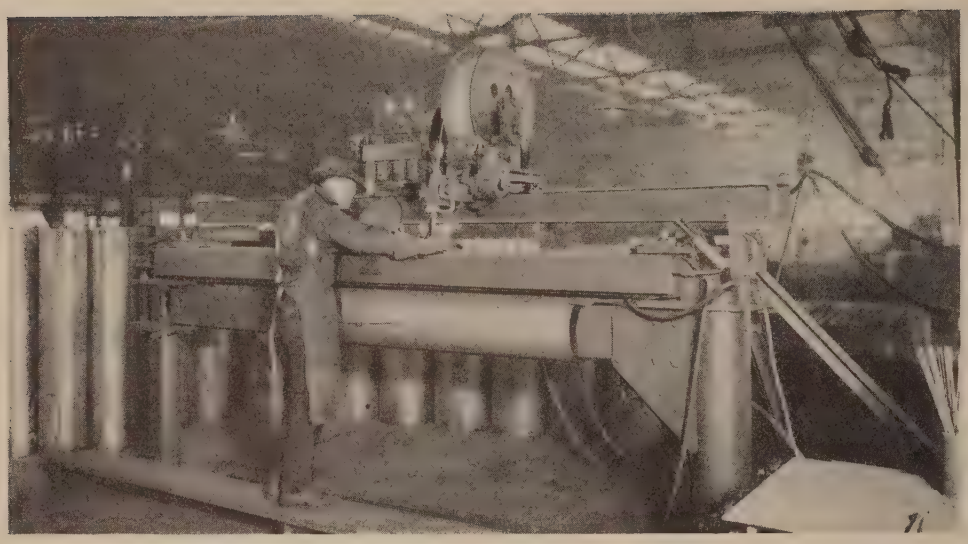




SIDE View of an Automatic Arc Welder Employed in Welding the Side Seams of Kitchen Range Boilers. This is in the plant of William B. Scaife Co., Oakmont, Pa.

plate. Field (1) is set up around the electrode, field (2) around the plates being welded, and field (3) in the plates adjacent to the arc and in direction similar to field (1). Apparently field (3), which tends to maintain itself in the plates, is what causes the arc to draw away from either end of the weld.

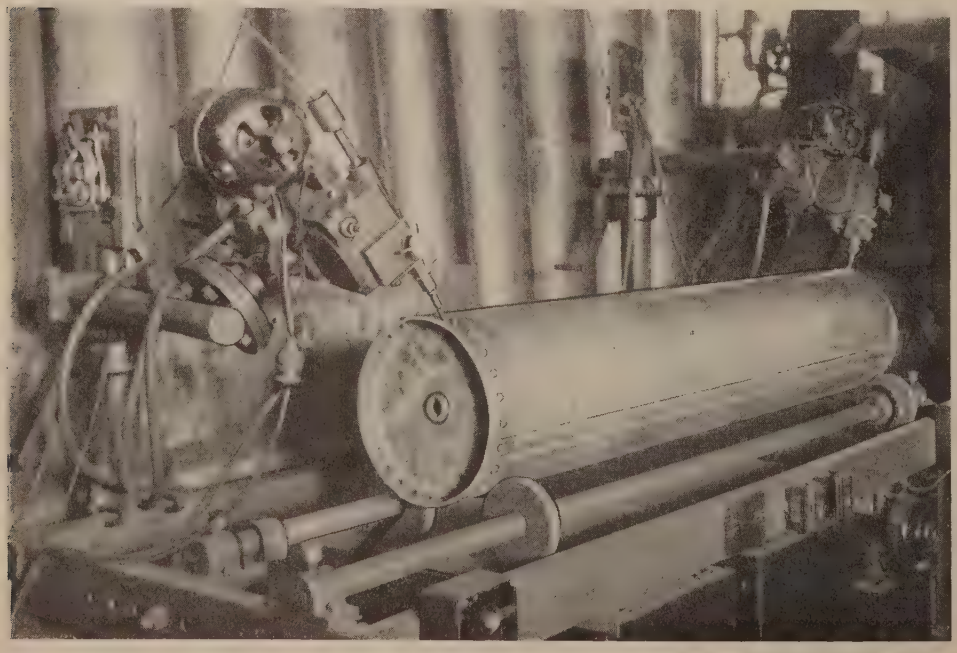
Owing to this constriction of this field between the arc and the starting or finishing ends of the plates, a drawing effect is produced which usually is less noticeable at the start than that near the finish of the weld. As it obviously is not possible to remove these fields from the welding operation, it is necessary to use external control means to overcome these magnetic effects.

Such a control scheme as developed by the General Electric Co. consists of imposing a magnetic field of proper direction and intensity to cause the arc to become least affected by magnetic fields (1) and (3) and any others which may be set up in the clamping device. Field (2) tends to cause the arc to draw slightly ahead, which is desirable.

The pieces to be welded are held in place by a pair of copper jaws, a copper chill bar and corners of steel strips used in building up the complete backing bar. Beneath the copper chill bar is an insulated conductor so connected that part of the welding current may be shunted through it.

When the current flows through the insulated conductor under the chill bar in the direction of welding, a magnetic field is set up, in the plates being welded, in the direction parallel to field (2). It is essential that the work and the steel edges of the backing bar make contact; otherwise, the high reluctance of the air gap, when there is no contact, will reduce the amount of flux through the work and render the magnetic control ineffective.

The magnetic flux in the work and across the seam at the joint being welded acts upon the arc in the same manner as the field of a direct-current motor acts on an armature conductor. Applying the same magnetic laws, this field will tend to blow the arc in the direction in



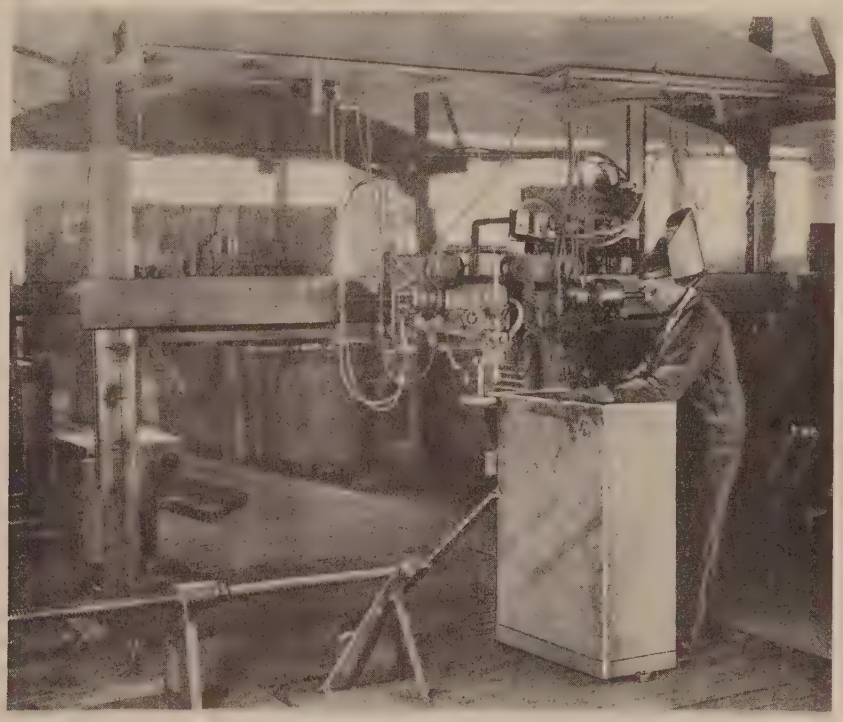
TWO Circular Seam Welders at Work Automatically Welding Head and Bottom, Simultaneously, of a Kitchen Range Boiler in the William B. Scaife Co. Plant, Oakmont, Pa.

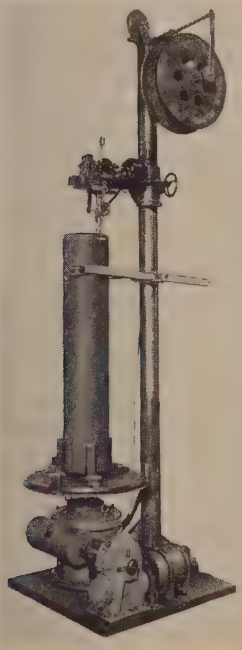
which it is traveling. To render this control effective it is necessary that the insulated conductor be so placed that the magnetic controlling field is caused to travel, during part of its path, through the work and across the seam being welded.

Microscopic sections in Figs. 3 and 4 were taken from welds made on No. 14 gage sheet at 29 in. a minute, and show the structures at four different points from the base metal to the deposited metal. In these welds the total width of weld and heat zones was not over one-quarter inch. Figure 3 is a weld on bright, deep-drawing, low-carbon steel. The photomicrograph taken at the fusion zone indicates quite a definite line of fusion, marked by the small arrows.

Fig. 4 is a weld on blue annealed sheet of slightly higher carbon content than the deep-drawing steel. It will be noted that the photomicrograph of the fusion zone in Fig. 4 does not indicate a definite line of fusion. In contrast with this comparison, one photomicrograph of Fig. 4 shows the edge of the heat zone, which is more distinct than the edge of the heat zone occurring in the welds of the deep-drawing steel, Fig. 3.

AUTOMATICALLY Arc Welding Two Bottom Seams in Wayside Oil-Vending Tank (Right) in Plant of Fry Equipment Corporation, Rochester, Pa.





VERTICAL, Circular Tank-Welding Machine (Left) with Welding Head, Pilot and Guide Rollers

Applications of Automatic Arc Welding

USE of welding for manufacturing household range boilers is practised extensively. One view shows the side seam being automatically welded at a speed of about 16 in. a minute for a butt weld on No. 14 gage sheet. The joint edges are clamped pneumatically and the magnetic control switch is shown on the right end of the machine.

After the shell is completed and the dished heads are inserted the circular welds are made usually by a vertical machine such as shown in another view. Or these seams may be welded with the tank in a horizontal position as shown in view with two welds being made simultaneously, one at each end.

The choice between horizontal and vertical is largely a question of design of tank, user's preference, and space available. The horizontal type is easier to load. The vertical type gives a better position to make the weld, where the thickness of the head is appreciably greater than that of the shell.

Wayside station oil vending tank bottoms are shown in another view, being welded at a speed of approximately 30 in. a minute. The welding heads are fixed in position and the tanks travel on a conveyor. The tank material is No. 15 gage and the electrode nozzles are fitted with guide rolls which keep the arc on the seam at the corner, so that a combination corner-edge weld is made. This operation requires very sensitive control and accurate fit of the heads into the shells.

Welding of galvanized iron is performed at welding speeds somewhat higher than those used for the plain material. It is desirable to avoid full weld penetration of the joint, on account of porosity caused by gas from the melted under-coating. If full penetration is required, then best results are obtained without backing. Under such conditions accuracy in the alinement of the joint edges is imperative.

In general the application of machine welding methods to thin sheets requires accurate preparation of the joint for welding, suitable methods of clamping, proper welding materials, both electrode and plate, intelligent supervision and correct design. Beveling is usually not necessary or desirable for thicknesses below one-quarter inch.

Support sidewise to prevent buckling of a compression flange in a structural beam is the subject of technical data Bulletin No. 2 issued by the American Institute of Steel Construction, 285 Madison Avenue, New York. Conditions which cause such a flange to buckle are either unintentional crookedness in the flange itself or unintentional eccentricity in the application of the load.

Influences Affecting Wire Rope

Survey Being Made to Determine What Materials and Manufacturing Methods Will Give Long Life and Safety

WIRE rope studies and means of coordinating efforts along that line of research formed the subject before a meeting of the American Society of Mechanical Engineers in the Engineering Societies Building, New York, on Sept. 13. The discussion was started by Dr. Elmer A. Sperry, president of the society, by a brief reference to the progress he is making in extending, to an exploration of conditions within wire rope in service, the methods he has been using for some time in studying steel rails. He spoke particularly of some of the disturbing elements in elevator cables, such as grease and "whiskers," which have made necessary some changes in the method of approach. It was found difficult, against this handicap, to induce his small exploratory current to travel along the cable.

American-German Cooperation in Wire Rope Research

COOPERATION between American and German engineers engaged in wire rope research was reported by Prof. Dr. Conrad Matschoss, director, Verein deutscher Ingenieure, Berlin, as greeted with great enthusiasm by German engineers and leading research experts. Under the leadership of Professor Woernle of Stuttgart there has been an intimate exchange of ideas and experiences among the German experts. Some of the formerly disputable wire rope problems have been clarified on a scientific basis by the researches, already conducted. Such are:

Influence on the shape of the pulley groove on the life of wire rope.

Influence of wire diameter and the number of wires per strand on the life of wire rope.

Influence of wire strength on the life of wire rope.

Influence of the rope loading, of the rope twist, of the Trulay preliminary shaping of the wires, etc., on the life of wire rope.

So far the researches have been carried on essentially with elevator and crane ropes. Further investigations have been started relating to the influence and effect of galvanization and also to the chemical composition of the wire.

The quality of a wire rope is determined by its life, which is measured by the number of times the rope can be bent before rupture. These investigations include not only elevator and crane ropes, but also those for mining conveyor systems. Furthermore, the endurance limit of the wire rope is being investigated by means of bending tests.

British Wire-Rope Research

IN Great Britain the Wire Rope Research Committee of the Institution of Mechanical Engineers is studying the repeated bending of wire ropes over pulleys. Its first report, published in 1920, surveyed the literature of the subject, said W. A. Scoble, Woolwich, England. The search was discouraging, most of the papers and articles on wire ropes up to that date being useless or misleading. Many writers had little knowledge of the subject or gave little or incomplete data and wrong conclusions.

In the second report, in 1924, results were given of tests. The ropes used were small, 1 in. in circumference, to allow simple machines to be used and eight tests to proceed simultaneously. Briefly, a test rope, under tension, reciprocated on and off a test pulley. A set of ropes was made of similar wire of 80 to 90 gross tons per sq. in. tensile strength, 6 x 12 on hemp core, 6 x 19 and 6 x 7 construction, each in ordinary and Lang's lay.

Each rope was tested thus: a sample was used over a pulley, say 6 in. in diameter, under a definite tension, and was run until the rope failed and the number of bends to failure was noted. A million bends was taken as a maximum but this was reduced to half a million for subsequent tests. The same rope was next tested on the same pulley under a different tension and so on, until a curve could be drawn to connect rope tension and bends to failure for that particular rope on the 6-in. pulley. The same rope was tested similarly on pulleys of other diameters. The other specimens were treated similarly. Thus it was possible to show separately the effect on the rope life of tension, pulley diameter, rope construction, and in each construction to compare ordinary and Lang's lay.

Tests recorded in the third report (1928) related to a set of ropes of similar constructions to the above but made of 100 to 110-ton wire. The results provided a general check on those obtained earlier and showed the effect of the wire strength.

It is important to know when to scrap a rope. The increase of the rate of stretch appears to be the most useful indication.

Wire Rope Life on Building Elevators

DATA reported by C. T. Coley, building manager, Equitable Office Building Corporation, New York, showed great variation in rope life under the same conditions on the same elevators in office buildings. As one example, he compared 48 passenger elevators, one to one traction, 36 inch sheaves, in one tall building, as shown in table. Each of six banks had eight elevators. The records show variations within each bank as follows:

		Mileage per Set of Cables		
Bank	Rise, Ft.	Low	High	Ratio
1	131	5,288	26,013	1 to 4.92
2	244	5,474	32,477	1 to 5.92
3	317	6,630	37,568	1 to 5.50
4	403	6,738	43,124	1 to 6.39
5	499½	6,672	41,730	1 to 6.25
6	499½	8,896	60,313	1 to 6.77

Records from another building, 25 stories high, with 13 elevators, show a variation in mileage of useful life on the express elevator cables of from a low of 2628 to a high of 70830 miles which is in the ratio of from 1 to 26.9. Similarly, the local elevator cable mileage varies from 3064 to 28,796 miles, which is in the ratio of from 1 to 9.4.

An old building, with hydraulic passenger elevator, uses rope ⅝ in. diameter, 6 strands, 19 wires, over 32-in.

sheaves. This rope is 315 ft. long. The length of life, in time, was as follows:

1892 to 1895	30 months	
1895 to 1896	19 months	(Leson ropes)
1896 to 1902	25 months	(Leson ropes)
1902 to 1906	52 months	(Leson ropes)
1906 to 1909	42 months	(Leson ropes)
1909 to 1913	46 months	(Leson ropes)
1913 to 1920	76 months	(Leson ropes)
1920 to 1922	33 months	(Roebling cables)
1922 to 1926	48 months	(Roebling cables)
1926 to 1929	30 months	(Roebling cables)

These data show clearly that there are unknown factors influencing the life of elevator cables working under practically identical operating conditions. The future study of the Research Committee may determine what these factors are and what corrections should be introduced in the manufacture and use of cables to increase their efficient life.

Speaking on the safety aspect of wire-rope use, W. S. Paine, research engineer, Aetna Life Insurance Co., Hartford, Conn., welcomed the research contemplated by the A.S.M.E.: "An investigation which will give the real metallurgy of the cables needed for a specific use, and at the same time provide a high-grade standard of manufacture, a research that will give the best method of installing elevator cables over the most efficient type of sheaves, and at the same time provide data covering the actual destruction which occurs from cables kinking, creeping, bending and whipping. These data will also reveal the most efficient method of lubrication, the effect of irregularity of the lay of the wire strands and also the effect of vibrations or whipping of a cable when it nears a position off the vertical."

Wire-rope problems of the elevator manufacturers were discussed by David L. Lindquist, chief engineer, Otis Elevator Co., New York. He expressed the opinion that elongation of the rope gives no definite indication of its condition.

G. P. Boomsliter, professor of mechanics, West Virginia University, Morgantown, referred to the "second stretch." One company which he cited has established the "practice to discard a hoisting rope (a) when the rope has shown the second stretch (pulling into core, or overlapping strands changing the diameter about 3/16 in., which is due to the second stretch) which indicates that the safety limit has been reached, due to the second stretch being caused by the actual weakening of the rope; (b) when there are a number of broken wires in each strand; (c) when there are a considerable number of broken wires in a short space."

This definite line of action was contrasted with the haphazard practice of many companies, whereby ropes were condemned only when they broke, or showed distress. For study, Professor Boomsliter recommended particularly wire ropes to be used in coal-mine hoisting.

Acceleration stresses.
Proper diameter of sheave and drum for size of rope.
How to eliminate starting shocks and shocks due to sudden braking.
A study of the effect of various grooves.
Methods of keeping rope tight at all times.
A study of the "second stretch," referred to in one of the above quotations, as a safe criterion for discarding hoisting rope.
New types of rope, especially:
(a) with respect to form of center core.
(b) with respect to material.

This last study seems of highest importance. If, as one engineer says, some wires wear to paper thinness before failure, while others break because of brittleness, it would seem that, if an alloy steel of high ductility and of high strength and endurance limit could be used, longer life of ropes could be attained.

Other Papers on the program were:

"Wire Rope Problems in the Construction Field," by M. M. Liebeskind.

"Use of Wire Rope on Cranes, Derricks and Hoists," by L. W. Hopkins, materials engineer, American Chain Co.

"Wire Rope Use by Steam Electric Generating Plants," by J. R. McCausland, superintendent of Coal Bureau, Philadelphia Electric Co.

"Wire Rope Problems Relating to Marine Use," by A. V. Bouillon, secretary, American Marine Standards Committee, Washington.

"Wire Rope Data Needed by Bridge Engineers," by O. E. Hovey, assistant chief engineer, American Bridge Co., New York.

"Use of Wire Rope in the Logging Industry," by Emanuel Fritz, professor, division of forestry, University of California, Berkeley.

"Wire Rope Problems Relating to Excavating Machinery," by W. M. Bager, vice-president, Bucyrus-Erie Co., South Milwaukee, Wis.

"Wire Rope Problems Relating to Cableways," by D. C. Sherman, Sherman & Reilly, Inc., Chicago.

Recommends Wire-Rope Research

At the close of the meeting the 50 engineers present adopted the following resolutions:

WHEREAS the discussion at this conference has revealed:
1. That wire rope is subjected to many and varied conditions of service;
2. That there is great variation in the life of wire rope; and
3. That there seems to be no accurate method of predicting wire rope life or of determining when its useful life is up

Be it resolved that

A cooperative research committee be organized under the auspices of Engineering Foundation and the American Society of Mechanical Engineers, and with the cooperation of other interested technical organizations, to make a study of the factors affecting wire rope life for the purpose of:
1. Formulating rules of recommended practice for the use and inspection of wire rope;
2. Emphasizing the factors to be considered in applying wire rope to its various uses; and
3. Pointing out possible improvements that might be made in the design, materials and fabrication of wire rope and wire-rope-using machinery.

Be it further resolved that

The research program adopted be developed according to the present research procedure of the American Society of Mechanical Engineers.

Welds Galvanized Steel With Bronze Rod

Welding of galvanized metal—sheet, pipe, or fittings—is not only possible, according to *Oxy-Acetylene Tips* for August, but experience proves it to be highly satisfactory. The heat of the welding flame burns off the zinc coating for a certain distance adjacent to the weld, but the zinc oxide from burning coating, or the underlying iron-zinc alloys, do not appreciably affect the strength of a weld, even when made with steel rod. A preferred welding material is a high strength bronze; this, used with a proper flux, is placed rapidly, at a lower heat, and consequently less of the original zinc coating is volatilized. The bare iron is apparently protected from corrosion by the adjoining zinc; at least long experience with welded galvanized pipe in air conditioning systems shows no perforations at the pipe-joint from the inside, where it is obviously impossible to paint the joint.

The article describes the manufacture of the floating bell for small acetylene generators from 18-gage galvanized steel. Formerly this joint was made with double-lock seams with solder sweated into the seam. Twenty-gage steel was the heaviest which could be used satisfactorily with this type of joint. Final inspection showed slight seam leaks in 24 per cent of the finished bells. Welding the 18-gage steel reduced the extra labor to repair leaky parts to the vanishing point; costs were further saved by substitution of pipe nipples welded on for flanged connections riveted and soldered on. Total costs were smaller, even after the heavier steel was paid for, and the joint is over three times as strong in direct tension.

Wreck Railroad Car to Test Helium Tank Mounted on It

A STAGED train wreck and a hydrostatic pressure test were recently applied to a type of spherical vessel built for the transportation of helium gas by the A. O. Smith Corporation, Milwaukee. The tests were witnessed by the tank car committee of the American Railway Association and representatives of the Bureau of Aeronautics, U.S.N., Corps of Engineers, U.S.A., the Bureau of Explosives, the Goodyear-Zeppelin Corporation, and the Wisconsin State Industrial Commission, as well as a number of railroad officials, consulting engineers and insurance inspectors.

The vessel was a steel sphere, 72 in. in inside diameter, formed of two halves of 1½-in. plate, welded together by the Smith process. It ultimately failed under a hydrostatic pressure of 4500 lb. per sq. in., after undergoing virtually 80 hours of severe battering, as for three days previous it had been continuously hammered by pneumatic hammers while under 1250 lb. hydrostatic pressure.

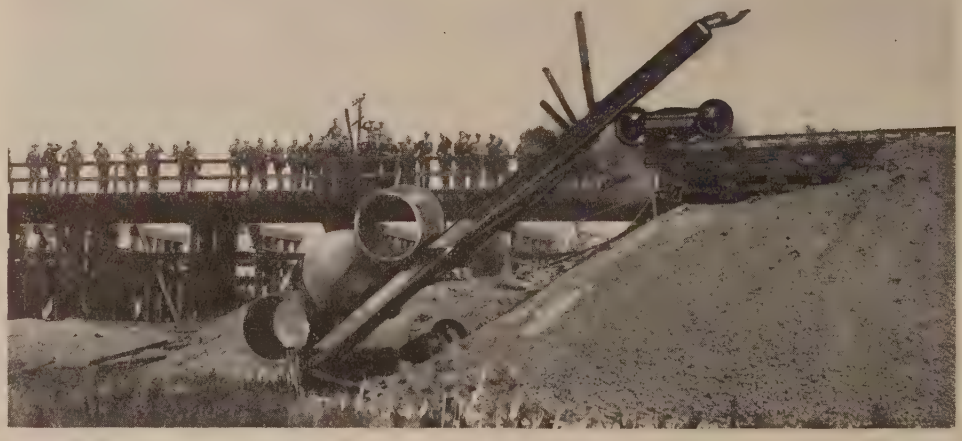
In the finished design, six of these tanks of slightly larger diameter, and designed for the transportation of helium gas at a pressure of 2000 lb. a sq. in., are to be mounted on specially designed gondolas.

To simulate the conditions that would arise, should such a car be wrecked, an actual derailment was arranged. The sphere then under 1250 lb. air pressure was lashed to a flat car and cylindrical steel sections weighing 14,500 lb. were lashed before and behind it. The car traveling at a high rate of speed was run off the end of a 25-ft. embankment. The car was completely wrecked, but the sphere was undamaged.

Following this test, the air was let out of the vessel and it was filled with water for the final tests. After undergoing repeated stress tests, hammer tests and tests to the elastic limit of the steel—with results that were checked by the tank car committee—the pressure was rapidly raised. The big steel sphere began to swell like a rubber ball after the elastic limit was passed. At the last measurement that could be taken, after a pressure of 4000 lb. had been reached, the sphere had increased 17 in. in circumference.

Under a steady hydrostatic pressure of 4500 lb. a sq. in. the vessel finally failed. The manner in which it fractured was also unusual and seemingly testified to the great ability of the spherical shape to resist pressure for this type of service.

The vessel broke into nine pieces, ripping from end to end much as an orange would be peeled. All the fractured sections were fairly large with the weld across the widest part of each one. In no place did the break follow the weld. The steel in the formed heads at the axis perpendicular to the weld section was thinned down to a minimum measured thickness of 1.05 in.



THE Sphere, Under 1250 Lb. Air-Pressure Was Lashed to a Flat Car Which Was Run Off the End of a 25-ft. Embankment (Above)
(Lower Left) Examination of the Sphere After the Wreck Disclosed It Was Undamaged. A hydrostatic test to destruction was run after the wreck
(Lower Right) Preparations Were Then Made for the Pressure Test to Destruction. The vessel failed at a pressure of 4500 lb. a sq. in.

Present Status of Nitrided Steels

Manufacture and Properties of Nitralloy, Preliminary Heat Treatment, Hardening Practice, Applications and Expected Developments

FIVE different grades of chromium-molybdenum-aluminum steel are now produced by Krupp in Germany for nitriding, according to Henry A. DeFries, metallurgist Ludlum Steel Co., Watervliet, N. Y., in an address before the New York Chapter of the American Society for Steel Treating, Sept. 19. These range in carbon from 0.12 up to 0.55, but the highest carbon is gradually being abandoned because the long heat at nitriding temperature will lower the hardness of the core to that obtainable in the 0.30 to 0.40 carbon grade. American uses seem to be well served by three grades, carbon 0.15 per cent maximum, 0.20 to 0.30 per cent carbon and 0.30 to 0.40 per cent carbon, all containing normal amounts of sulphur, phosphorus, silicon, and manganese. Other alloys are constant for the three grades: 0.80 to 1.30 per cent chromium; 0.15 to 0.20 per cent molybdenum, and 0.70 to 1.10 per cent aluminum.

These steels are made by the basic process: steel foundries trying to make acid nitralloy castings have consistently failed because much silicon is reduced from the lining and the hardness becomes so high the metal cannot be machined. Even by the basic process it has been so far impossible to make an ingot or bloom larger than 12 in. square sound and free of pipe. Massive parts which would profit by the excessively hard surface induced by nitrogen must therefore be made of some of the other steels, like chromium-vanadium, which may be nitrided, though not so readily.

Harden and Draw Before Machining

The lower carbon varieties of nitralloy in the annealed condition have Brinell hardness of 150 to 160, too soft to machine rapidly. This is corrected by giving a preliminary quench and draw to a hardness of 190 to 220 Brinell. One favorable point argued for the new method of hardening is that it causes no warpage. Mr. DeFries said that this would be true only if the metal had previously been carefully annealed (at a temperature slightly higher than the nitrogen hardening temperature) one or more times to remove all internal strains from previous quenching, machining, grinding and other causes. Such final annealing must be done in an atmosphere which is strictly non-decarburizing—any nitrided decarburized surfaces will flake off easily after final cooling.

Steels of the above mentioned analysis have suitable physical properties for many uses. However, they are not sufficiently strong for service as punches, dies for cutting, stamping or pressing, and other parts where the unit pressure is extremely high. The relatively soft aluminum alloy will flow sufficiently to crack the hard surface and ruin the accuracy of the die. (An exception was noted for mandrels, where the pressure is simultaneous in all directions.) For severe service, 3 per cent chromium steel with low molybdenum, with or without about 0.4 per cent vanadium would be much more suitable. These steels nitride easily and satisfactorily.

Dr. Adolph Fry, the inventor of the aluminum steel, believes that the patented nitralloy steel (with aluminum) gives the maximum surface hardness for a given thickness of case. Other investigators have questioned this, but as A. F. Kinzel of Union Carbide and Carbide Research Laboratories pointed out, this is in many instances due to inaccurate or non-comparable hardness determinations. The ordinary Brinell ball test, even with light loading, breaks through the hard surface, and its indications are valueless other than for judging ductility by the way the cracks spread out. The smaller ball or cone used by the Rockwell machine gives a roughly integrated value of the hardness and depth, and may be useful for production work.

For research work Mr. Kinzel first tried the Herbert pendulum, but discarded it on account of the fact that its indications are not easily converted into other measurements. He favors the microcharacter, which makes a delicate scratch about 0.001 in. deep and requires microscopic observation at 1000 diameters to evaluate. Mr. DeFries noted that the Vickers hardness tester* is much used abroad, and gives figures comparable to Brinell numbers. Timken-Detroit Axle Co., Detroit, tests by file and peen hammer; hardened edges if they possess even a slight radius, should not flake when pounded with a hammer, and flat surfaces should resist the peen end without cracking. Depth of case is most easily determined on round parts by taper grinding and testing with a file.

Simple Equipment Required

Nitriding operation is so simple that Mr. De Fries recommended intending users to make their own experiments to determine the heat treatment cycle best suited for the work in question. According to Dr. Fry a eutectic transformation point occurs at 1200 deg. Fahr., which causes lamination in the nitrided case, and consequently marks the upper limit. Usual working temperature is 950 to 1100 deg. Fahr., and any good furnace can be closely regulated in that range. Merely place the parts to be hardened in a gas tight container, with inlet and outlet pipe, and start a slow uniform flow of commercial ammonia gas through at a pressure of about 1 in. water gage. Exhaust gas (partly dissociated ammonia) should be run into a water stream. Cases of varying hardness and depths can be had by adjusting properly the time, temperature and concentration of ammonia. For instance light, very hard surfaces can be produced in six hours on gages where wear resistance only is needed. A wrist pin, taking alternately stress and wear at heavy unit load, requires 18 hr. or more.†

If some of the part is to be left soft, tin is a good stop-off. First paint the parts to be hardened with Bakelite varnish, then tin the rest of the surface in an electrolytic cell, finally remove the Bakelite film and nitride.

Outlets in Automotive and Steam Industries

Since the nitriding alloys were exploited in Europe several years before the idea was imported to America, the applications over there are more various than are to be found here. For instance, French automobiles commonly used nitrided crank shafts, pinion, and ring gears. Cylinder liners are put into high grade gas en-

(*Concluded on page* 874)

†Many operating details are given in "Working Rules for Nitrogen Hardening," by H. W. McQuaid. THE IRON AGE, May 9, page 1272.

New Metal Forming Mill

Individually-Driven Stands Provide Flexibility—Increased Production Claimed

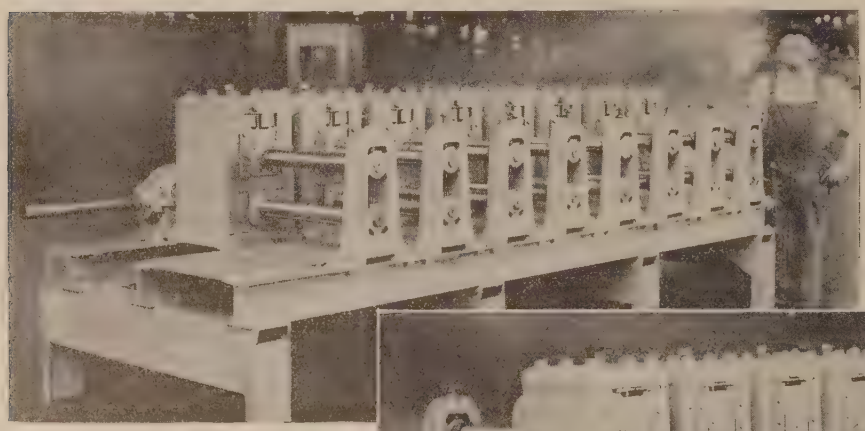
INCREASED production, with more accurate sections and better finish, are claimed for a new type of forming mill that has been brought out by the Farrel-Birmingham Co., Buffalo.

Each stand is an individual unit, and is driven through bevel gears in a cast iron housing, the gears receiving power from a single backshaft driven by one motor. The individual stand houses the spindle bearings, the connecting gears and the mechanism for adjusting the roll centers. Anti-friction bearings, lubricated automatically, are used throughout to assure efficient and smooth transmission of power. The stands are made heavier and stronger than usual in order to provide a solid and stable installation, to improve the quality and finish of the product.

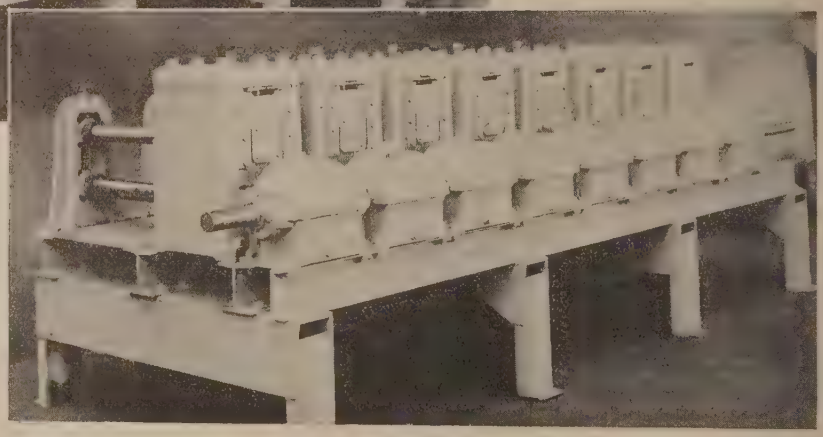
The method of adjusting the top roll spindle is a feature. Both top and bottom spindles are held rigidly to the roll housing during the rolling operation and there is therefore no backlash or wear. The top roll spindle is carried in anti-friction bearings in a single saddle and is placed against the cap by heavy springs and held in place laterally by guide plates. The wedge, which is free to move in and out, is inserted between the top roll spindle saddle and the housing cap, this movement being controlled by a horizontal screw, with a hexagon head, on the outside. To elevate or depress the top roll spindle it is only necessary to turn the hex head of the screw to the right or left. By means of two cap bolts, which pass through the cap of the roll stand and the wedge and are threaded into the top roll spindle saddle itself, the saddle and the wedge can be clamped tightly against the cap when the mill is at work.

Heat-treated alloy steels are used in the construction of this forming mill. Semi-steel is used instead of cast iron for the housing.

With the individually-driven stand, it is possible to add or subtract from the mill from time to time as different shapes of metal are formed. On heavy-production operations a duplicate set of stands can be made ready so that at the finish of one production job the change-over can be effected immediately.



THE Individually-Driven Stand Permits Adding or Subtracting from the Mill as Different Shapes Are to Be Formed. In addition to flexibility, high-production of accurately formed sections is claimed



EACH Stand Is Driven by Bevel Gears Which Receive Power from the Backshaft Driven by One Motor. Anti-friction bearings are used throughout. The method of adjusting the roll spindle is also a feature

---

Simple Optical Pyrometer

A SIMPLE and compact pyrometer, called the Pyroversum, has been designed by Maco Template & Engineering Co., London, (Charles Mitchell, New York, American representative).

The instrument consists of an eye piece and a frame 8½ in. long by 1 in. wide, which carries a special glass throughout its length. One end of the glass is clear; the rest is gradually darkened throughout its length until at the other end it is practically opaque. On one side of the frame is a scale registering from 550 deg. to 1200 deg. C. (or if desired it may be calibrated for Fahrenheit readings). On the frame is mounted a slide having a circular hole in the centre through which the hot body may be seen through the shaded glass. At any convenient distance the user, looking at the object through the hole in the slide, moves the frame along until the glow can no longer be seen. The temperature may then be read on the scale at the left hand side of the slide.

The function of the eyepiece is merely a hood to exclude all other light from the observer than that which comes through the darkened glass. The manufacturers claim that it will measure readily and accurately temperatures of glowing tools, and of melted alloys. The Pyroversum can be carried about in the pocket as easily as a rule, its weight being half a pound. It requires no adjustments, being always ready for instant use.

Foundry Equipment Orders Largest in 12 Months

The index of gross orders for foundry equipment in August was 229.5, the highest figure reached since August, 1928, according to the monthly report of the Foundry Equipment Manufacturers Association. The index for July, 1929, was 219.3. Shipments in August, at 150.8, were the smallest since September, 1928. Unfilled orders on Aug. 31, at 441.1, were the largest since Oct. 31, last year. Average monthly shipments for 1922-23-24 are taken as 100 in computing the indexes.

Improved Société Genevoise Jig Borers

NEW models of the Nos. 4 and 5 jig boring machines built by the Société Genevoise d'Instrument de Physique, Geneva, Switzerland, are being placed on the market in the United States and Canada, by the R. Y. Ferner Co., Investment Building, Washington.

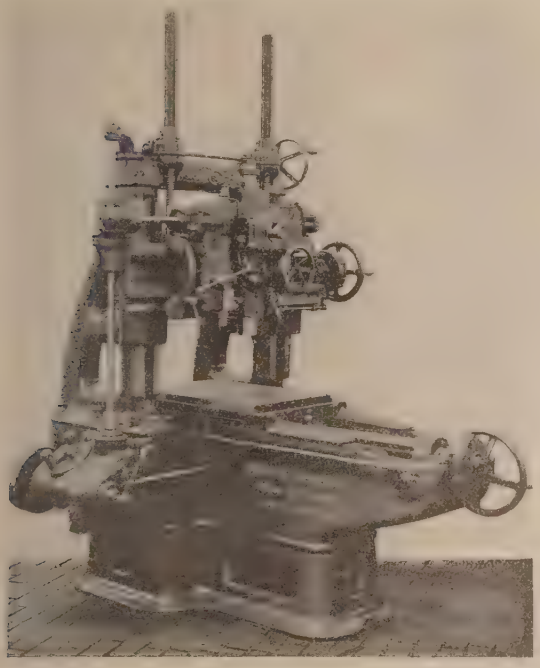
Although the fundamental principles of these machines, which are designated as the MP 4B and the MP 5B, are the same as in the previous models, a number of improvements have been added. Various parts have been strengthened to permit use of greater power and thus increase the speed and the drilling and boring capacity. The vertical housings, tool slide and boring heads are heavier, and a new ribbed design has been adopted for the cross-rail. The diameter of the quill in the main boring head in both machines has been increased and is machined to receive No. 4 Morse taper shanks. Feed of the spindle is now 7 in. A pump for lubricating the main spindle, with sight drip feed controlled by a needle valve, is provided, and a sight feed oiler is used on the high-speed spindle.

The size of the high-speed spindle has been increased to permit use of No. 1 Morse taper shanks, which avoids the necessity of using collets for straight shank tools. The drilling and boring capacity of the high-speed spindle now ranges from 3/64 to ½ in., and the nine speeds range from 212 to 1870 r.p.m. The nine-speed range of the main spindle has also been increased, being from 45 to 400 r.p.m. The drilling capacity of the main spindle is now 1¾ in. in cast iron and 1¼ in. in soft steel, while the boring capacity is 6 in.

With the elimination of collets in the high-speed spindle, a new form of holder has been designed for the guide bushings, to keep the ends of the drills from vibrating. This holder permits convenient insertion of the guide bushing and the tool. Bushings up to 5/16 in. are supplied for holding small straight shank tools, as well as a ¼ in. capacity drill chuck. New accessories include an adjustable boring tool with capacity up to ¾ in., and an extra boring tool of 4 to 6 in. capacity. An adapter is provided for the main spindle so that drills and end mills from ½ to ¾ in. may be used.

The distance between the housings and the width of the table of both machines have been increased to permit handling larger pieces. The method of attaching the rectangular table to the nut of the leadscrew has been simplified, to facilitate installation of the machine. Circular tables furnished with the machines are made higher to permit sliding them to any point on the rectangular table or on a work bench without interference from the handle of the worm-screw. The shaft of the worm-screw is designed to permit quick attachment of any of a set of three indexing disks, which makes it possible to lay out in a circle any number of holes from 2 to 200 without making calculations for the successive settings. These index plates can be attached without removing the micrometer head, and the latter may be used for any setting while the index plate is in place.

Other improvements include a releasing clutch on the handwheel for moving the table; a prismatic microscope and a vertical indicator device for checking the parallelism of the work with the table, measuring the depth of counterboring, or checking two surfaces at different heights, and for a variety of other measurements. A micrometer drum on the hand-feed shaft of both spindles permit exact measurement of the depth of blind holes or counterbores.



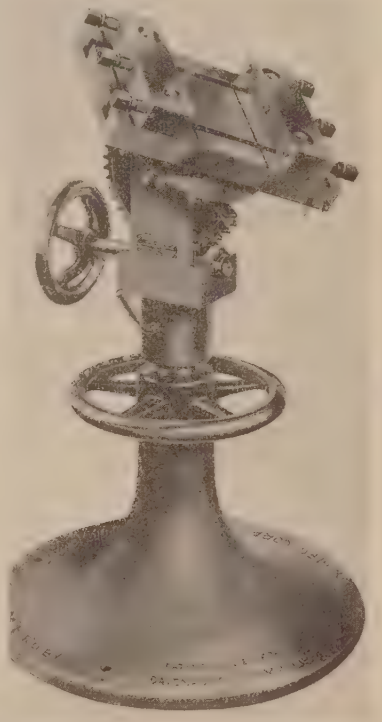
(At Left) Parts Have Been Strengthened and Power and Capacity Increased. Other improvements facilitate operation

* * *

(At Right) The Die in Process May Be Tilted to Any Desired Angle and Adjusted to Any Height

Universal Stand Facilitates Die Making

MAKING of dies is facilitated and floor space is saved by means of the die holding stand illustrated, which has been placed on the market by the Davenport Locomotive & Mfg. Co., Davenport, Ia. The die in process is held firmly in the fixture until completed, and physical handling, and the accident hazard connected with it, are eliminated. Height and angle adjustments may be made conveniently. Two standard sizes, to accommodate blocks weighing up to 1500 and 3000 lb. respectively, are built.



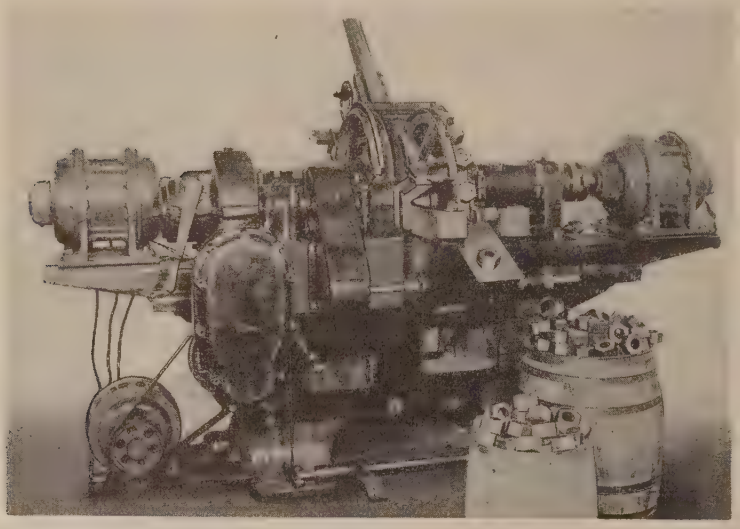
The die holding fixture is made of steel, and has adjustable clamps, one on each side, which slide in accurately machined T-slots. The die is held firmly in place by six machine screws which project through these clamps and engage the groove in the die block. The head fixture is positioned by means of a worm and segment gear and handwheel; it may be set quickly to any position simply by turning the handwheel until the desired angle is reached, and then swinging the entire top assembly, which is pivoted. The work is then locked in this position.

Special Hexagon Nut Grinder

HEXAGON nuts are ground rapidly on the equipment illustrated, which is being introduced by Gardner Machine Co., Beloit, Wis. The machine consists of a No. 84 Gardner grinder to the front of which is secured a rotary attachment with special work-carrier and timing device. On the end of the rotor shaft is mounted a cast-steel disk with a series of studs suitable for the work to be handled. Two side guides are provided to keep the nuts from turning and present them to the grinding wheels in the proper position. On the upper side guide is mounted an indexing device which turns each nut one-sixth of a revolution as it passes, thus presenting two new surfaces to be ground.

After the nut has been ground on all six surfaces, it is ejected automatically from the stud by two vertical arms. These arms, one on each side of the nut, are actuated by a cam arrangement so that the nut passes between the wheels three times before being ejected. In the operation of this device, the attendant is only required to reload the empty stud as it comes around to the loading position.

The unit is equipped with both a hand and a foot-lever which are connected with the friction clutch for stopping and starting the feeding mechanism. This enables the operator to stop the carrier instantly, should it be necessary, simply by stepping on the foot lever. The machine will be demonstrated at the Machine Tool Show in Cleveland next week.



The Attendant Merely Reloads the Empty Stud as It Comes to the Operating Position

6-In. Plain Hydraulic Grinder

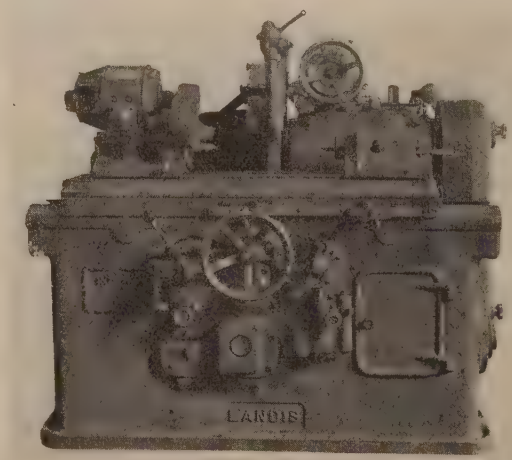
A SIX-INCH plain hydraulic grinder for the rapid production of pistons, axle, stub and pump shafts; small motor armatures and armature shafts; bearings; twist drills; and many other similar small parts, has been added to the line of the Landis Tool Co., Waynesboro, Pa.

A distinctive feature is the hydraulic work carriage traverse with quickly available traversing speeds ranging from 12 to 360 in. per min. A 24-in. diameter grinding wheel is employed. With both electric motors attached to the machine and the water tank made integral with the bed, the machine is completely self-contained.

The base of the bed forms a reservoir for the oil used by the hydraulic traversing system. The work carriage traverses on a V and a flat guide with chilled surfaces thoroughly protected, and spaced to give solid support. Tarry, which is adjustable, is regulated by a needle valve; the usual method of swiveling is utilized.

Steel backed babbitted wheel spindle bearings which are adjustable for wear are used. Continuous spindle bearing lubrication is provided by means of a pump driven by the spindle itself. The oil is filtered before it enters the bearings and the oil gage always visible from front of machine. The spindle is of heat-treated alloy steel and is driven from end by multiple-V belts. An extra spindle pulley is furnished for use after the wheel wears down.

A low-pressure anti-friction bearing traversing oil pump, all parts of which run in oil, is used. The traversing oil motor is of the four impulse, two-chamber continuous type, with all parts running in oil. A throttle valve controls the speed of the motor; a balanced piston-type reversing valve governs the reversal. Grinding wheel cross feed is either automatic or hand operated, in each case through a long feed screw and bronze half nut. Hydraulic pressure working through a small rotary motor actuates the automatic feed. The headstock is driven by an individual dynamically-balanced variable-speed motor, and speed reduction is through a compact double chain arrangement with automatic adjustment. Provision has been made for mounting and driving a d.c. generator at the rear of the machine. The machine designated as the type C, will be demonstrated at the Machine Tool Show in Cleveland next week.



HYDRAULIC Work Carriage Traverse with Quickly Available Speeds, Ranging from 12 to 360 In. per Min., Is a Feature

New Transmission for Trucks

New in the automotive field is a four-speed transmission for 1-ton trucks that is being manufactured by the Clark Equipment Co. at its plant in Berrien Springs, Mich. This new product already is standard equipment on light trucks made by three large manufacturers.

The Clark Equipment Co. also has plants in Battle Creek and Buchanan, Mich. It controls the Frost Gear & Forge Co. at Jackson, Mich. It manufactures front and rear axles, drills, industrial tractors, and trailers, single and dual wheels, and rear axle housings.

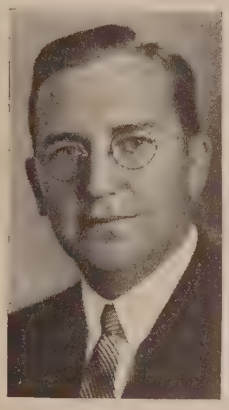
Weirton Group Merger Decided Upon

West Virginia Company Will Be Coupled With Great Lakes Steel and M. A. Hanna Co. Subsidiaries

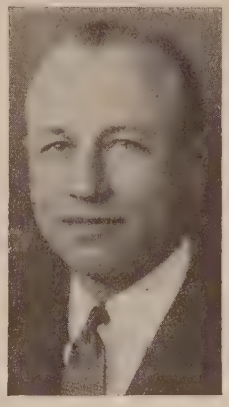
MERGER of the Weirton Steel Co., Weirton, W. Va., Great Lakes Steel Corporation, Detroit, and some of the subsidiaries of the M. A. Hanna Co., Cleveland, now in process of completion, will result in the formation of a completely integrated steel producing organization occupying sixth or seventh place in steel making capacity in the United States.

The Hanna Company owns and operates extensive ore properties and seven blast furnaces, the Weirton company has two blast furnaces, by-product coke plant, semi-finished and finished steel mills at Weirton and mills at Clarksburg, W. Va., and Steubenville, Ohio, while the Great Lakes Corporation has under construction a steel plant at Ecorse, Mich., which will include open-hearth furnaces and steel mills.

ERNEST T. WEIR



GEORGE R. FINK



GEORGE M. HUMPHREY

The financial set-up of the new organization is to be handled by the formation of a holding corporation that will take over the stock of the Weirton and Great Lakes companies and the Hanna subsidiaries in exchange for no par common stock of the new corporation. The name of the holding company and the amount of stock it will issue have not yet been decided upon.

E. T. Weir Slated for Chairman

E. T. Weir, president Weirton Steel Co., is slated to become chairman of the board; George M. Humphrey, president M. A. Hanna Co., chairman of the executive committee, and George R. Fink, president of the Great Lakes Steel Corporation and also of the Michigan Steel Corporation, Detroit, president of the holding company. No specific mention has been made that Michigan Steel will be included in the merger.

The holding company will be a Delaware corporation with headquarters in Wilmington, Del., and offices in Cleveland, Detroit and Pittsburgh. It will have no bonded indebtedness, no prior or preferred stock and no debts aside from the subsidiary obligations. No change in the financial structure of any of the merged companies is contemplated. No new financing will be done. The exchange of common stock of the participating companies for that of the holding corporation will be the basis for consolidation. Assets and security for the prior issues such as the bonds of the Buffalo subsidiary and debentures and preference stock of M. A. Hanna Co. will not be disturbed by the merger. Each merging company will continue to be operated by its own personnel and will retain its present identity.

Physical properties involved in the merger include all the blast furnaces, mines and vessel interests of the Hanna company, the Weirton furnaces and mills and 7000 acres of coal lands in West Virginia and Pennsylvania and the steel plant of the Great Lakes organization. It is stated that the ore reserves of the new company will be exceeded only by those of the United States Steel Corporation and the Bethlehem Steel Corporation. The Hanna interests and their seven subsidiaries form one of the largest producers of iron ore, operating mines on the Mesaba and Cuyuna ranges in Minnesota and on the Marquette, Gogebic and Menominee ranges in Michigan. With its coal lands Weirton has an estimated fuel reserve sufficient for 40 or 50 years. Consequently the holding company is well situated in respect to supplies of ore and fuel.

The nine blast furnaces to be owned by the holding company include five in Buffalo of the Buffalo Union Furnace Co., two in Detroit of the Hanna Furnace Co. and the two Weirton furnaces. The total annual pig iron capacity of these stacks is rated at over 1,500,000 tons. By-product coke for the blast furnaces will be supplied through ownership of one-half interest in 150 Koppers ovens of the Donner-Hanna Coke Corporation, Buffalo, with an annual capacity of 700,000 net tons and 86 Koppers ovens at Weirton having an annual capacity of 550,000 tons.

The total ingot capacity will be approximately 1,800,000 tons, of which Weirton will supply 1,200,000 tons and Great Lakes 600,000 tons. This will place the holding corporation slightly under the Republic Iron & Steel Co. in ingot capacity. Products of the semi-finished mills will be slabs, sheet bars and billets. Finishing mills will produce sheets, strip, continuous strip, hoops and bands and black plate for tinning. Weirton has a capacity for producing annually 360,000 tons of hot strip, 120,000 tons of cold-rolled strip, over 100,000 tons of sheet products, over 400,000 tons of wide strip and light plate products covering a wide range, and an annual capacity of 5,550,000 base boxes of tin plate, it being the second largest producer of the latter product. The plant of the Great Lakes Steel Corporation will have hot and cold-rolled strip mills with an annual capacity of 400,000 tons.

New Company Favorably Situated

The new company with its own ore mines, vessels, blast furnaces and mills will be favorably situated in respect to both raw materials and consuming markets. The Weirton company is already an important factor in the Michigan steel market, which is constantly being expanded by the demands of the automotive industry. Weirton, being situated on the Ohio River, receives its coal by water and can ship its products by barge to Cincinnati, St. Louis and other Ohio and Mississippi River points, and can enter the South and Southwest with a saving of $2 to $3 a ton as compared with the all-rail transportation costs.

The M. A. Hanna Co. by the merger will expand its outlet for ore, coal and pig iron. The Hanna furnaces in Buffalo have for some time been shipping considerable pig iron by water to Detroit and other Michigan ports and reaching the eastern seaboard by the Erie Canal. The Great Lakes plant at Ecorse is only about one mile from the Hanna Detroit blast furnaces and some time ago the Hanna company entered into an agreement to supply the Great Lakes plant with hot metal from its Detroit furnaces. C. A. Collins, president, Hanna Furnace Co. and vice-president of the M. A. Hanna Co., is a director of the Great Lakes Steel Corporation.

Ernest T. Weir, president, Weirton Steel Co., who will become chairman of the board of the new steel holding company which is to absorb the Weirton company, the Great Lakes Steel

Corporation and subsidiaries of the M. A. Hanna Co., started his steel career as a clerk with the Braddock Wire Co., later going with the Oliver Wire Co. In 1898 he became assistant to the district manager of the American Tin Plate Co., Pittsburgh, advancing to manager of the works in 1900, and three years later he was appointed manager of the Monessen works of that company. In 1905, with James R. Phillips of Pittsburgh, he organized the Phillips Sheet & Tin Plate Co., serving as secretary and general manager until 1908, when he became president. He built the town of Weirton, W. Va., and erected a 20-mill tin plate plant there in 1909-1910. At about the time of the change of name to the Weirton Steel Co. the company acquired the plants of the Jackson Iron & Tin Plate Co., Clarksburg, W. Va., and the Pope Tin Plate Co., Steubenville, Ohio.

George R. Fink, who will be president of the holding company, is president of the Michigan Steel Corporation and the new Great Lakes Steel Corporation. He organized the Michigan Steel Corporation several years ago and built a sheet mill near Detroit, and his success in this venture encouraged him to undertake the organization of the Great Lakes Steel Corporation, which he financed to the extent of $20,000,000 by his own efforts without any bank underwriting. Automobile manufacturers, bankers and others, including the M. A. Hanna Co., took stock in the new corporation, the purchasers numbering about 300. Mr. Fink, prior to his organization of the Michigan Steel Corporation, was for several years general sales manager of the West Penn Steel Co., which is now a part of the Allegheny Steel Co. He started his work in the steel business in the West Penn mills and came up from the ranks. During the war he was a captain in the Ordinance Department and was stationed in Washington. His promotion to general sales manager of the West Penn Steel Co. came after his return to his active duties after the Armistice. Mr. Fink is a director of the Union Trust Co., Detroit.

George M. Humphrey, president, M. A. Hanna Co., Cleveland, who will become chairman of the executive committee of the new holding company, used the legal profession as a stepping stone to a conspicuous place in the iron and steel industry, which he has attained at an early age—he is still under 40. Born in Saginaw, Mich., in 1890 and graduated from the University of Michigan in 1912, Mr. Humphrey was admitted to the bar in the latter year and took up the practice of law in Saginaw, following in the footsteps of his father, who was a prominent member of the Michigan bar. He joined the M. A. Hanna Co. on Jan. 1, 1918, as general attorney. In 1924 he was made vice-president and director of the company including all of its subsidiaries. He became president of the Hanna company in January, 1929. He is also a director and member of the executive committee of the Republic Iron & Steel Co.

Program Announced For Concrete Steel Meeting

The Concrete Reinforcing Steel Institute, which will hold its semi-annual meeting at the Hotel Wawasee, Wawasee, Ind., Sept. 30 to Oct. 2, inclusive, has announced a program which includes the following addresses: "Market Extension," by George E. Routh, Jr., vice-president Kalman Steel Co., Chicago; "Inspection of Reinforcing Steel," by James F. Curley, vice-president, Concrete Steel Co., New York; "Pacific Coast Market Conditions," by Charles M. Gunn, president, Gunn, Carle & Co., San Francisco; "The Meaning of Modernism," by Harvey Wiley Curbett, New York, chairman of architectural commission of Chicago World's Fair to be held in 1933; "The Road to Real Profits," by Arthur Fisher of firm of Butler, Lamb, Foster & Pope, Chicago.

General Motors Buys North East Electric Co.

General Motors Corporation has purchased the North East Electric Co., Rochester, N. Y., manufacturer of automobile electrical parts. Alfred P. Sloan, Jr., president of General Motors Corporation, announced that the purpose of the acquisition is to expand the manufacturing facilities of General Motors in the electrical field. Payment for the Rochester company was made in stock of the General Motors Corporation aggregating $13,000,000 at recent market.

The Week in Business

Drift of Current Financial and Economic Opinion

THE nervous tone of the stock market has again focused attention on the credit situation, which has been the only fly in the prosperity ointment.

It can still be said, in the words of the September bulletin of the National City Bank of New York, that tight money has not yet harmed any major business activity except building. But, according to D. W. Ellsworth of the *Annalist*, ordinary business enterprise faces a dilemma. If the securities market declines, business will suffer a sentimental reaction; if the flotation of securities goes on much longer at its present rate of increase there is danger of credit scarcity.

"Outside" Call Loans Not Exhausted

Such a shortage is not imminent, in the opinion of the Alexander Hamilton Institute, which believes that "outside" call loans are far from exhausted. Brokers' loans, despite the Federal Reserve's consistent efforts to curb them ever since February, have reached a most unprecedented total at $6,569,000,000, compared with $4,470,000,000 one year ago. Loans from non-banking sources account for $3,626,000,000 and the institute estimates that this amount could even be tripled, dividing the funds available as follows:

$2,000,000,000	available from investment trusts.
5,652,000,000	available from working cash of domestic corporations.
3,000,000,000	available from domestic and foreign private investors, foreign corporations, brokerage houses direct.
$10,652,000,000	

Still further increases in outside loans can be expected, in the opinion of the Alexander Hamilton Institute, until a turn in business results in less use of credit and less attractive rates.

So long as the high cost of credit is not replaced by actual credit scarcity, prosperity is likely to continue, according to Col. Leonard P. Ayres, Cleveland. He sees no shortage near and looks for a record volume of autumn industrial output.

Stocks Selective, Industrial Profits Large

THE upward surge of brokers' loans, while doubtless making for tight money, has not caused a sweeping rise in securities prices. On the contrary, more stocks have gone down than up since the beginning of the year. The selective character of the market doubtless accounts for persistent faith in its soundness. Illustrative of this undisturbed confidence are reports from Europe to the New York *Times* reflecting a feeling that the recent reaction in the New York exchange is only of a passing na-

Contest On Over Southern Pig Iron Rates

Northern Producers and Railroads Oppose Proposed Reductions—Appeals Considered

WASHINGTON, Sept. 24.—Briefs have been filed with the Interstate Commerce Commission in connection with the proposal of Southern carriers to reduce rates on pig iron from Birmingham and other Southern producing points to the St. Louis district and intermediate destinations in Indiana, Illinois, Missouri, Iowa, etc. Typical of the tariffs now under suspension is one which would reduce the rate from Birmingham to St. Louis from $4.42 to $3.69 a ton, a cut of 73c.

Opposing the efforts of the Southern lines and producers to reduce the rates are Central Freight Association carriers and Northern producers. One of the arguments made for the proposed reductions is that they are necessary to meet competition with Chicago, Milwaukee, Duluth, Minn., and Granite City, Ill. Among claims made by Northern producers is that the proposed adjustment is a deliberate attempt to permit long distance competition at their expense as well as that of Northern carriers. It also is contended by the Northern railroads that the adjustment would upset the pig iron rate structure of Central territory because Northern producers would insist upon reduced rates if rates from Southern furnaces were lowered.

Further, the Central territory carriers said the adjustment would upset relationships as between origin points as well as at destination points and would result in very little if any increase in the movement of pig iron from the South. These carriers also protested that by reason of the failure of the southern lines to propose reductions to Ohio River points and Central Freight territory an unduly preferential situation would result.

In contending for the reductions, the position of Southern lines and producers was outlined by J. G. Kerr, assistant to the traffic vice-president of the Louisville & Nashville, who said that with the gradual but sure elimination of Southern iron from Northern markets and the relatively small demand for pig iron in the South, the Southern pig iron industry has got "into a very distressed condition." He declared that on July 1, 1929, 468,136 tons of pig iron was stored at Alabama furnaces, comparing with 237,793 tons on July 1, 1928; 164,589 tons on July 1, 1927 and 105,984 tons on July 11, 1926. The carriers were declared to have established low rates to South Atlantic and Gulf ports in an effort to relieve the situation "but at best such relief can not be very great."

The consumption of pig iron in the St. Louis district was said to be approximately 300,000 tons annually. In the five-year period 1910-1914, according to Mr. Kerr, the all-rail movement from Southern producing points to the St. Louis district was 33,772 tons annually, or about 11 per cent of the consumption, "assuming that it has not increased since that time." During the five-year period 1924-1928, the all-rail movement from Southern producing points to the St. Louis district was said to have been an average of 5807 tons annually, representing less than 2 per cent of the total consumption.

The rate on pig iron from Chicago to St. Louis is $2.16, leaving a spread of $2.26 under the present rate from Birmingham. It would be reduced to $1.53 if the proposed rate of $3.69 went into effect. The rates from Milwaukee and Duluth to St. Louis are $2.87 and $4.26 respectively.

Screw Machine Products Association Meeting

A joint meeting of the Screw Machine Products Association and the Screw Machine Products Institute will be held at the Hollenden Hotel, Cleveland, Tuesday, Oct. 1.

Accomplishments of the Institute, which is directed by Dr. A. E. Swanson, since its formation last January, will be reviewed at the morning session, and standard cost classifications, uniform estimate sheets and other subjects will be discussed during the afternoon. Malcolm Baird, 232 Delaware Avenue, Buffalo, is field secretary of the Screw Machine Association.

---

ture, out of keeping with the "extremely favorable" American industrial outlook.

Business prospects cannot be appraised without mentioning industry's highly satisfactory profits, bespeaking greatly expanded purchasing power. The first-half net earnings for over 900 corporations, tabulated by the National City Bank of New York, showed a gain of 27 per cent over those of the first six months of 1928.

Expanding Investments in Foreign Industries

THE foreign trade outlook, especially now that the tariff is being debated, remains a baffling uncertainty. The dire prophecies that followed the armistice have failed to materialize. With Europe heavily in debt to us and with apparently no alternative but to flood us with goods, our favorable foreign trade balance nevertheless continues.

One explanation of this apparently anomalous situation is the lending of funds to foreign buyers. Curiously, long-term loans on foreign account thus far in 1929 are only about one-half as large as in the same period last year. It takes time for such curtailment to affect trade and some adverse results may soon become manifest; then again this development may be offset by other factors in the complex ramifications of our world economic relationships.

The flow of interest to foreign lenders on the New York call money market is by no means inconsiderable. E. C. Harwood, writing in the *Annalist*, says that France has three-quarters of a billion dollars invested in the American short-term money market, and that the amount held for all Europe probably exceeds a billion. In addition, American industry's increasing acquisition of stock in European companies is transferring huge funds to foreign account.

Stock Market Is Vulnerable

IN a business situation that has so much to commend it, especially in the high level of employment and the absence of commodity speculation and swollen inventories, a note of warning is sounded by the conservative *Commercial and Financial Chronicle*. "The prevention of money panics is not an insurance against sudden and widespread credit depression when loans are wanting because of general want of confidence," it says, in commenting on the strong position which the banks now enjoy under the Federal Reserve System.

"And it is a long road that has no turning. Nor can anyone predict when the turn will come . . . When, however, the millions of investors, owners, projectors, workers, businesses large and small, *realize* that the end is coming or has come to a fictitious 'prosperity' and change from prodigality to curtailment, from spending to saving, from gratifying wants to nursing needs, *then* the word finis will be written not only on the 'longest bull market in history,' but on a dream of 'perpetual' prosperity that has never had its equal in the annals of any people."

Institute Visits North East Coast

Important British Steel Producing, Shipbuilding and Machinery Making Plants Act as Hosts to Ironmasters

NEWCASTLE-UPON-TYNE, ENGLAND, Sept. 12.—It is 52 years since the Iron and Steel Institute held its first meeting in the North East of England. The successful meeting held this week in the same area closed with only one regret —the illness of Sir Hugh Bell, whose father was one of the founders of the institute.

The meeting was held at the North East Coast Exhibition, where the basic industries are well represented. This is the birthplace of hydraulic power, large ordnance, and the steam turbine; many of the largest contracts for this class of machinery continue to be placed in this area. The district is also a center for coal mining, the manufacture of iron and steel, and for shipbuilding.

Leading engineering and metallurgical companies acted as hosts at a luncheon given on each day of the meeting; the afternoons were devoted to visits to local works.

The manufacture of plant for the dry cleaning of coal was witnessed at the works of the Birtley Iron Co., which holds the English rights for the Sutton, Steele & Steele Process. The Birtley company, it may be mentioned, pioneered in the manufacture of vertical cast iron pipe.

Vickers-Armstrong Busy on Heavy Work

In spite of the general reduction in armaments, the Elswick works of Vickers-Armstrong at Newcastle still remains, to a large extent, an armament producing works. Steel castings up to 25 tons are being produced; modern facilities for machine molding are in evidence for railroad wheels and other items where multiple production is possible. An extruding press of modern design, and three electric furnaces, capable of producing 100 tons of ingots per week, have been installed. The Elswick works includes one of the largest drop forging plants in Great Britain, and this department has recently become part of the English Steel Corporation, Ltd., a new company which has been formed to embrace the steelmaking and forging works of Vickers-Armstrong, Cammell Laird & Taylor Brothers of Manchester.

Foundries of the North Eastern Marine Engineering Co., at Wallsend have an annual capacity of 6000 tons. The plant includes seven cupolas, the largest of which melts 8 tons an hour. This company was the first British licensee of the Lanz process for the production of Perlit iron and also manufactures, under license, another high duty iron called Emmel iron.

Equipment for Annealing and Galvanizing Large Plates

Consett Iron Co. was also visited. Its plant contains eight blast furnaces, six 75-ton acid and three 65-ton basic open-hearths, arranged for either producer or coke oven gas and equipped with waste heat boilers. Plate mills have capacity for making 2-in. plates, 9 ft. wide, and have such labor saving devices as turn-over gears and Ennis plate manipulating tables. An annealing furnace with charging machine capable of dealing with plates up to 44 ft. long by 9 ft. wide, to be fired with coke oven gas, is being erected.

At Palmers Shipbuilding & Iron Co., Jarrow, steel manufacture is carried on by the open-hearth basic process, while the galvanizing plant is one of the largest in the United Kingdom, being capable of an output of 10,000 tons per annum. Plates up to 45 ft. long and bars up to 60 ft. can be handled.

South Durham Steel & Iron Co., of which Benjamin Talbot, past president of the institute, is managing director, has works at West Hartlepool and steel plate mills at Stockton. There is also a plant turning out hammer-welded steel pipes 12-in to 100-in. diameter, 30 ft. long and up to 2 in. thick.

The Redcar Works of Dorman Long & Co. are a self-contained unit consisting of coke ovens with by-product recovery, blast furnaces, basic open-hearth melting shop and plate mills. From the time raw materials are delivered to the final dispatch of plates, the material progresses in a straight line, through blast furnaces, steel furnaces, soaking pits, cogging mill, reheating furnace, plate mills, cooling banks, and stock bays to the railroad sidings or the company's deep water wharf.

Bolckow, Vaughan & Co. have 13 blast furnaces in commission, in four separate groups, having a yearly output of approximately 750,000 tons of pig iron. Steel is produced by 15 60-ton open-hearth furnaces, with an annual capacity of 500,000 tons of ingots.

Freight Burden on Scrap Called Too Heavy

Institute of Scrap Iron and Steel Says Old Material Pays More Than Pig Iron or Iron Ore

SCRAP iron and steel, although waste material, carries a greater freight burden than pig iron, iron ore and some manufactured products, according to a report issued by Benjamin Schwartz, director general of the Institute of Scrap Iron and Steel, which emphasizes the increasing part played by scrap iron and steel in the steel industry and its importance as a source of revenue to the railroads of the United States.

In 1928, Class 1 railroads of the United States carried 11,746,937 tons of scrap, earning $24,863,015 in freight revenue, the report says. This total of freight revenue, equalling 14.37 per cent of the value of all scrap at destination, represented approximately 15c. of every dollar paid for the purchase of scrap. The report adds:

"The freight burden carried by scrap is higher than pig iron, represented by 9.37 per cent; passenger automobiles, represented by 4.21 per cent; manufactured iron and steel articles, represented by 4.19 per cent, and is greater than many other essential commodities and manufactured articles. Scrap iron and steel carried more than double the freight burden of all commodities transported on the railroads of the United States, the proportion of the value for all commodities being 7.08 per cent.

"The average freight revenue per ton of scrap iron amounted to $2.12, a higher revenue than iron ore, which averaged $1.15 a ton, or pig iron, which averaged $1.76. The total tonnage of scrap was greater by 32 per cent than the total tonnage of pig iron carried by the railroads, or 3,713,421 tons more than pig iron.

"The total of approximately 12,000,000 tons of scrap iron and steel carried by the railroads in 1928 is not only evidence of the tremendous growth of the scrap iron industry as one of the country's essential businesses, but attests to the increasing use and importance of scrap to the steel industry. In 1913, the scrap industry, as a steel making factor, was small, in view of the fact that steel production exceeded pig iron production by only about 1 per cent. In 1928, however, ingot production exceeded pig iron production by 36 per cent, the difference being made up by scrap."

The report also indicates to the railroads the desirability of increasing the revenue from scrap transportation, by reconsidering the freight rate structure, so that a freer movement may result, with longer hauls. It is stated that the rates applicable to scrap iron today have erected tariff walls which have restricted markets and the free movement of scrap.

Wisconsin Steel Co., Chicago, has had no lost-time accidents in the stores department since Jan. 31, 1924, and none in the office department since Feb. 16, 1927.

This Issue in Brief

To avoid flaking after nitriding, the annealing operation prior to nitriding must be done in a strictly non-decarburizing atmosphere, for any nitrided, decarburized surface will flake off easily after final cooling.—Page 841.

* * *

Cast iron reheated to between 700 and 750 deg. C., followed by air or water cooling, causes Brinnell hardness to fall from 228 to 130. But if heated to above 800 deg. C., and cooled similarly, increased hardness to above 270 Brinell results, and a pearlitic structure is evident.—Page 826.

* * *

Nitrided tools to stand severe service, such as punches and dies, should be made of steels with about 3 per cent chromium and a low molybdenum content. These steels nitride easily and satisfactorily.—Page 841.

* * *

Staged railroad wreck fails to damage welded steel vessel of 1½-in. plate, under 1250 lb. air pressure. Bursts finally under hydrostatic pressure of 4500 lb. per sq. in., but in no case did the break follow the weld. — Page 840.

* * *

To weld thin sheets successfully suitable clamping apparatus is necessary. For when heat is applied a distortion or displacement occurs in three directions. The backing device must be somewhat flexible and yet exert sufficient force to clamp and hold the joint edges evenly together.—Page 834.

* * *

Harmful effect on zinc-base die castings of small traces of tin, lead and cadmium has resulted in a considerable unwanted tonnage of scrap castings. Though the selling price may be but 10 per cent of the original cost of the component metals, there are no buyers.—Page 831.

Reduction of weight one pound is worth $40 to aircraft builders, says Dr. Jeffries. Beryllium is lighter than aluminum, and alloyed with aluminum it has a tensile strength of at least 70,000 lb. per sq. in. But it costs $200 a lb. When and if it gets cheaper it will be an important factor in aircraft construction.—Page 833.

* * *

Harmful lead removed from copper scrap remelted for wire making by oxidizing the furnace charge thoroughly. A slag with equal parts of lime rock and sand is made up, and the bath is blown with air.—Page 831.

* * *

For cleaner basic open-hearth steel, engineer suggests separating the metal and slag after the oreing operating and finishing under a reducing refining slag. But whether or not this would be economical and just how the metal and slag can be separated are not known.—Page 827.

* * *

Poor ductility of steel castings is often due to deficient arrangement of sulphide inclusions, analyses reveal. Alumina is not always to blame. The inclusions may be alumina, sulphides or silicates.—Page 828.

* * *

"Accidental selection" is source of obtaining capable development engineers. Present educational systems do not produce men of type required. Engineers with good knowledge of general physics are preferred to physicists specializing in one branch.—Page 824.

* * *

When should a wire rope be scrapped? The increase of the rate of stretch appears to be the most useful indication. — Page 833.

Vacuum melting may improve quality of basic open-hearth steel. The best possible reduction product of FeO is CO. Favoring the formation and elimination of CO by evacuation will be along the line of least resistance. — Page 827.

* * *

Nitriding for 6 hr. will produce a satisfactory surface where wear resistance only is needed, as in the case of gages. Parts taking alternately stress and wear at heavy unit loads, such as wrist pins, require as much as 18 hr. or more.—Page 841.

* * *

Welds in galvanized metal are not weakened by the zinc oxide from the burning coating, even when made with a steel rod. However, high-strength bronze is the preferred welding material.—Page 839.

* * *

High-grade brass pressure castings can be made from reclaimed metal, manufacturer believes. Raw materials should be examined with scrupulous care and molten metal must be properly "cleaned."—Page 831.

* * *

Forgings of plain carbon steel have banded structures in 75 per cent of the cases, says manufacturer. Structures can be removed by a high-temperature anneal. But metallurgist declares that such structures should not be present. —Page 829.

* * *

Finds 416 fissures in 1000 miles of track tested. Though cause of fissures is unknown, engineer believes some condition occurs during fabrication that introduces peculiarities from which fissures later develop.—Page 829.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

And Now Beryllium

SOME among us who are not yet old men remember when aluminum was a rare metal. The dentist who used a little aluminum mallet in plugging teeth was a very up-to-date artisan. In 1928 the world produced 225,000 tons of aluminum, which in terms of weight was 50,000 tons more than the production of tin, and in terms of volume was more than half the production of lead.

It is an intriguing speculation whether some of the other metals that are newly coming into use—cadmium, chromium, magnesium, beryllium and tantalum —will in 50 years repeat the extraordinary development we have seen in aluminum.

Among those we have mentioned, cadmium—the little sister of zinc—is by no means new. It is of common occurrence in zinc ore and a little of it has been produced commercially during 50 years back; but on the whole it has been a nuisance to zinc metallurgists and they have not known what to do with it. A few years ago they were thinking that if they could see their way clear to produce it for sale at about 25 cents per pound they might find a market for it in quantity for pigment purposes, its sulphide making fine yellows. During the last year or two, however, it has come into insatiable demand at a price rising toward $1 per pound. The reason is electroplating with it, for which purpose its silvery, untarnishing luster is far more agreeable than that of zinc, and some say is superior to that of chromium.

The chromium-plated fittings of automobiles are becoming familiar to everybody. Chromium plating is now done in local shops. It is still pretty expensive, especially for local repair or refinishing jobs, but we may foresee that in the course of time it will go a long way toward displacing nickeling.

Among the very new metals none are more fascinating than tantalum and beryllium. The former has properties that approach those of platinum. The latter is lighter even than aluminum, having a specific gravity of only 1.84. Yet it has a modulus of elasticity of 27,500,000 pounds per square inch, almost up to that of steel, and the alloy of 70 per cent beryllium and 30 per cent aluminum has a tensile strength of 70,000 to 100,000 pounds per square inch. Obviously this metal and its alloys may play a part in aircraft construction. At Pittsburgh last week it had a leading place in the discussions of the electrochemists there gathered.

On account of its high cost at present—about $200 per pound—there has not been much technical study of it as yet. It is suggested, however, that with a quantity demand for it the cost might be reduced to somewhere between $25 and $50 per pound. It is said, moreover, that the aircraft builder can afford to spend $40 to reduce the weight of an airplane one pound.

The ore of beryllium is the mineral beryl, which contains only about 5 per cent Be, wherefore the cost of extraction of its metal will inevitably be high as compared with other metals. Apart from that unfavorable condition there is the surprising estimate by geologists that there is as much beryllium by weight in the earth's crust as there is lead or zinc, and a whole lot more by volume.

Changes in New Construction

FABRICATED steel orders in August, as our news columns have shown, were the highest on record. Similarly, for the first eight months of the year there was the greatest total ever reported, a 19 per cent increase upon 1928. Coincidently, residential construction has dropped to 30 per cent of the total, against 40 to 47 per cent in monthly reports for several years. Home and apartment building in the first eight months of 1929 declined no less than 26 per cent from last year, whereas industrial building in the same period gained 40 per cent and commercial building gained 5 per cent.

Sustained activity in general trade and manufacturing have made it possible to continue commercial and industrial construction on a large scale, in spite of the high cost of borrowed money. Important industrial companies have not only had their own funds for new construction but have been lenders in the call money market. At the same time the combination of dear money and curtailed demand for long-term mortgages has sharply cut down the building of houses and apartments. The same influence has brought declining activity in the real estate market, with the expectation that this condition will continue and may be accentuated.

Expanding operations in public works and utilities have been a factor, the former being covered by current taxation—notoriously high—and the latter in some cases by new issues of stock by utility corporations.

Thus the whole situation ties back to the problem of money supply. And now the coming of better days for the real estate market and of renewed activity in the building of homes will depend in large measure on the return to their accustomed uses of funds long diverted to speculation. That again will be determined by the time required to bring stock prices to a basis more nearly representing normal earning capacity.

A German View of Social Insurance

SOCIAL insurance in its broader aspects, compulsory under the statutes, has many advocates in America, chiefly among certain representatives of union labor and among social reformers, who find a panacea for industrial ills in such measures as insurance against sickness and other disabilities, unemployment insurance and old age pensions, all at public expense. Great Britain has given the plan a long and thorough test and many of the best minds call it a failure. Germany, too, has social insurance, and here in brief is the estimate of its results given by Dr. E. Lick of Danzig:

> The sickness insurance has needlessly made invalids of large numbers of our fellow citizens, has raised to the rank of a profession the condition of being sick. The invalidity insurance has deprived many men prematurely, first of the desire to work and finally of the ability to work; and the accident insurance law has created pension mania, the struggles for pensions with the emotional disturbances and the scandal of simulations. The tremors of war neuroses stopped instantly with the Armistice. Similarly, but with greater intensity and persistency, a wave of cures would sweep through the German people if the social insurance could be suppressed.

Dr. Lick's arraignment, whether or no exaggerated, voices the opinion held by many Americans as to what would happen were the United States to take on European methods of dealing with industrial workers in the effort to improve the conditions under which they live.

Social insurance has made some progress in this country. Its proponents are tireless and insistent, as is demonstrated by the mass of petitions and bills with which Congress and the State legislatures are besieged each year. In a few States these efforts have had some measure of success, particularly in the matter of old age pensions. But the practical operation of these statutes has not been satisfactory. A prime objective, to remove the stigma of pauperism from financial assistance to needy persons, has not been attained. Nor can it be, unless the system provide that the persons later to be aided share in the cost of establishing the necessary funds. Yet at its best social insurance in industry savors of something that does not appeal to the make-up of the great majority of the American people.

APROPOS of the near-proverb that one can prove anything by statistics: The editor of *Engineering* bemoans the fatality rate in British passenger traffic, observing that "the toll was much heavier than usual, and certainly more than we would like to see." Out of 1,670,000,000 passengers carried on the railroads, 48 were killed. Analysis of the report, however, shows that two bad accidents were responsible for 41 of the 48 deaths, and that both of these were caused by the failure of engineers to obey signals. We, on the other hand, would use these statistics to congratulate our cousins overseas on an extraordinary degree of safety. Or, interpreting them in another way, to congratulate the steel makers and railroad engineers upon the almost absolute reliability of the mechanical equipment. In fact, the six accidents classed as most important in the list for 1928 were all due to failure of the human element. "True as steel, strong as iron" means something to British railroad patrons.

Decline in Automobile Output

AUTOMOBILE production decreased a trifle from July to August, which is contrary to the more common experience, since the offering of new models usually stimulates August business. Together the two months ran 9.3 per cent under the average rate for the first half of the year. Production in both months was greatly helped by the good rate of Ford operations, Ford having been behindhand in deliveries. Accordingly the augury is that the last four months of the year will not hold up to the average relation with July-August production.

Automobile trade conditions have fluctuated so widely that nothing like a standard of seasonal variation has been set up. In the last six years the decrease in production from the first half to the second half has varied as follows:

	Per Cent
1923	3.3
1924	22.2
1925	2.7
1926	18.5
1927	37.3
1928	2.2

Here were three large decreases and three small decreases. The average of all six is 14.4 per cent, which has some suggestiveness, but as an augury for the future there is the weakness that those six years witnessed almost the entire swing from open cars to closed cars, which had a strong tendency to stimulate purchases in the late months of a year. For the future one may fully expect that there will be a smaller autumn buying season relative to the spring season, or none at all.

Observing the most recent trend, it is doubtful now whether the last four months of this year will record as heavy production as there was in the last four months of last year. That is, while this year to Sept. 1 accumulated a lead of 1,207,086 over last year, in the total number of cars and trucks produced in the United States and Canada, there are chances that the remaining four months will cut down the lead instead of adding anything. Total production last year was 4,601,141, and this year's total may easily be under 5,800,000.

The human element is a strong factor in determining automobile purchases. By no means is it a mere question whether one can afford a new car or whether the old car is too nearly worn out. Sometimes it is the style to buy a new car, sometimes not. In his latest Cleveland Trust Co. circular Col. Leonard P. Ayres presents diagrams showing how rapidly automobile styles have changed, whereby new buying has been induced, there being the swing from open to closed cars, from high-pressure to balloon tires and from two wheel brakes to four, and he suggests that the automobile industry "has not lost its ability to make us feel that the old car ought to be traded in and a new one bought to take its place." Also he says, "The industry still thrives on dissatisfied customers." It is a question, however, whether the makers can propose sufficiently radical changes in

future. We must remember, too, that recent production has included a large proportion by Ford, and Ford is altogether unlikely to make any sweeping change.

Need of a Sense of Proportion

COUNTLESS blunders have been made in trade through failure to appreciate the need of eventual proportion, and sometimes the correction of the false idea has involved hardship to those who made the blunders. There was the deservedly famous "rule of doubling" in pig iron. Six decennial totals of pig iron production, through 1913, showed a virtually perfect adherence to the rule both decade by decade and in the whole range, for production in the ten years through 1913 was 33.6 times production in the ten years through 1863, when the rule would call for 32. The performance was out only 5 per cent and that was on the good side. But what would you have for the future? In substantially the same half century, 1860 to 1910, population was multiplied by 2.92. In essence, per capita consumption was multiplied by 11.5. But carry any of the figures out for a century more. Population would be 785,000,000, which may seem absurd; but grant it for what is to follow. Per capita consumption would be multiplied by 132. Production would be multiplied more than a thousandfold, to about 25 billion tons a year.

The point is simply that there are other things to do than beget children, receive immigrants, produce pig iron and consume pig iron. Our activities must be in proportion. Putting it mathematically, geometric increases must break down, while successive decrements may be all right. By mechanization of industry we may reduce laboring time and increase leisure time. We may increase leisure by 10 per cent successively for a few quinquenniums, but for ten, or only a half century, that would be multiplying by 2.6. Quite conceivably we may reduce working time by successive decrements of 10 per cent. There would always be more laboring time left, but we cannot increase leisure to more than 24 hours.

In the last 20 years many foolish predictions have been made about railroad expansion and railroad buying. There has been disappointment and motor vehicles have been the alleged cause of the breakdown of a supposed "rule." Not at all. For a long time railroad freight ton-mileage doubled quite regularly every 12 years. That could not keep up. Some of our requirements, as for food, do not increase per capita and when things are carried long distances at the outset we are apt to develop nearer sources or we ourselves may move.

Today there is a host of trends in individual trade activities that cannot continue indefinitely at their present pace, however plainly marked one may think he sees them in the statistics. The man with a sense of proportion recognizes the natural limitations, whereby he is likely to prosper, and he contributes to our happiness by not trying to force us to believe in rules that will not work out.

Impending Revolution in Rolling Mill Equipment

The steel mill engineer has evolved a heavy complex. His problems have always been big problems and his solution of them, big machinery of heavy proportions, large bed plates, large bearings, large shafts, large factors of safety. The tendency now is to replace heavy, complicated castings by lighter, cheaper and stronger units. The development of light material handling equipment has been toward the use of steel of high tensile strength in order to reduce weight and the effect of impact of heavy electrically propelled loads. The same development of light high tensile strength equipment permits flexibility of installation.

A nationally known industrial economist believes the profits of the next five years will be largely those resulting from improved material handling in the minor jobs, which have heretofore been considered as relatively unimportant.

The industry seems to be on the eve of still greater scientific developments. *Iron and Steel Engineer*, [Official publication of the Association of Iron and Steel Electrical Engineers] says that in ten years the modern rolling mill of today will be rendered obsolete. It foresees the human element behind screens, servicing mechanisms that will obey the wave of the hand, the call of the voice. In view of recent electrical developments, this picture is by no means visionary. . . . The late Judge Gary, seated in his office at 71 Broadway, New York, merely by passing his hand over a glass sphere set in operation the gigantic electrified Homestead steel plant near Pittsburgh. A rolling mill is now being developed in which huge bars of steel are moved and controlled by throwing bars of light upon them. What marvels will the future unfold?—C. W. Steffner in *Commerce and Finance*.

Automobiles and Cooking Utensils Consume Most Aluminum

C. L. Mantel, in a chapter on aluminum in "Mineral Industry, 1928," says that more aluminum is consumed by the automobile industry than by any other. The year has brought a large increase in the use of aluminum pistons for automotive engines. It is estimated that in 1928 over 20,000,000 lb. of aluminum pistons, both as original equipment and as replacements, were produced. Other applications such as engine castings, forgings, connecting rods, and crank cases found wide use.

The second highest consumer of aluminum metal was the cooking-utensil and household-appliance manufacturing industry. The third largest was that of electrical conductors, including steel-reinforced high-tension transmission-line cable, as well as all-aluminum cable and bus bars. The jobbing foundries, serving a wide field of many different industries, were the fourth largest consumer. The steel industry, consuming a large tonnage of metal in the form of granulated aluminum ingot, grained ingot, notch bar and rod, stood fifth.

Certain special applications of aluminum have continued to show increasing tonnages. One of these is aluminum powder for paint purposes; another is aluminum foil, of which it is estimated that 6,000,000 lb. was employed in 1928 for wrapping yeast cakes, chocolates, candies, and chewing gum, in the manufacture of electrical and radio condensers, as well as other miscellaneous uses, including aluminum collapsible tubes.

Fatigue Tests on Drums and Shells

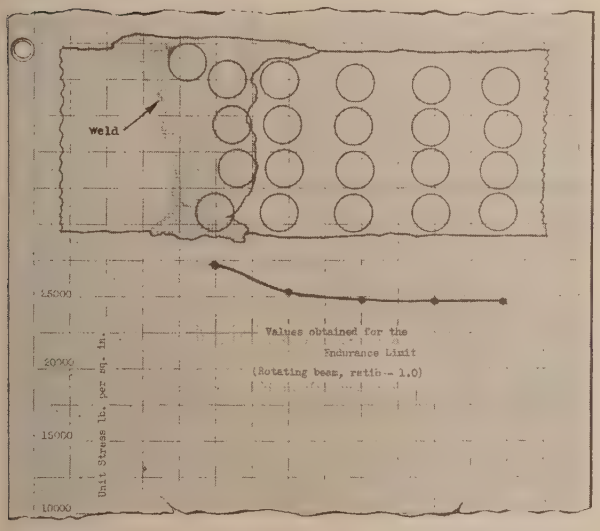
To the Editor: It is with considerable interest that we have read of the work of the Babcock & Wilcox Co. on full-size boiler drums reported by Prof. H. F. Moore in the Sept. 5 issue of THE IRON AGE. Tests of this kind are valuable in giving stability to the various methods of making boiler drums for service. Three points brought out by these tests which should not be overlooked are as follows:

1. The failure of a drum head.
2. The failure adjacent to the weld of a boiler welded with a bare wire.
3. The failure of the drums welded with covered wire and the forged drums due to a ½-in. tapped hole for pressure outlet.

Up to three years ago little thought had been given in this country to the question of design of vessels for pressure service. Although a considerable number of failures had been encountered, and some of them very serious, there seemed to be little energy exerted by boiler makers to go thoroughly into the question of the best materials for boilers, the question of the effect of shape and also the question of improved fabrication methods.

Three years ago the company which the writer represents went very thoroughly into these questions and demonstrated that boilers could be made of far superior quality to those then available and in use. On the subject of shape, for example, the seriousness was demonstrated of out of roundness, of the wrong shape of heads and of the lack of reinforcing of openings. Since that time we have reinforced all openings, our vessels have been made round and straight to a degree not before thought necessary, and all openings, even temperature measuring holes, and gage or pressure holes, have been religiously reinforced. The degree of reinforcing necessary to produce a design of 100 per cent, for the particular type of construction, has been discovered and applied to the particular method of fabrication used.

WELDED Pressure Vessel Withdrawn From Service on Account of Excessive Corrosion Burst By Static Pressure Test. Fracture occurred in corroded plate at approximately ultimate tensile test of plate as rolled



SPECIMENS Cut from Heavy Weld Made by Special Process Have Higher Endurance Limit Than Adjoining Boiler Plate

It has been demonstrated that today vessels can be made which will not fail other than in the steel of the plates and at stresses represented by the ultimate strength of the plate if tested statically and at stresses represented by the fatigue strength of the plates if tested under repeated stress.

As a supplement to the above statement the writer would like to present two illustrations. One represents the endurance limit of the steel in the weld and adjacent to the weld in a plate 2½ in. thick. It tells its own story. Fatigue specimens taken at right angles to that shown in the sketch, with the center of the specimen at the weld junction, and at other points, reproduce the indicated value.

The other is a photograph of a vessel which has been in service for 3½ years which was withdrawn and tested to failure. This vessel had been in a service in which corrosion plays a very important part. Its original thickness in the zone where the gas of the process was in contact with the metal was 2½ in. and had corroded to a thickness of 1.6 in. in the plate. (The welds had not corroded to the same degree.) This vessel failed under test pressure when the stress in the steel was 56,900 lb. per sq. in., which is the full strength of the steel before it was used. Failure avoided the welds completely.

One other point of importance should be hinted at and that is the question of the cleanness of steel. There is no question in the writer's mind that the cleanness of steel plays an important part in corrosion and also in fatigue. This is being recognized by the makers and users of boiler steel to a greater degree than ever before.

Iron and Steel Markets

Weakness Develops in Steel Prices

Bars and Shapes Down $1 a Ton and Wire Rods $2— Further Reductions in Scrap—Railroad Demand Looms Larger

EVIDENCES of price weakness have accumulated as steel production has declined. Railroad demand, the most favorable factor in the market, looms larger, but will not have an immediate effect on mill schedules. Much rail and rolling stock business is still prospective and even on orders actually placed it will take time for the specifications to reach steel producers.

Unquestionably the sentimental effect of expanding railroad needs is salutary and may stiffen the resistance of the mills to price pressure. At Chicago new inquiries for finished steel, including rails and track supplies, are the second largest for any week so far this year.

Rail orders include 50,000 tons for the St. Paul and 59,000 tons for the Chesapeake & Ohio, Pere Marquette and Hocking Valley. The Pennsylvania's inquiry, which is expected tomorrow, will probably call for a larger total than last year, when 272,000 tons was bought. The Chicago & North Western's needs, which will be made known Thursday, are estimated at 50,000 tons, while the requirements of the Santa Fe and New York Central are placed at 90,000 and 200,000 tons respectively.

Railroad freight equipment in the market or in early prospect totals close to 25,000 cars. The Burlington will buy 2000, and an inquiry for a like number is expected from the Virginian. The Pere Marquette and Illinois Central have been added to the list of probable purchasers.

Steel ingot production is now slightly under the 85 per cent average of 12 months ago and signs point to some further recession, in contrast with the rising trend of 1928. Operations in the Valleys, Pittsburgh and Chicago range from 80 to 85 per cent, while the Buffalo rate remains at 90 per cent.

Price developments, although not of a sweeping character, all point to a growing need for new business. Bars and shapes have declined $1 a ton to 1.90c., Pittsburgh. Wire nails, which recently receded to $2.45, Cleveland or Pittsburgh, lack firmness at that level, and mills are meeting increasing resistance in their efforts to hold plain wire at $2.40. Galvanized sheets have returned to 3.50c., Pittsburgh, after an unsuccessful effort to raise the market to 3.60c. Wire rods at Cleveland have been sold at $40, a concession of $2 a ton.

In the South black sheets have been reduced $2 a ton to 3c., Birmingham, and on the Pacific Coast the long standing price of 2.35c., c.i.f., on plates has been shaded $2 a ton on desirable specifications.

Scrap, in keeping with declining steel works operations, continues to weaken. In eastern Pennsylvania heavy melting steel has gone down 50c. a ton on purchases of 10,000 tons each by two steel producers. The same grade has receded 25c. a ton at Pittsburgh, Chicago and St. Louis.

Pig iron demand, although lacking the characteristics of a broad buying movement, has been consistent, indicating conservative coverage for known requirements. In some cases Southern iron, recently available at bargain prices, has been bought for deliveries extending well into the first quarter. Considerable iron is still to be purchased for the final three months of the year, however, and buyers are prone to delay purchases in territories where offerings of steel company iron are likely to increase.

The Ford Motor Co., which last week bought 5000 tons of high silicon malleable iron from a Canadian furnace, is in the market for 10,000 tons additional. Ford's purchases of pig iron in the open market are expected to increase, since the blast furnace capacity at River Rouge is inadequate. A large stock pile built up some years ago in preference to erecting a third stack has been reduced to the point where it no longer makes up for the deficiency in pig iron production.

The diminishing steel requirements of the automobile industry were reflected in the August report of independent sheet mills, which showed declines of 55,000 tons in sales and 87,000 tons in unfilled orders. Steel specifications from the motor car builders are still receding, but at least a temporary reversal of the trend is now looked for in October. Curtailment by Ford is attributed to slight changes in the present model.

Fabricated structural steel awards totaled 33,000 tons, compared with 50,000 tons last week. Fresh inquiries call for 32,000 tons.

Two ships to be built by the Sun Shipbuilding Co. call for 10,000 tons of plates, which will be supplied by the leading interest. Five towboats placed at Pittsburgh and 50 barges in the market there account for 7500 tons of steel.

The setting up of a local base price on cold-finished steel bars by a new Buffalo mill will force Pittsburgh makers to lower their quotations to meet competition in western New York and northern Pennsylvania.

For the second time this year THE IRON AGE composite price for finished steel has declined. At 2.384c. a lb., the year's low, it compares with 2.398c. last week and 2.412c. from April 1 into August. The pig iron composite is unchanged at $18.29 a ton.

Pittsburgh

Price Weakness Develops in Steel as Mills Seek Business More Aggressively—Bars and Shapes Off $1

PITTSBURGH, Sept. 24.—As the third quarter comes to a close it is interesting to compare the condition of the steel industry in the Pittsburgh district with its status one year ago. The average operating rate is about the same. There the similarity ends. A year ago the industry was entering a period of strong demand, which lasted with but one slight interruption for an entire year. The peak of this buying movement was reached last spring and gradual recession followed during the summer.

In view of the more rapid decline in business during September it is difficult to predict how much lower steel production must go. It does seem certain, however, that any marked improvement in demand during the fourth quarter would be almost too much to expect after the very striking performance of the past year. It would not be surprising if steel operations declined a bit further in the next month or two in order to bring about a better adjustment of production to demand.

In the Pittsburgh district operations now average about 85 per cent of capacity, while the rate in the Youngstown and Wheeling districts is somewhat lower. Sheet mills are still running at close to 90 per cent of capacity, but other finishing departments are at a lower rate, with strip mills probably at the bottom with about a 70 per cent rate. The latter have felt most sharply the decline in demand for automobile steel.

With the automobile industry no longer counted upon to provide the wide outlet for steel which it afforded in the first three quarters, the railroads seem to offer the brightest outlook for the last three months. The rail buying movement ordinarily expected at this time of the year is beginning and promises to be of slightly larger proportions than usual.

Car inquiries are large, and, although the bulk of this business may come from Western roads whose buying would not materially benefit the Pittsburgh district, Southern and Eastern carriers are also coming into the market. Car builders in this vicinity are now in need of orders.

The plate business in this district has been given impetus during the week by a prospective inquiry for 50 barges, which will require from 4000 to 5000 tons of steel and by the purchase of five tow-boats calling for a total of 2500 tons.

The price structure is finally showing definite weakness. Bars and shapes are off $1 a ton on the basis of open solicitation for bar business at 1.90c., Pittsburgh or Cleveland, while the Pittsburgh base on shapes has been forced down by competition in the East. Plates appear to be holding in this territory at 1.95c., Pittsburgh, apparently because most producers still have fairly large backlogs. Wire nails have declined $2 a ton, and the $2.45 price lacks firmness. Mills are meeting with resistance in holding the price of plain wire at 2.40c., although concessions have not appeared in this territory. Attempts to hold galvanized sheets at 3.60c., Pittsburgh, have not met with success, as several makers are taking fourth quarter business at 3.50c. Prices on the other finishes of sheets are not strong and large users of strip steel are delaying the placing of business. A good percentage of the

smaller buyers have closed on third and fourth quarter requirements at full quoted scales.

The scrap market continues to weaken as mill buying is further delayed. Heavy melting steel has declined 25c. a ton.

Pig Iron.—Sellers of pig iron in this district, who had anticipated the placing of rather heavy fourth quarter tonnages by large buyers, have now altered their opinion somewhat and are inclined to believe that buying is more likely to continue on the hand-to-mouth basis which has existed for several months. With spot shipments of small tonnages available from nearly all the merchant furnaces in the Pittsburgh and Valley districts, and with the promise of ample supplies of steel company iron in the next few weeks, buyers are willing to delay making commitments. The threat of steel company iron is growing more serious in this district as steel production has been curtailed rather sharply during September, while no blast furnaces have been blown out recently. The effect of this condition on the price structure has not yet been felt, and the full quoted schedules are said to apply on all current transactions. American Steel Foundries is inquiring for 5000 tons of basic iron for fourth quarter delivery at Alliance, Ohio. The Westinghouse Electric & Mfg. Co. is inquiring for the fourth quarter requirements of foundry iron for its Cleveland plant. The Richmond Radiator Co. is understood not to have closed as yet in full on the requirements of its Uniontown, Pa., plant. No other large general inquiries are before the trade, but a few large buyers of iron are said to be quietly negotiating for their fall requirements. Shipments have held up rather steadily during September, and furnace stocks are still low. No merchant interest in the Valley is prepared to furnish all grades of iron at this time, and one has enough business on its books to assure a steady operation for the remainder of the year. Prices appear to be holding at $18.50, Valley, for basic and foundry iron, and at $19 for Bessemer and malleable, while the local merchant interest is quoting prices 50c. a ton higher.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Non integrated companies are requiring less and less semi-finished steel as the month goes on, but the total curtailment during September could hardly be considered drastic. In the case of a few makers of strip steel and sheets, the falling off has been much more pronounced than in the manufacture of other products. Very little fourth quarter contracting has been reported, and the decline in shipments during the month will enable buyers to postpone negotiations still further. So far as can be learned, such business as has been placed has commanded the full $35, Pittsburgh or Youngstown, price on billets, slabs and sheet bars, and makers are firm in naming this price on fourth quarter contract business. On forging billets, the common quotation is $40, Pittsburgh, and the price is fairly well established. Shipments of wire rods are holding up fairly well.

Bars, Shapes and Plates.—Specifications continue very light on these products, although some makers report a slight improvement in the demand for bars. Operations are on a hand-to-mouth basis on bars and shapes, although some companies have a three to four weeks' backlog of plates. Prospects for fall business are not particularly good, but, on the other hand, large consuming industries have done nothing to indicate any decided falling off in their requirements. They are buying more closely and the total tonnage is somewhat reduced, but this does not necessarily mean that there will be any marked drop in the aggregate demand. Prospects for plate tonnage have been improved by the placing of five all-steel tow boats by the Standard Unit Navigation Co., three of which will be built by a Pittsburgh company. These boats will require approximately 2500 tons of plates. The Standard company is expected soon to inquire for 50 barges requiring between 4000 and 5000 tons of steel. Otherwise, barge business is rather quiet, but there is some work in prospect, and the official opening of the canalized Ohio River next month may give impetus to barge buying. Structural awards in this district are not heavy, and the backlogs of fabricating shops have been materially reduced in the last six weeks. Demand for reinforcing bars is steady and seasonally stronger, with no falling off expected before at least another month. Keener competition for business in bars and shapes has brought a recession of $1 a ton on these products, though some sellers are still holding for 1.95c. A Pittsburgh district maker of bars began the soliciting of business in the East at 1.90c., and this concession has been met by some other producers. Concessions on structural shapes have resulted almost entirely from competition with makers in the East. These concessions have been given for some weeks on Eastern business, but have now extended to some buyers in the Pittsburgh district.

Rails and Track Accessories.—The Pennsylvania Railroad is inquiring for its third quarter requirements of track accessories, but has not yet made known its annual rail requirements. Its accessory needs will be about the same as in previous years for this period. The Chesapeake & Ohio has not yet closed on the rails and tie plates inquired for earlier in the month. Definite rail inquiries are still lacking, although a number of roads are expected to make their requirements known in the immediate future.

Wire Products.—Shipments of manufacturers' wire in September will show little decline from those of

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	−11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	15
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	44	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

August, and present specifications are not far below recent levels. Fourth quarter contracts are being closed at 2.40c. to 2.50c. a lb., Pittsburgh, and efforts are being made to hold these prices in the face of further weakness in the nail market. Nail prices have settled to $2.45 a keg, Pittsburgh, on orders of fair size, and considerably lower prices have come out in competitive territory down the Ohio River. It is believed, however, that $2.45 a keg, Pittsburgh, represents the minimum in this immediate territory.

Tubular Goods.—Pipe mills in this district are continuing the recent high operating rate, and the average for the industry as a whole is certainly not below 75 per cent of capacity. Lap weld and seamless units are most active, and, although mill backlogs are not heavy, the prospect for fall business looks very good. Jobbers in this territory have maintained resale prices on pipe very satisfactorily, and Pittsburgh mills now have the assurance that shading in other districts will be discontinued. Shipments of mechanical tubing reflect the dullness in the automobile trade, and the September movement will fall considerably behind August.

Sheets.—Specifications continue to decline, largely because of the reduced requirements of the automobile industry. September shipments, however, are going to compare favorably with those of August, as most mills entered the month with fairly large backlogs, which have since been reduced considerably. One or two of the larger mills have enough business on their books to assure a fairly heavy operating rate during October, but a number of companies, principally makers of automobile body sheets are now operating on a hand-to-mouth basis. Mills are not actively soliciting fourth quarter contracts and few are being placed. The Ford Motor Co., which recently cut one day a week from its operating schedule, is taking a correspondingly smaller tonnage of sheets and is instructing its sources of supply to keep their shipments in close alinement with its production schedules. This is not interpreted by the trade as a sign of probable curtailment of operations, but rather indicates that the company contemplates slight model changes which will not seriously cut down output. The other large maker of low-priced cars is continuing to reduce its steel shipments, and it now seems certain that drastic model changes will be made which will eliminate the company as a large user of steel for the remainder of the year. A few makers of cars in the medium-priced field are very busy, but the industry as a whole is not now expected to increase its steel consumption to any noticeable extent before the end of the year. Other large consumers of sheets promise to keep up present requirements over the last quarter. Prices are holding fairly well, except in the case of galvanized material. At least four large makers are adhering to a 3.60c., Pittsburgh, minimum on fourth quarter business, but others are taking contracts at 3.50c., and it now seems that efforts to establish the market at a higher level are to be of no avail.

Tin Plate.—Operations have shown no decline in the last week and one independent producer is running at a slightly higher rate. The leading interest is still operating at about 90 per cent of capacity and the average for the district is certainly not more than 10 points under this rate. Business is strictly of a hand-to-mouth nature, with specifications one week deciding the operating rate of the next. Next month, however, sufficient 1930 commitments will have come to some makers to allow them to begin rolling such tonnage.

Strip Steel.—Specifications are still very light, and the industry as a whole is not operating at higher than 70 per cent of capacity. The automobile industry is responsible for this slackening, as other users of strip have not curtailed their requirements and demand from these sources is well diversified. A few fourth quarter contracts of size have been closed, but larger users are hesitant in their commitments, largely because their requirements are rather uncertain. Prices are fairly stable and makers in this district have had no difficulty in obtaining 1.90c. and 2c., Pittsburgh, on hot-rolled material. On cold-rolled, 2.75c., Pittsburgh or Cleveland, seems to be the minimum; on small tonnages a $2 premium is sometimes paid.

Cold-Finished Steel Bars.—The new maker of cold-finished bars at Buffalo has established a Buffalo base price of 2.30c. a lb., and will have a distinct advantage over Pittsburgh mills in western New York and northern Pennsylvania. Local makers whose base price is the same, will meet this competition at most points. In New York City and New England the difference in freight rate amounts only to a few cents a 100 lb. Specifications this month have run slightly under those of August, and no upward tendency in demand is reported. Fourth quarter contracts are being taken at 2.30c., Pittsburgh, and the new extras announced last summer will apply on all fourth quarter shipments.

Coke.—The leading steel company interest in the Connellsville region plans to put out a large number of ovens in that district in the near future. Heretofore, curtailment of production has resulted in a stronger price situation, but definite signs of lower blast furnace requirements during the fall are certain to have an unfavorable influence. However, one large steel company in the Valleys, which ordinarily makes sufficient coke for its own use, has contracted for a large monthly tonnage during the fourth quarter. Furnace coke is still quotable at $2.65 to $2.75 a net ton, Connellsville.

Old Material.—It has now been about six weeks since dealers in this district have received any substantial orders for scrap, and, in the face of protracted hold-ups at many points and a constantly increasing supply of material, prices have held fairly well. No. 1 heavy melting steel has declined 25c. a ton, and is now quotable at $17.50 to $18.50. The lower figure represents dealers' buying prices, while the wide spread is necessary to include small sales during the week at $18 to $18.50. Hydraulic compressed sheets are also lower on the strength of purchases by dealers at $17.50 and less, this grade now being quotable at $17.50 to $18. The supply of compressed sheets in the district is not large, but no sizable sales have been made for several weeks, and one consumer has held up shipments at both its mills. Specialties are also weaker, and declines have been registered in other groups.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.

Ferrochromium, 4 to 6% carbon and up, 65 to 70% Cr., per lb. contained Cr. delivered, in carloads	11.00c.
Ferrovanadium, per lb. contained vanadium, f.o.b. furnace	$3.15 to $3.65
Ferrocarbontitanium, 15 to 18%, per net ton, f.o.b. furnace, in carloads	$160.00
Ferrophosphorus, electric or blast furnace material, in carloads, 18%, Rockdale, Tenn., base, per gross ton	$91.00
Ferrophosphorus, electric 24%, f.o.b. Anniston, Ala., per gross ton	$122.50

Fluxes and Refractories

Fluorspar

	Per Net Ton
Domestic, 85% and over calcium fluoride, not over 5% silicon, gravel, f.o.b. Illinois and Kentucky mines	$18.00
No. 2 lump, Illinois and Kentucky mines	20.00
Foreign, 85% calcium fluoride, not over 5% silica, c.i.f. Atlantic port, duty paid	$18.25 to $18.75
Domestic, No. 1 ground bulk, 95 to 98% calcium fluoride, not over 2½% silica, f.o.b. Illinois and Kentucky mines	32.50

Fire Clay Brick

	Per 1000 f.o.b. Works: High-Heat Duty Brick	Intermediate Heavy Duty Brick
Pennsylvania	$43.00 to $46.00	$35.00 to $38.00
Maryland	43.00 to 46.00	35.00 to 38.00
New Jersey	50.00 to 65.00	.....
Ohio	43.00 to 46.00	35.00 to 38.00
Kentucky	43.00 to 46.00	35.00 to 38.00
Missouri	43.00 to 46.00	35.00 to 38.00
Illinois	43.00 to 46.00	35.00 to 38.00
Ground fire clay, per ton	7.00	

Silica Brick

	Per 1000 f.o.b. Works
Pennsylvania	$43.00
Chicago	52.00
Birmingham	50.00
Silica clay, per ton	$8.50 to 10.00

Magnesite Brick

	Per Net Ton
Standard sizes, f.o.b. Baltimore and Chester, Pa.	$65.00
Grain magnesite, f.o.b. Baltimore and Chester, Pa.	40.00
Standard size	45.00

Chrome Brick

	Per Net Ton
Standard size	$45.00

Mill Prices of Bolts, Nuts, Rivets and Set Screws

Bolts and Nuts

Per 100 Pieces

(F.o.b. Pittsburgh, Cleveland, Birmingham or Chicago)

	Per Cent Off List
†Machine bolts	70
†Carriage bolts	70
Lag bolts	70
Plow bolts, Nos. 1, 2, 3 and 7 heads	70
Hot-pressed nuts, blank or tapped, square	70
Hot-pressed nuts, blank or tapped, hexagons	70
C.p.c. and t. square or hex. nuts, blank or tapped	70
Washers*	7.00c. to 6.75c. per lb. off list

*F.o.b. Chicago, New York and Pittsburgh.

†Bolts with rolled thread up to and including ⅛ in. x 6 in. take 10 per cent lower list prices.

Bolts and Nuts

	Per Cent Off List
Semi-finished hexagons nuts	70
Semi-finished hexagons castellated nuts, S.A.E.	70
Stove bolts in packages, P'gh	75, 20, 10 and 5
Stove bolts in packages, Chicago	75, 20, 10 and 5
Stove bolts in packages, Cleveland	75, 20, 10 and 5
Stove bolts in bulk, P'gh	75, 20, 10, 5 and 2½
Stove bolts in bulk, Chicago	75, 20, 10, 5 and 2½
Stove bolts in bulk, Cleveland	75, 20, 10, 5 and 2½
Tire bolts	60, 5 and 5

Discounts of 70 per cent off on bolts and nuts applied on carload business. For less than carload orders discounts of 55, 60 per cent apply.

Large Rivets

(½-In. and Larger)

	Base per 100 Lb.
F.o.b. Pittsburgh or Cleveland	$3.10
F.o.b. Chicago	3.20

Small Rivets

(7/16-In. and Smaller)

	Per Cent Off List
F.o.b. Pittsburgh	70 and 10
F.o.b. Cleveland	70 and 10
F.o.b. Chicago	70 and 10

Cap and Set Screws

(Freight allowed up to but not exceeding 50c. per 100 lb. on lots of 200 lb. or more)

	Per Cent Off List
Milled cap screws	80, 10 and 5
Milled standard set screws, case hardened	80 and 5
Milled headless set screws, cut thread	75 and 10
Upset hex. head cap screws, U.S.S. thread	85
Upset hex. cap screws, S.A.E. thread	85
Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Steel Orders in Prospect Make Large Total—Current Business Moderately Improved—Railroads Center of Interest

CHICAGO, Sept. 24.—Consumers' interest in forward needs of steel products is indicated in the number and size of inquiries rather than in actual purchases. Including a liberal tonnage of rails and track supplies, inquiries this week make one of the largest totals so far this year. Specifications, like new business, show improvement over those of the previous week, but the gain here is not so impressive as in prospective business.

The leading producer is still holding two blast furnaces banked. Steel mill output is being closely gaged to actual requirements and no evidence is at hand to indicate accumulations either of pig iron or of semi-finished steel.

All producers of plates, shapes and bars are meeting on common ground in the matter of prices, which have been named at 2.05c. a lb., Chicago, for delivery in the coming three months.

Interest is increasing locally in the railroad equipment and rail markets. The Burlington budget, which provides for the purchase of not less than 2000 cars, has been approved, and several other Western railroads are rapidly rounding out car buying programs.

The St. Paul has placed 50,000 tons of rails with two Chicago mills, and rail inquiry which will come into the market shortly is imposing. Preliminary estimates made here place the Santa Fe inquiry at 90,000 tons and that of the New York Central at 200,000 tons. Western rail mills are now assured of continuous operations throughout the remainder of the year. The Colorado Fuel & Iron Co. is said to have started its rail mill on a double turn basis.

The structural market, though quiet at the moment, seems to have an undercurrent of strength as a result of greater activity among architects and engineers. Efforts are being made to lift prices for reinforcing bars. Moves of this kind usually result in sizable awards just prior to the time that old prices are withdrawn.

Pig Iron.—Northern iron remains firm at $20 a ton, local furnace, on contracts for the fourth quarter. Five merchant furnaces are in blast and shipments are fully equal to output. Needs for the next three months, and in some cases also the first month in the new year, are being covered at a steady rate. Scattered and small sales of silvery are reported at prices which indicate lack of stability. Shipments of this commodity are at a high rate. Close to 1000 tons of Southern iron has been sold in this district in the last week. Prices ranged from $13 to $13.50 a ton, Birmingham. The charcoal iron market is steady from the viewpoint of shipments.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Several spot carloads of 50 per cent ferrosilicon are before the trade. This commodity is being quoted in small lots at $88.50 a ton, delivered. Two car lots of spiegeleisen have been taken by consumers at $34 a ton, Hazard, Pa. On the whole, this market is more active in small purchases, many of which are fill-in tonnages to meet extra requirements in the last quarter.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Sheets.—New buying except for immediate needs is sluggish, and prices are no more settled than a week ago. Consumption in this district is at a high rate and output is supported at 90 per cent of capacity. Shipments and new releases for heavy gage blue annealed sheets still run high and deliveries from local mills cannot be counted on before late in November. Other grades may be had in three to four weeks. The roofing trade is still drawing heavily against commitments, while, on the other hand, manufacturers of lockers and shelving are experiencing a lull in orders and are taking smaller quantities of sheets from mills. Builders of light tanks are finding outlets for their products, and jobbers continue to distribute sheets in liberal quantities over a wide territory. Taken as a whole, this market is in a satisfactory state except as to prices. The aggregate of incoming business is fully equal to shipments.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Rails and Track Supplies.—The Chicago, Milwaukee, St. Paul & Pacific has ordered 50,000 tons of standard-section rails, of which 40,000 tons was taken by the Illinois Steel Co. and 10,000 tons by the Inland Steel Co. The distribution of the Union Pacific Rails, purchase of which was announced last week, was 21,000 tons each to the Illinois Steel Co. and the Colorado Fuel & Iron Co. and 6000 tons to the Inland Steel Co. Neither of these railroads has definitely entered the market for track fastenings, the aggregate of which will be close to 25,000. The Pennsylvania is taking bids on 8000 kegs of spikes and the Chesapeake & Ohio will buy 10,000 tons of tie plates. Sellers here estimate that the New York Central's rail needs will be about 200,000 tons and that the Santa Fe will take not less than 90,000 tons. Although no actual specifications for rails have been received against recent orders, it is generally understood that releases will reach mills in time for rolling about the first week in October. As gaged by rolling schedules now in force, there seems little reason to believe that the current rate of output at 75 per cent capacity will drop. In fact, it seems entirely probable that this rate will be fully sustained until November, when heavier output is expected. Orders this week for track accessories represent only the ordinary run of tonnage for immediate use. An ordinance now being drawn in Chicago will authorize a larger expansion in surface line and elevated trackage.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Activity in this market is not growing except that contractors are taking deliveries faster in an effort to complete work at hand before cold weather. Buyers, both private and public, are showing little interest. Several sizable municipal inquiries, which the trade had expected to receive this fall, may be held over until spring. Milwaukee will close bids this week on 500 tons of 8 and 12-in. pipe. Holland, Mich., will soon buy 400 tons of 16-in. pipe. Other inquiries now before the trade are 200 tons of 2 to 8-in. pipe for Bridgeman, Mich.; 200 tons of 4 to 8-in. pipe for Carmel, Ind., and 100 tons of 2 to 6-in. pipe for Kempton, Ill. Prices for cast iron pipe are well stabilized, and deliveries on most sizes are prompt.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Plates.—Orders for tank plates, at 600 tons, are the smallest in several weeks. Inquiries, on the other hand, are impressive at 3500 tons, 1000 tons of which will be exported to South America after fabrication in a Chicago shop. Tank programs now before the trade call for not less than 20,000 tons of plates. The railroad car market remains active, with a fresh inquiry near at hand for 2000 cars for the Burlington.

Structural Material.—Numerous railroad inquiries, though small in the aggregate, are holding the center of interest in a market that otherwise is unusually quiet. On the brighter side of the structural market is the fact that architects are busy and the list of projects is constantly growing. An order has been placed at Milwaukee for 1350 tons, and a Chicago steel mill has ordered 1000 tons for a sintering

plant. The 42-story Northwestern Life Insurance Building at Milwaukee is again an active project.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Bars.—Some improvement is noticed in sales and specifications for mild steel bars. All producers are now naming two 2.05c. a lb., Chicago, as the fourth quarter price. Inquiry for immediate and future needs is brisk and forecasts a substantial buying movement at an early date. Deliveries average close to 30 days. Both inquiry and new buying in rail steel bars are light. Specifications, however, are above production and deliveries are lengthening.

Bolts, Nuts and Rivets.—Specifications for these commodities are measurably heavier, and release schedules indicate further growth near the end of the month. Western manufacturers of automobiles and farm implements are taking larger quantities. Jobbers are finding business more brisk and turnover of stocks is faster. Fourth quarter contracting is nearing completion. Prices remain steady.

Old Material.—Heavy melting steel, after having been purchased by consumers last week at $15.50 a gross ton, delivered, dropped 25c. a ton on consumers' orders. About 20,000 tons changed hands in the week. Demand for hydraulic bundles continues dull, and this grade is accumulating in the hands of producers as brokers are forced to hold back orders. A sizable sale of cast iron borings is reported at $11 a gross ton, delivered. Lower prices for scrap are confined almost wholly to the heavy tonnage grades. Consumption of specialties is larger, and supplies of most grades are not always available on the short notice given by users. Supplies of rerolling rails are more than ample for current needs, and prices have receded 25c. a ton to $18 a gross ton, delivered. Large consumers of scrap are bent on rounding out reserves, as shown by the fact brokers generally report that September shipments of most grades of scrap are close to the average rate in August despite reduced steel operations this month. General Motors Corporation is offering 16 cars of cast iron borings from its Muncie, Ind., plant. The St. Paul will sell 5000 tons of railroad scrap, and the Burlington is offering 2500 tons.

Prices deliv'd Chicago district consumers:

	Per Gross Ton	
Basic Open-Hearth Grades:		
Heavy melting steel	$15.00 to	$15.25
Shoveling steel	14.75 to	15.25
Frogs, switches and guards, cut apart, and misc. rails	16.25 to	16.75
Hydraul. compressed sheets	13.25 to	13.75
Drop forge flashings	10.75 to	11.25
No. 1 busheling	12.75 to	13.25
Forg'd cast and r'l'd steel carwheels	18.75 to	19.25
Railroad tires, charg. box size	18.75 to	19.25
Railroad leaf springs cut apart	18.75 to	19.25
Acid Open-Hearth Grades:		
Steel couplers and knuckles	17.00 to	17.50
Coil springs	19.00 to	19.50
Electric Furnace Grades:		
Axle turnings	14.25 to	14.75
Low phos. punchings	17.00 to	17.50
Low phos. plates, 12 in. and under	17.00 to	17.50
Blast Furnace Grades:		
Axle turnings	12.00 to	12.50
Cast iron borings	10.50 to	11.00
Short shoveling turnings	10.50 to	11.00
Machine shop turnings	7.50 to	8.00
Rolling Mill Grades:		
Iron rails	16.00 to	16.50
Rerolling rails	17.50 to	18.00
Cupola Grades:		
Steel rails less than 3 ft.	17.50 to	18.50
Steel rails less than 2 ft.	20.00 to	20.50
Angle bars, steel	17.00 to	17.50
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Railroad	17.00 to	17.50
Agricultural	15.50 to	16.00
Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heav.	26.00 to	31.00
	Per Net Ton	
Rolling Mill Grades:		
Iron angle and splice bars	15.00 to	15.50
Iron arch bars and transoms	21.00 to	21.50
Iron car axles	26.00 to	26.50
Steel car axles	17.50 to	18.00
No. 1 railroad wrought	14.00 to	14.50
No. 2 railroad wrought	13.25 to	13.75
No. 1 busheling	9.00 to	9.50
No. 2 busheling	7.00 to	7.50
Locomotive tires, smooth	14.50 to	15.00
Pipes and flues	10.00 to	10.50
Cupola Grades:		
No. 1 machinery cast	14.50 to	15.00
No. 1 railroad cast	14.00 to	14.50
No. 1 agricultural cast	13.25 to	13.75
Stove plates	12.25 to	12.75
Grate bars	11.75 to	12.25
Brake shoes	11.50 to	12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Reinforcing Bars.— Producers of rail steel reinforcing bars are naming 2c. a lb., mill, as the minimum price for roadwork steel and 2.10c. a lb. for bridge reinforcing steel. The trucking charge from the mills to Chicago is $3 a ton. New business is lighter than a week ago and the volume of fresh inquiries lends no support to the hope of larger sales as the fall season advances. Two Government hospitals, one at North Chicago and the other at Maywood, Ill., account for 400 tons of new business. Quotations on billet steel reinforcing bars remain weak, the range being 2.10c. to 2.35c. a lb. out of Chicago warehouse.

Cold-Rolled Strips. — This week brings a further slight decline in specifications for cold-rolled strips. New buying, both for immediate needs and for the fourth quarter, is dragging. Backlogs continue to grow lighter, and mills are being forced to make schedules on a hand-to-mouth basis. Further reduction in output is reported by makers of low-priced automobiles. Several automobile plants are now getting under way with new models, but their requirements are not sufficiently large to offset the drop in the industry as a whole.

Wire Products.—Spring terms, now open in the South on woven wire fencing, have failed to stimulate business except to a moderate degree. Demand for fencing over the country as a whole is in good volume, so that shipments in the first three weeks in September may be said to be satisfactory for this time of the year. Specifications from the manufacturing trade are a trifle lighter; otherwise this phase of the wire market is featureless. Fourth quarter buying by all classes of users is sluggish, and the fall trade is slow in getting under way. It is thought by some that drought in the Central Western States accounts for lack of interest by buyers. Specifications from jobbers are being received at mills at a fair rate. Shipments of nails are light and prices remain unstable. Demand for wire products in the third quarter has been only fair in comparison with the first two quarters of the year. The slower pace of the automotive industry is largely accountable for the falling off in demand in the last three months.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.10c. to 2.35c.
Reinforc'g bars, rail steel	1.85c. to 1.95c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands (¼ in. in Nos. 10 and 12 gages)	3.20c.
Hoops (No. 14 gage and lighter)	3.75c.
Black sheets (No. 24)	4.05c.
Galv. sheets (No. 24)	4.90c.

Cement c't'd nails, base per keg	3.20

Low Tonnage of Malleable Castings Made

WASHINGTON, Sept. 24.—Orders for malleable castings in August totaled 61,982 net tons, against 61,401 tons in July, according to reports received from the principal manufacturers by the Department of Commerce. Production was 68,651 tons, or 70 per cent of the reporting capacity of 98,073 tons, against 70,625 tons, or 73.5 per cent of the reporting capacity of 96,089 tons in July. August shipments were 69,240 tons, against 69,665 tons in July.

For the first eight months of the current year orders aggregated 587,872 tons, against 511,101 tons for the corresponding period of last year. Production was 607,392 tons, or 79.1 per cent of capacity, against 523,770 tons, or 68 per cent of capacity. Shipments were 602,203 tons, compared with 512,274 tons.

Production and shipments in August were the lowest for any month this year; orders, the lowest except for July. In August, 1928, production was 68,606 tons, shipments were 66,962 tons and orders booked totaled 66,128 tons.

New York

Southern Pig Iron Sold for Delivery in First Quarter—Railroad Equipment Outlook More Promising

NEW YORK, Sept. 24.—The pig iron market still lacks the characteristics of a broad buying movement, but active canvassing on the part of sellers continues to result in substantial bookings. It is also becoming evident that considerable quiet buying has been going on, in some cases for deliveries reaching well into the first quarter. Purchases for such extended shipment have been largely confined to Alabama iron, which astute buyers have regarded as a bargain at recent low prices. It is now estimated that more than 150,000 tons of Southern iron has been sold in the New York, Philadelphia and New England markets since mid-year, when Alabama furnaces became aggressive in their campaign for Northern business. The large stocks of unsold iron on Alabama furnace yards, which at that time totaled nearly 500,000 tons, have been reduced and merchant iron production in the South has been cut down by the recent blowing out of two furnaces. Prices on Alabama foundry iron are stiffening. The general quotation is now $13.50, base furnace, with $13 occasionally named on attractive tonnages. It is conceded, however, that there may still be some outstanding quotations as low as $12.50. Sales in this district during the week totaled 20,000 tons, of which more than one-half was Southern iron. Northern prices are still flexible. For delivery in this territory, eastern Pennsylvania foundry iron is still available at $18.50, base furnace, while Buffalo iron is quoted at $17.50 to $18, base furnace. Buffalo producers have had a little more leeway in making delivered prices as a result of a decline in barge rates from Buffalo. As against a former rate of $2 a ton to New York harbor, $1.50 is now generally available and $1.25 has been done in at least one instance. The Foran Foundry & Mfg. Co., Flemington, N. J., has closed for 1000 tons of No. 2 plain and No. 2X Northern iron for fourth quarter delivery. Operations of jobbing plants are increasingly spotty, but foundries affiliated with manufacturing plants are melting iron at an unchanged rate. In fact, September deliveries of iron by one important seller are running larger than those for August, which was a leading month of the year in point of shipments.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	19.89 to 21.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.39 to 21.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Buying has improved in the past week, especially in galvanized sheets and structural steel. Orders for structural material are individually larger and prices quoted by jobbers are firmer than for some months. Quotations on galvanized sheets are still subject to some shading.

Cast Iron Pipe. — Quotations on pressure pipe are still irregular. Northern foundries are well filled with tonnage on the larger sizes, but are seeking orders for small diameter pipe. Ossining, N. Y., is about to close a contract involving about 250 tons of water pipe. Westfield, N. J., opens bids Oct. 10, on a contract requiring about 300 tons of 36-in. water pipe. Baltimore opened bids Sept. 25 on 53,500 ft. of 4 to 20-in. pipe and 396 tons of fittings.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Finished Steel.—Such change as there has been in the volume of steel business in the past week has been toward improvement, but the gain has been slight. Most of the steel buyers in this territory have renewed or extended contracts to cover the fourth quarter. In the price situation there is nothing new except for a more general abandonment of efforts to obtain 3.60c., Pittsburgh, for galvanized sheets. The fact that some fourth quarter contracts were entered at 3.50c., together with the offering of such sheets for prompt shipment at this price, has discouraged efforts of other mills to get $2 a ton higher. Wire nails are being sold at $2.45 to $2.55 a keg. Nearly all pipe makers have now notified local distributers of their intention to insist on the maintenance of resale prices for out-of-stock material. Railroad equipment companies are encouraged by the prospect of increased buying of cars this fall. The Southern Railway, which inquired for 2000 cars, may buy as many as 5000. The Virginian Railway is expected to come into the market shortly for 2000 cars. The largest structural steel letting of the week was 6000 tons for a hotel on West Fifty-ninth Street, New York, awarded to A. E. Norton, Inc.

The New York Central and New York, New Haven & Hartford railroads have asked for prices on their fourth quarter steel requirements. Bids are to be in by Sept. 30 for both roads.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Ferroalloys. — An inquiry by the Ford Motor Co. for 800 tons of ferromanganese for fourth quarter delivery has appeared. Otherwise sales and inquiries are limited to carload and small lots. In spiegeleisen there have been frequent sales of small lots for early delivery, some of it being the imported product. One importer states that his receipts so far this year have amounted to about 3000 tons and it is interesting to note that about 2000 tons of this was delivered by water shipment in the Chicago territory. Prices as published on other pages continue unchanged.

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.30c.
Soft steel bars, small shapes	3.25c.
Iron bars	3.24c.
Iron bars, Swed. charcoal	7.00c. to 7.25c.

Reinforcing Bars.—Important awards and inquiries are scarce. However, mills are booking a fair amount of work requiring small tonnages. Despite the dullness of the market, prices are holding.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Coke.—Demand for heating coke has improved. One contract has been closed in this district for about 65,000 tons. Furnace coke continues quiet at $2.65 to $2.75 per net ton, Connellsville. Special brands of beehive foundry coke are $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—No. 1 heavy melting steel is moderately active, with brokers paying $16 a ton, delivered eastern Pennsylvania. A Coatesville, Pa., consumer is reported to have closed for upward of 10,000 tons of No. 1 heavy melting steel at $16.50, delivered. Most grades of scrap are rather inactive. Heavy breakable cast is quoted at $14 a ton by brokers filling contracts at $14.50 a ton, delivered. A recent purchase of heavy breakable cast was by a consumer at Florence, N. J.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.50 to $13.25
Heavy melting steel (yard)	8.00 to 10.00
No. 1 hvy. breakable cast.	10.25 to 11.00
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.75 to 8.00
Short shoveling turnings..	8.00 to 8.50
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles.....	19.50 to 20.00
Iron car axles.....	23.00 to 24.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.25 to 13.75
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$16.50
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	14.50
No. 2 cast (radiators, cast boilers, etc.)	14.00

Pig Iron.—Sales gained somewhat the past week, during which Cleveland interests entered orders for 32,000 tons of foundry and malleable iron for last quarter delivery. This business was well distributed as to districts and industries. Consumers have not yet shown interest in first quarter contracts. No price change for that delivery is expected. Shipments for September probably will show a slight increase over those of August, as producers, with one exception, have shipped a little more iron so far this month than during the corresponding period of August. The market is firm at recent prices. Cleveland furnaces quote foundry and malleable iron at $18.50, furnace, for outside shipment and at $19, for local delivery. Both grades are quoted at $20, furnace, for Michigan delivery. The M. A. Hanna Co., announces that its status as a producer of merchant pig iron will in no way be affected by the merger of its five Buffalo furnaces and two Detroit furnaces in the holding company that will also include the Weirton Steel Co.. and the Great Lakes Steel Corporation.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$19.50 to 20.00
Malleable	19.50
Ohio silvery, 8 per cent...	23.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Cleveland

September Steel Orders Fall Below Those of August—Wire Rods Decline $2 a Ton

CLEVELAND, Sept. 24.—The automotive industry is slow in getting back in production, and this is reflected in a decreased demand for steel. The seasonal slowing down of motor car manufacturing came later in the summer than was expected, and the revival is being deferred longer than looked for. While there is still a great deal of uncertainty as to the amount of activity the automotive industry will regain during the closing months of the year, it is generally expected that there will be much improvement in the demand for steel from this source during October.

Mills are getting a fair volume of miscellaneous orders, mostly from consumers outside of the automotive field. However, the September volume will run somewhat below that of August. Automobile manufacturers are making commitments rather sparingly for early requirements.

The slowing down of the Ford Motor Co. is attributed to some changes that will be made in the present model designs. The Chevrolet Motor Co., which is gradually curtailing operation, will also make changes in models. This company is now placing contracts with jobbing plants for stamped parts for new models, but it is stated that sheets for Chevrolet bodies will not be bought until some time in October. Mills having orders for steel for the present Chevrolet models have been instructed to complete shipments on old contracts by Oct. 8.

There has been considerable curtailment of operations by sheet and strip mills in this territory.

The attempted reestablishment of $42 on wire rods has been made uncertain by concessions to $40 for the last quarter. Prices on hot-rolled strip for the fourth quarter are still uncertain. While the present prices of 1.90c. for wide strip and 2c. for narrow material have been reaffirmed for that delivery, mills are encountering strong price resistance from the automotive industry and from makers of cold-rolled strip. It is rather strongly suggested that some of the mills needing business made concessions recently to cold-rolled strip mills and that the latter are now resisting the restoration of the regular quotations.

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes.....	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars.....	2.25c. to 2.50c.

Com. wire nails, base per keg.....	2.90

*Net base, including boxing and cutting to length.

Iron Ore.—With record-breaking shipments of Lake Superior ore this year, furnaces have been able to build up their furnace stocks somewhat. The amount of Lake Superior ore at furnaces and Lake Erie docks Sept. 1 was 33,830,946 gross tons, compared with 31,754,179 tons on the same date a year ago. Furnaces consumed 5,779,-137 tons of Lake ore during August, a decrease of 29,336 tons as compared with July. The amount used in August, last year, was 4,760,974 tons. Furnace stocks Sept. 1 were 28,720,-430 tons. Furnaces in the Central district during August consumed 2,912,-944 tons, an increase of 11,712 tons for the month. Lake front furnaces used 2,580,074 tons, a decrease of 5337 tons. Eastern furnaces melted 125,-221 tons, a decrease of 26,227 tons, and all-rail furnaces used 160,898 tons, a decrease of 9484 tons. There were 192 furnaces in blast using Lake ore Aug. 31, a decrease of four for the month.

Rails.—Orders for 59,000 tons of rails, of which 53,500 tons are for the Chesapeake & Ohio and Pere Marquette and 5500 tons for the Hocking Valley Railroad are being placed here today. The distribution of this tonnage will be concluded tomorrow.

Bars, Plates and Shapes.—A moderate amount of business has been taken for the fourth quarter, mostly by the extension of third quarter contracts with added tonnages. Mills are getting a fair volume of specifications from various consuming in-

dustries, although the demand for steel bars is almost wholly outside the automotive field. Fairly prompt deliveries can be made on steel bars. Cleveland mill competition is an important factor in eastern Michigan. Plates continue in fair demand for small lots. There is a fair amount of activity in the structural field. In Cleveland, 960 tons has been placed for the County Courts-Jail Building. In Detroit, the Grand Trunk Railroad will require 2000 tons for grade crossing elimination work. The project of this road for electrification and the building of an elevated automobile roadway above the tracks from Detroit to Pontiac, 25 miles, if carried out, will require 40,000 tons of structural steel.

Semi-Finished Steel.—Weakness has developed in wire rods, sales of which have been made at $40, Cleveland, for the fourth quarter, or a concession of $2 a ton from the current price, although the lower price has not been formally named for the quarter. Before the development of this weakness, some of the mills announced the reestablishment of the $42 price. The reduction is a reflection of the prices prevailing on wire, which are lower than at the start of the current quarter. The leading local producer, which recently opened its books for the fourth quarter at the current price of $35, Cleveland and Youngstown, for sheet bars, billets and slabs, closed contracts during the week with a number of consumers and expects to enter contracts with the remainder of its customers during the present week. Specifications, while fair, are not up to recent volume.

Sheets.—Orders from the automotive industry, which have been light for some time, show no improvement. The volume of business has further tapered off, and there was a reduction also in production during the week. Common black sheets are still in good demand and most mills have fair backlogs of that grade. Nearly all producers need orders for automobile body sheets. Some specifications for this grade have been issued for November and December shipment. Weakness has again developed in galvanized sheets, with quotations of 3.50c., Pittsburgh, and there are reports of shading to 2.75c. on black sheets.

Wire Products.—Demand for wire has slowed down and nails are dull. One producer, which has been asking 2.50c. for wire for Cleveland delivery, has reduced its price to 2.40c. While there is still a spread from 2.40c. to 2.50c., the lower price is more common. On nails, apparently little effort is being made to get above $2.45 per keg.

Cold-Finished Steel Bars.—Most consumers have covered for the fourth quarter at 2.35c., Cleveland, but mills are getting few specifications owing to the reduced demand for screw machine products from the automotive industry. Orders are as numerous as recently, but they are for smaller lots, and, while the aggregate volume will fall somewhat below that of August, business is regarded as fair.

Strip Steel.—Demand for both hot and cold strip is still rather light, as the automotive industry is not specifying any more liberally than it has been during the past few weeks. A moderate amount of contracting has been done for the fourth quarter. Hot-rolled strip appears firm at 1.90c. Pittsburgh, for wide material and 2c. for narrow in spite of pressure by some buyers to secure concessions. Contracts for cold-rolled strip have been closed at 2.75c., Cleveland and Pittsburgh. Efforts of mills to get 2.85c. for small lots have not met with much success. Hot-rolled strip mills have their backlogs well cleaned up and need orders, particularly for wide material. Production of cold-rolled strip has been curtailed by some of the mills for lack of orders, and others are running from hand to mouth.

Bolts, Nuts and Rivets.—Makers of these products have closed contracts for the fourth quarter with many of their customers at present prices, which were reaffirmed for that delivery. Bolt and nut specifications are still rather light. The industry is operating at about 70 per cent of capacity. Rivet orders have improved since the first of the month.

Coke.—Ohio by-product furnace coke has been reestablished at $8 25, Painesville, for October shipment. The demand is moderate. Connellsville foundry coke is quiet and prices are unchanged. Producers have booked a good volume of early fall business in by-product coke for domestic use and there is a lull in the market at present.

Old Material.—A Cleveland mill has purchased a small tonnage of No. 1 railroad heavy melting steel at $16.90 but otherwise business was confined to transactions between dealers. Locally, the market has shown fewer indications of weakness than in the surrounding districts. Dealers continue to pay up to $15.50 for the light grades of heavy melting steel used by one Cleveland mill. Blast furnace scrap is bringing $11.25 to $11.50 from dealers. A slight spurt in the demand has resulted in a 25c. a ton advance on machine shop turnings and short shoveling turnings. For delivery in the Youngstown district, No. 1 heavy melting steel is bringing $17.75 from dealers and compressed sheet steel $17.50.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.25 to $15.50
No. 2 heavy melting steel	14.75 to 15.00
Compressed sheet steel	15.50 to 16.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	10.00 to 10.50
Short shoveling turnings	11.50 to 12.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.25 to 10.50
Mixed borings and short turnings	10.25 to 10.50
No. 2 busheling	10.25 to 10.50
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.00
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Two Mills Buy Heavy Melting Scrap—Third of Chesapeake & Ohio Rails to Eastern Producer

PHILADELPHIA, Sept. 24.—Operating rates of eastern Pennsylvania steel mills are at 90 per cent or less, with new orders still limited in number and tonnage. Demand for structural steel is active and shape mills are fairly well engaged, at the same time quoting fabricators on an increasing tonnage of new projects. Railroad buying is moderately active. The Chesapeake & Ohio has closed on 59,000 tons of rails, of which 18,000 tons, including 1700 tons for the Pere Marquette, was placed with the Bethlehem Steel Co. Further purchases by this railroad include about 3000 tons of plates, shapes and bars and a tonnage of bolts and nuts. Bids will be opened Sept. 27 on 6942 kegs of spikes in addition to a previous inquiry for this material. The Pennsylvania Railroad opens bids this week on 8000 kegs of spikes and 340 tons of steel pipe.

Pig iron is quiet, but the iron and steel scrap market is featured by the purchase of 10,000 tons of heavy melting steel by each of two leading eastern Pennsylvania consumers.

Pig Iron.—Southern iron is still a competitor for eastern Pennsylvania business, but sellers are maintaining a slightly firmer position on prices, with quotations at $13.50 a ton, Birmingham, for foundry iron. Inquiry from eastern Pennsylvania consumers is mostly for lots of 100 to 300 tons of foundry grade and buyers are apparently in no haste to contract for the last quarter. About 2000 tons of floor iron for the Baldwin Locomotive Works, Eddystone, Pa., is reported to have been placed with an Alabama furnace. The American Engineering Co., Philadelphia, has not yet closed

on 1000 tons of foundry iron. Low phosphorus iron is inactive in eastern Pennsylvania, but the Standard Steel Works Co. has bought about 300 tons. The Pulaski furnace in Virginia is scheduled to blow in soon after Oct. 15. With lower production costs following improvements at the furnace, an effort will be made to compete in the Cumberland Valley and other districts.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Reinforcing Bars.—Reinforced concrete projects include several hundred tons in each of two bridges on Henry Avenue, Philadelphia. A building for Girard College, Philadelphia, will require about 500 tons of bars and the Temple Medical School, on which bids were submitted for both structural steel and reinforced concrete, is reported about to be awarded for the latter type of construction. Prices are still irregular, with billet steel bars quoted at 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, with the $5 extra for cutting to length often disregarded by distributers, and 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, is quoted on rail steel bars, with no extra for cutting to length. Prices are at times shaded considerably on rail steel bars.

Plates.—Mills are maintaining a fair rate of operation, but new business is limited to small tonnages. A Harrisburg mill is reported to have received 5000 tons of plates for Norfolk & Western car bodies. The Sun Shipbuilding Co., Chester, Pa., has awarded about 10,000 tons of plates for two South African Steamship Co. liners to the leading interest. The plate price is unchanged at 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Shapes.—In addition to a fair tonnage on their books, mills are quoting on some substantial tonnages of shapes required by fabricators bidding on new projects. Building and bridge business in this district are active, but tonnages are small. Shape prices are unchanged at 1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia.

Sheets.—Galvanized sheets are fairly active, but orders are in small tonnages. Prices range from 3.50c. to 3.60c., Pittsburgh, or 3.82c. to 3.92c., delivered Philadelphia. Black sheets are quiet at 2.85c., Pittsburgh, or 3.17c., Philadelphia. Blue annealed sheet producers are well engaged and maintaining prices at 2.25c. to 2.35c., Pittsburgh, or 3.57c. to 3.67c., Philadelphia, for No. 13 gage, and at 2.10c. to 2.20c., Pittsburgh, or 2.42c. to 2.52c., Philadelphia, for No. 10 gage light plates, blue annealed. The lower range represents prices on desirable business when competition is encountered from continuous sheets.

Old Material.—No. 1 heavy melting steel is quotable at $16 to $16.50 a ton, delivered eastern Pennsylvania, based on purchases last week of 10,000 tons at $16 a ton, delivered, by a Bethlehem, Pa., consumer, and about 10,000 tons at $16.50 a ton, delivered, by a Coatesville, Pa., mill. A Pencoyd, Pa., mill recently closed on a small tonnage of No. 2 heavy melting steel at $14.50 a ton delivered. Heavy breakable cast is quotable at $14.50 to $14.75 a ton, delivered, on the basis of sales of upward of 500 tons in the past week to a Florence, N. J., foundry.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.00 to $16.50
Scrap T rails	15.50 to 16.00
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	14.50 to 14.75
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.00 to 16.50
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Imports.—In the week ended Sept. 21, 1100 tons of chrome ore arrived at this port from Brazil. Steel imports consisted of 222 tons of steel bars (of which 199 tons was from Belgium, 17 tons from France and 6 tons from the United Kingdom), 24 tons of steel bands from Belgium and 20 tons from France, 117 tons of structural shapes from Belgium, 51 tons from Germany and 15 tons from France, 30 tons of steel scrap from the United Kingdom and 26 tons from Germany.

Warehouse Prices, f.o.b. Philadelphia

*For 50 bundles or more: 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more: 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Automobile Slowing Down Affects Sales of Sheets

A slowing down of the automotive industry is reflected in a falling off in the sale of steel sheets, as shown in the monthly report of the National Association of Flat Rolled Steel Manufacturers.

Sales by independent mills during August were 282,107 net tons, a decline of 55,000 tons as compared with July. However, both production and shipments increased. The production, 366,734 tons was a gain of 43,000 tons over the previous month and shipments amounting to 365,649 tons showed a gain of 21,000 tons over July. With the decrease in sales and the increase in production and shipments, unfilled orders declined materially, having been 570,613 tons on Sept. 1, or about 87,000 tons less than on Aug. 1. The August report and comparisons, in net tons, follow:

	August	July	June
Total number of mills.	722	723	722
Capacity per month	492,765	486,430	451,125
Percentage reporting	67.9	67.9	67.8
Sales	282,107	337,222	307,911
Production	366,734	323,905	337,841
Shipments	365,649	344,676	347,989
Unfilled orders	570,613	658,155	676,568
Unshipped orders	108,887	107,751	111,333
Unsold stocks	34,436	47,103	52,274
Percentages of Capacity			
Sales	84.4	102.2	100.6
Production	109.7	98.1	110.4
Shipments	109.4	104.4	113.7
Unfilled orders	170.7	199.4	221.1
Unshipped orders	32.6	32.6	36.4
Unsold stocks	10.3	14.3	17.1

Antwerp Leading Port for Steel Exports

HAMBURG, GERMANY, Sept. 9.—Recent statistics on iron and steel and machinery shipments through Continental ports show that Antwerp is the most important outlet for European exports. Shippers in Hamburg, Brussels and other Continental markets route a considerable tonnage of iron and steel through Antwerp, as appears in the following statistics on the average monthly shipments through five ports in the first half of this year: Stettin, Germany, 48,371 tons; Hamburg, 59,808 tons; Bremen, 5159 tons; Rotterdam, 73,089 tons, and Antwerp, 270,883 tons.

Of the machinery shipments through the five ports, Stettin handled 2887 tons; Hamburg, 12,961 tons; Bremen, 1824 tons; Rotterdam, 4880 tons, and Antwerp, 25,693 tons.

The first of the electrically-driven car ferries being built at Manitowoc, Wis., for the Pere Marquette Railway, was launched into Lake Michigan on Aug. 6. The new ferry represents the first application of turbine-electric drive to car ferries.

Pacific Coast

Demand for Steel Products Shows Gains—2200 Tons for Spokane Pipe Line Awarded

SAN FRANCISCO, Sept. 21 (*By Air Mail*).—Activity in the Pacific Coast markets for iron and steel products continues to gain, and a better volume of inquiries and sales is reported. The plate market has been exceptionally active during the past month, more than 15,000 tons having been booked. Improvement in demand for cast iron pipe is also noted, and pending business now exceeds 8000 tons. Long Beach, Cal., came into the market this week for more than 5500 tons. Among the larger tonnages awarded were 850 tons of reinforcing steel bars for fenders for the Carquinez Straits bridge, Martinez, Cal., and 2200 tons of plates for a pipe line at Spokane, Wash.

Pig Iron.—Foundry pig iron sales and inquiries have called for small tonnages for prompt shipment. Specialty shops, such as stove and sanitary ware units, are working on slightly increased schedules.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars. — Movement of reinforcing steel bars shows a noticeable improvement, especially in the number of projects placed. While many of the lettings involved lots of less than 100 tons, several good-sized tonnages were placed. The 850 tons for the Carquinez Straits bridge fenders went to Gunn, Carle & Co. The Pacific Coast Steel Co. secured 250 tons for log intake locks at Longview, Wash., for the Long Bell Lumber Co., and 600 tons for a loft building in San Francisco was taken by the Soule Steel Co. In the San Francisco district 2.30c., base, is being quoted on carload lots and 2.60c. on smaller tonnages, while the Los Angeles prices are 2.40c. and 2.70c. respectively. Mild steel bars continue firm at 2.35c., c.i.f., but movement is restricted to carload quantities as a rule.

Plates.—Bookings this week were fairly heavy, and in addition to the 2200 tons for the Spokane pipe line, mentioned above, and placed with the Steel Tank & Pipe Co., 360 tons for a welded pipe line at Montecito, Cal., was let to the Western Pipe & Steel Co. The Southern Pacific Co., San Francisco, awarded 100 tons to the Chicago Bridge & Iron Co. for a steel tank and tower at Hachita, N. Mex., and 100 tons for a 30,000 bbl. tank in Los Angeles to the Consolidated Steel Corporation. Bids will be opened Oct. 7 for 140 tons for two siphons at La Mesa, Cal. Despite the fact that a fair tonnage of plate material has been in the market recently, the 2.35c., c.i.f., price is not by any means firm, and large users have been able to shade this figure by $2 or more a ton on desirable specifications.

Shapes. — Bookings of structural material exceed 1500 tons. The largest letting went to Herrick Iron Works for an 850-ton hotel in Oakland. The Minneapolis Steel & Machinery Co. took 125 tons for a bridge at Rio Oso, Cal., and the Judson-Pacific Co. secured 150 tons for an apartment in Burlingame, Cal. Several fair-sized projects are about ready for figures. Shapes remain firm at 2.35c., c.i.f.

Cast Iron Pipe. — The American Cast Iron Pipe Co. has booked 377 tons of 6 to 10-in. Class B pipe for Anaheim, Cal. Other lettings were small. Long Beach, Cal., will open bids on Sept. 24 for 5585 tons of 4 to 12-in. Class B pipe. Whittier, Cal., will open bids on Sept. 23 for 109 tons of 10-in. Class B or Class 150 pipe. On Oct. 1, Compton, Cal., will receive bids on 352 tons of various sizes for sewer work on Long Beach Boulevard. Pleasanton, Cal., will open bids Sept. 30 for 185 tons of 4-in. Class B pipe.

Steel Pipe.—A fair movement of standard steel pipe is reported by pipe mill representatives. Oil country goods, and especially well casing, continues in fair demand. No large pipe line inquiries are current.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¾-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.

Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Shipments Heavy and Prices Are Steadier—Steel Sales Holding Up

BIRMINGHAM, Sept. 24.—Pig iron shipments are continuing at the rate that made August the best month of the year so far, and prospects are that September shipments will equal, if not exceed, those of August. There has been very little increase in stocks in consumers' yards, and the numerous urgent requests for shipments are taken as evidence of an increase in the melt. Fairly satisfactory buying has been going on, and it is estimated by some that slightly over half of the fourth quarter requirements of district consumers are under contract. One company's sales approximate its probable fourth quarter production, so present stocks and recent sales have been confined to regular customers. Some furnaces are continuing aggressive selling policies in competitive territories, although price concessions are less of a factor in securing tonnage than in past weeks. District prices remain firm at $14.50 for No. 2 foundry, and reports are that this is the minimum figure quoted in some of the competitive territories. Thirteen furnaces remain active, of which eight are on foundry and five on basic iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—New business in bars, plates and shapes is well up to the average of the past three or four weeks. Rail demand is much stronger, and it is expected that the Ensley rail mill will be placed in operation again before the end of October. Improved buying is also expected in rail accessories. Prices on box annealed sheets, beginning Oct. 1, will be 3c., a reduction of $2 a ton. All other prices are unchanged. The Bessemer plant of the Pullman Car & Mfg. Corporation, which is to be opened on Oct. 1, has received an order from the Central of Georgia Railroad for 500 gondolas and 500 flat cars. Other orders on hand total more than 1000 cars. The Columbus & Greenville Railway, Winona, Miss., has placed an order with the American Car & Foundry Co. for 300 box cars. The recent recession in demand for fabricated structural steel from both the industrial and public construction fields has reduced the aggregate awards, although shops are well engaged and have substantial backlogs. The Virginia Bridge & Iron Co. has secured an order for 1000 tons for a Government project near New Orleans. The Ingalls Iron Works has booked 275 tons more for the United States Phosphoric Products Corporation plant at Tampa, Fla. Seventeen open-hearths are active of a total of 23, the same as last week.

Cast Iron Pipe.—The United States Pipe & Foundry Co. has booked an order for about nine miles of 16 to 20-in. pipe for Griffin, Ga. New orders of the National Cast Iron Pipe Co. include 3700 ft. of 6-in. and 11,600 ft. of 4-in. pipe for St. Joseph, La. Contracts are pending for 7000 ft. of 6-in. pipe for Nashville, Tenn., and 3700 ft. of 6 and 8-in. pipe for Brooklet, Ga., on which bids were opened last week. Fresh inquiries are light and pending tonnage smaller than two weeks ago. It is the usual lull that precedes the winter buying by municipalities, due to begin in late Oc-

tober. The rush to finish construction projects before cold weather is keeping shipments active. Prices remain at $37 to $38, a net ton Birmingham.

Coke.—With fourth quarter requirements well covered, the movement of foundry coke continues at a rate considered fair for this season. Prices are unchanged from the $5 base for both spot and contract coke.

Old Material.—Demand for steel grades has improved and the market for these lines is approaching normal conditions. The slight interest that developed in cast iron grades last week has subsided. Quotations are unchanged, but prices are stronger for the steel grades.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.50
Tramcar wheels	13.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem	13.50 to 14.00

St. Louis

Pig Iron Consumers Well Covered for Remainder of Year —New Steel Business Light

ST. LOUIS, Sept. 24.—Following a month of heavy sales of pig iron, particularly Southern, the market is quiet, most melters having committed themselves for their requirements for the remainder of the year. There is a much firmer tone to the market, because makers now have large backlogs of orders and are taking business at higher prices than prevailed recently. Some sales were made around $14 to $14.50, f.o.b. Birmingham, it is understood. The St. Louis Gas & Coke Corporation sold about 4500 tons, including 4000 tons to a heating appliance manufacturer; 200 tons of low phosphorus iron to a Louisville melter, 200 tons to a St. Louis stove manufacturer and 150 tons to an Illinois car builder, all for shipment during the remainder of the year.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.00
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—While the volume of new business is light, specifications against contracts for sheets are reported in good volume, with plates, shapes and bars dull. Not much buying is expected until after the turn of the quarter. Structural trade is very quiet, and fabricators with large plants need business badly; the smaller shops are in better shape. The Missouri Highway Commission will let contracts this week, which will require about 1500 tons of reinforcing bars and 200 tons of structural steel.

Old Material.—The market for old material continues weak, and No. 1 and No. 2 heavy melting or shoveling steel are off 25c. No. 2 wrought is 25c. down, and rails and springs are 50c. lower. Railroad offerings have been heavier, and there still is some scrap being shipped in from the country, although this is being cut down because of lower prices. Consumers are willing to buy only at prices which dealers think are too low. Railroad lists: Chicago, Burlington & Quincy, 5625 tons; St. Louis-San Francisco, 18 carloads, and Nashville, Chattanooga & St. Louis, 19 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.00 to $14.50
No. 2 heavy melting or shoveling steel	13.25 to 13.75
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand-sec. rails including frogs, switches and guards, cut apart	16.25 to 16.75
Railroad springs	18.00 to 18.50
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	13.00 to 13.50
Rails for rolling	16.75 to 17.25
Machine shop turnings	7.50 to 8.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	16.00 to 16.50
No. 1 railroad cast	14.75 to 15.25
Stove plate	13.00 to 13.50
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Boston

Weakness Again Develops in Buffalo Pig Iron Prices— Scrap Values Also Lower

BOSTON, Sept. 24.—A New Hampshire foundry last week purchased 400 tons of No. 2X high manganese iron from two furnaces. On this small tonnage fresh weakness developed in Buffalo iron prices. That sale was the largest reported. Furnace representatives say that a considerable tonnage of iron must be bought for last quarter, but foundries apparently are in no hurry to cover. The only open inquiry is for 500 tons of No. 1X from the Westinghouse Electric & Mfg. Co., Springfield, Mass. Last week the Mystic Iron Works passed 500,000 tons in shipments since the stack was blown in Sept. 27, 1926.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	24.11
*Ala., sil. 2.25 to 2.75	24.61
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.

*All rail rate.

†Rail and water rate.

Fabricated Steel.—No sizable tonnages were booked the past week by fabricators, but many small jobs were taken, which in the aggregate made a good showing. The Warren Foundry & Pipe Co. is negotiating with a fabricator for the erection of a foundry at Everett, Mass., which will require several hundred tons, but it is doubtful if work will be started much before Jan. 1. About 2000 tons of steel is pending.

Reinforcing Steel.—The billet steel bar situation is unchanged. Contractors in the market for more than 1000 tons of material are still shopping among mill representatives in the hope of obtaining lower prices. Current bookings are confined to small amounts of steel, with the total for the past week not more than 300 tons, at 2.66½c. a lb., base, from stock. Rail steel bars are quiet at 2.26½c. a lb., delivered common Boston freight rate points.

Old Material.—With shipments to two Pittsburgh district points held up and with prices in that district unsettled, there is less activity here. Prices offered by brokers for heavy melting steel range from $11 a ton on cars, shipping point, to $11.75, but

the lowest price at which sales have actually been made is $11.25. The market for T and girder rails, steel turnings, steel mill borings and long bundled skeleton is easier. New England foundries are buying textile and No. 1 machinery cast quite freely through local or nearby yards. Local exports of scrap from Jan. 1 to Sept. 1 aggregated 22,290 tons. The American steamer Manta, recently sold to Hans Hansen, Oslo, Norway, and her name changed to Ring, is at the local army base loading 2600 tons of scrap for Danzig.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$11.25 to $11.75
Scrap T rails	10.50 to 11.00
Scrap girder rails	10.00 to 10.50
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.60 to 7.25
Cast iron borings (steel works and rolling mill)	6.50 to 6.75
Bundled skeleton, long	9.50 to 10.00
Forge flashings	10.00 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.50
Shafting	14.00 to 14.50
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	9.75 to 10.00

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.00 to 18.50

Cast Iron Pipe.—Providence, R. I., has closed bids on 250 tons of 12-in. pipe, and Foxboro, Mass., is calling for bids on approximately 100 tons of 6-in. Southwick, Mass., has closed bids on 16,524 ft. of 10-in., 13,668 ft. of 8-in., and 1944 ft. of 6-in., but has made no award. Cumberland, R. I., may buy 6200 ft. of 6-in. and 7300 ft. of 4 in. Westwood, Mass., is considering a water project to cost $175,000, and Swansea, Mass., has preliminary plans for a water system to cost $300,000. Foundries are now well sold up on large pipe and the lowest price accepted recently was $39.60 a ton, delivered common Boston freight rate points, as against $39.10 heretofore. Prices quoted openly on domestic pipe are: 4 in., $44.10 to $45.10 a ton, delivered; 6 to 12 in., $40.10 to $41.10; 16 to 20 in., $39.60. The differential on Class A and gas pipe has been raised to $4 a ton, from $3.

Coke.—Producers say there will be no change in the price of by-product foundry coke on Oct. 1. It is now $11 a ton, delivered within a $3.10 freight rate zone. Shipments on last half contracts are holding up well. Demand for domestic coke has improved with cooler weather.

*Including quantity differentials.

Cincinnati

Pig Iron Demand Subsides—Sheet Sales Decline—Scrap Market Quiet and Prices Are Easier

CINCINNATI, Sept. 24.—Sales of pig iron in this district declined last week, consumers entering the market only for about 6240 tons, which, of course, was for fourth quarter. This is about 2000 tons less than the business placed during the preceding week, and was for the most part in small quantities. An order from a central Ohio consumer for 500 tons of Northern foundry iron was the largest reported. Buyers are still indifferent toward covering for all of the fourth quarter and are content generally to anticipate their needs for about 30 days. Furnace representatives report that many melters are carrying over fairly large surpluses of iron. With one furnace still reported to be quoting from $1 to $1.50 under the present Southern iron schedule, other furnaces, which are maintaining prices at about $14.50, base Birmingham, are not doing a great deal of business. Northern furnaces are maintaining prices.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Coke.—While specifications for by-product foundry coke have been received at a steady rate so far this month, the total of coke moved on contract is still under the amount shipped during the same period in August.

Finished Material.—A delayed seasonal recession in sheet demand is being experienced by district sheet mills. While the automobile manufacturers are again in the market, their initial specifications are in smaller quantities than usual. A slackening of demand from other consumers, except metal furniture manufacturers, also has contributed to the decline in fresh bookings in this district. Although backlogs have been reduced in some instances, the leading mill interest reports that decrease of unfilled tonnage has not been great because a substantial amount of new business is for forward delivery. Production has been curtailed to about 72 per cent.

Old Material.—While the better grades of old materials are still none too plentiful, the slackening of mill operations with the consequent reduction in scrap requirements has narrowed the price spread on heavy melting steel and No. 2 wrought to $14 to $14.25. Dealers are not accumulating scrap in large amount, being content to cover on contracts. But they are also careful not to place themselves in a short position.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.00 to $14.25
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.00 to 9.50
Machine shop turnings	8.25 to 8.50
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.00 to 14.25
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Detroit Scrap Weak

DETROIT, Sept. 24.—There have been no changes in scrap prices during the past week in this district, but the market is very weak.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex	3.85c.
Squares	4.35c.
Black sheets (No. 24)	4.05c.
Galvanized sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb	$3.00
Com. wire nails, base per keg	2.85
Cement c't'd nails, base 100 lb. keg	2.85
Chain, per 100 lb	8.75

	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.00
4-in.	33.00
Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

Buffalo

Pig Iron Inquiries Include Several Large Tonnages—Steel Mill Operations at 90 Per Cent—Scrap Easier

BUFFALO, Sept. 24.—An Eastern melter is seeking 4000 to 5000 tons of malleable pig iron, and also from the East are two inquiries, one for 1000 to 2000 tons of malleable and the other for 1000 to 2000 tons of foundry. Buying has been in moderate volume.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Old Material.—The market seems to be a little softer, and buyers are apparently not actively seeking material. There have been no recent sales of No. 1 heavy melting steel. The market for No. 1 machinery cast and stove plate is extremely dull.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:		
No. 1 heavy melting steel	$17.50 to	$17.75
No. 2 heavy melting steel	14.75 to	15.00
Scrap rails	16.50 to	17.00
Hydraul. comp. sheets	14.50 to	14.75
Hand bundled sheets	12.00 to	12.50
Drop forge flashings	14.25 to	14.50
No. 1 busheling	15.50 to	16.50
Hvy. steel axle turnings	14.00 to	14.50
Machine shop turnings	8.50 to	9.00
No. 1 railroad wrought	13.00 to	13.50
Acid Open-Hearth Grades:		
Knuckles and couplers	19.50 to	19.75
Coil and leaf springs	19.00 to	19.50
Rolled steel wheels	19.00 to	19.50
Low phos. billet and bloom ends	20.00 to	20.50
Electric Furnace Grades:		
Short shov. steel turnings	12.50 to	13.00
Blast Furnace Grades:		
Short mixed borings and turnings	11.50 to	12.25
Cast iron borings	11.50 to	12.25
No. 2 busheling	10.00 to	10.50
Rolling Mill Grades:		
Steel car axles	18.75 to	19.25
Iron axles	21.00 to	22.00
Cupola Grades:		
No. 1 machinery cast	16.00 to	17.00
Stove plate	13.00 to	13.50
Locomotive grate bars	12.50 to	13.00
Steel rails, 3 ft. and under	19.50 to	19.75
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Industrial	18.00 to	18.50
Railroad	18.00 to	18.50
Agricultural	18.00 to	18.50
Special Grades:		
Chemical borings	12.50 to	13.50

Finished Iron and Steel.—While operations of local mills continue at approximately 90 per cent, backlogs are tapering. The largest mill in this section continues to keep 22 out of 24 open-hearths in operation and six of its seven blast furnaces, but has reduced two of its larger mills to single turns. Reinforcing bar distributors are interested in the 600-ton job for the new City Hall, and the 1000-ton job for the Hertel Avenue sewer.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb	3.75

Canada

Large Buying of Pig Iron for Fourth Quarter

TORONTO, ONT., Sept. 24.—Business in the Canadian pig iron markets has expanded, following the opening of books for fourth quarter contracts. The demand is more extensive than it was just before the beginning of the second or third quarters, and local blast furnace representatives are of the opinion that commitments for the last three months of the year will be heavy. A number of melters have made known their requirements, and in most cases the amounts involved are in excess of that bought for the third quarter. Carryover tonnages from third quarter are comparatively small, which in itself will mean a larger buying movement as production by foundries and other iron consuming plants has not slackened, but on the contrary some operations have been speeded up. The demand for merchant iron for spot delivery is also in better volume. The production of pig iron in Canada has increased considerably since the end of July. The Algoma Steel Corporation will shut down a portion of its plant at Sault Ste. Marie about Oct. 1 to begin an enlargement program, but is piling iron against future delivery requirements. Producers have made no revision in pig iron prices either for spot or forward delivery.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—In some sections of the country a stronger demand has developed for structural steel and sales in the past week were somewhat better than those in any of the few weeks previous. Fabrication plants are busy and practically all are carrying large unfilled tonnages. Some large orders are pending for early closing.

Old Material.—Little actual change has developed in this market aside from some improvement in demand. Inquiries are in good number and indicate a strong last quarter trade in both iron and steel grades. Dealers are acquiring substantial tonnages against fall and winter requirements. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00

Receiver Is Appointed for United Iron Works Co.

Judge John S. Farrington, a Springfield, Mo., attorney, has been appointed by the Federal Court at Kansas City, Mo., receiver for the United Iron Works Co., which operates four plants in Kansas, Missouri and Oklahoma. Headquarters of the company now is at Tulsa, Okla., and J. H. Campbell is president.

This company formerly had plants at Iola and Joplin, Mo., but both plants were sold some time ago and a seventh plant at Aurora, Mo., was discontinued several years ago.

Fabricated Steel Plate Bookings Light

WASHINGTON, Sept. 24.—Bookings of fabricated steel plate in August were 37,304 tons, or 47.1 per cent of the capacity of the 48 firms reporting to the Department of Commerce and the lowest month's total since January. Orders in July were 48,968 tons or 61.5 per cent of capacity. August orders were distributed as follows: Oil storage tanks, 10,924 tons; refinery materials and equipment, 4254 tons; tank cars, 718 tons; gas holders, 3317 tons; blast furnaces, 365 tons; stacks and miscellaneous, 17,726 tons.

Bookings for the first eight months of the present year aggregated 369,886 tons, or 58 per cent of capacity, against 343,687 tons, or 54.1 per cent of capacity for the corresponding period of last year.

New Republic Tube Plant

The Republic Iron & Steel Co., Youngstown, has approved plans for a new mechanical tubing plant at Warren, Ohio. Construction will be begun at once. The expenditure will amount to $1,000,000. Electrically welded tubing in small sizes will be made from strip steel.

Steel Fabricators to Hold Trade Practice Conference

WASHINGTON, Sept. 24.—Announcement was made yesterday that Commissioner William E. Humphrey of the Federal Trade Commission will preside at the trade practice conference with the structural steel fabricating industry at Biloxi, Miss., on Nov. 11. The conference was called at the request of the American Institute of Steel Construction, which, through a committee, has drafted a code of practices which will be submitted at the Biloxi meeting. The committee is headed by R. T. Brooks. Other members are A. M. Conneen, Jr., H. E. Detwiler, T. J. Foster, R. L. Kift and R. B. Thomas, counsel. The committee was appointed last December by the board of directors of the institute to draft the code.

Not only members of the institute but all other interests engaged in the fabrication and distribution of structural steel will be requested to attend the trade practice conference, the institute has announced.

The code of trade practice for the fabricating industry is intended to do away with unfair practices and deals with misrepresentation, substitution of material, dumping, commercial bribery, selling below cost, and covers also plans and prices, redesigns, unethical bidding, "loading" designs, unenforced contracts and quotations, price discrimination by manufacturers, direct sales, standard contract, standardization of shapes, and enforcement.

Greater Output from Fewer Blast Furnace Men

Data from 37 blast furnace plants employing 12,222 men last March have been compared with similar data from the same number of plants employing 15,329 men in March, 1926.

Of the 37 plants 32 were the same individual establishments. In 1926 the 32 establishments operated 114 stacks and employed 13,888 men, an average of 122 men for each stack. In 1929 the same plants operated 108 stacks and employed 11,095 men or an average of 103 men to each stack.

In spite of the smaller number of men to the stack, output of pig iron for each active stack in March, 1929, was 17,730 tons, compared with 14,900 tons for the corresponding period in 1926. These output figures are those of THE IRON AGE, whereas the figures of employment, etc., came from the United States Bureau of Labor Statistics.

There was a slight increase in the average number of full-time hours in the week's work, which advanced from 59.8 in 1926 to 60.7 in 1929, both comparing with 76.9 in 1913. Hourly earnings increased from 51.7c. in 1926 to 52.8c. in 1929, both comparing with 20.5c. in 1913. Full-time weekly earnings averaged $30.92 in 1926, advancing to $32.05 in 1925, which was more than twice the $15.76 in 1913.

Bethlehem to Increase Sparrows Point Capacity

The Bethlehem Steel Corporation announces that six new open-hearth furnaces will be built at its plant at Sparrows Point, Md. This will increase capacity there about 350,000 to 400,000 tons a year. Expansion of railroad yards at this plant is also planned. These developments are part of the program decided upon by the Bethlehem company in connection with the raising of $51,000,000 last spring by the sale of 600,000 new shares of common stock.

Simplification Experiences with Roller Bearings

WASHINGTON, Sept. 24.—Replies to a questionnaire received from three manufacturers of roller bearings in connection with a survey made for 1928 by the Division of Simplified Practice, Department of Commerce, expressed the view that further standardization is necessary. The concerns reporting were the Bower Roller Bearing Co., Detroit; the Timken Roller Bearing Co., Canton, Ohio, and the Norma-Hoffman Bearings Corporation, Stamford, Conn.

An average of 58 per cent of the production in 1928 conformed to the items listed in the recommendation. One manufacturer listed six non-simplified items for which he thought there exists a sufficient demand to warrant including them in the recommendation. Two of the manufacturers reported that consumer demand does not indicate that further eliminations can be made.

One manufacturer reported that "Some benefits have been experienced from the operation of simplified practice recommendations, although we find it necessary to continue with the large number of sizes we previously made for service requirements. New equipment is almost universally selected from simplified practice recommendation No. 67." Another manufacturer said that the simplified line idea has distinct advantages and should be further promoted from the standpoint of informing the public or users as to how they may cooperate toward securing simplified lines and lower prices. Still another maker reported no benefits had been received. One reported that manufacturers are adhering almost 100 per cent and only require special sizes when absolutely necessary. Another expressed the belief that manufacturers favor the practice of simplification, but that they would not turn down any orders for non-simplified lines.

Automobiles Take First Place in Exports

A new leader in America's export trade appeared during the first half of 1929 when the automobile took first place from cotton, the undisputed leader since the Civil War. This is shown in a review, "Our World Trade," issued by the Chamber of Commerce of the United States.

Exports of automobiles, parts and accessories for the first half of the year totaled $339,160,000, an increase of 36.4 per cent over the same period a year ago. At the same time, exports of raw cotton, amounting to $319,821,000, declined 13.9 per cent in value as compared with the same period a year ago.

Transportation for Chicago

Approximately 150 miles of track can be added to Chicago's surface car lines under a proposed new traction ordinance which permits expenditure of $200,000,000 in a 10-year period. Consideration also is being given to extensions of elevated structures.

Ohio Foundrymen to Meet

Speakers at the annual meeting of the Ohio Foundries Association, Inc., to be held at Toledo on Oct. 10, will be E. J. Lowry, Detroit, consulting metallurgist, who will present a paper on "Advances in Foundry Practice," and L. P. Robinson, Werner G. Smith Co., Cleveland, who will talk on "What Has Become of the Foundrymen's Share of the American Dollar?" The meeting will be held at the Toledo Yacht Club.

Watson Brothers Steel Co., Youngstown, has begun operating its new Detroit warehouse at 17385 Ryan Road, handling steel sheets and hot-rolled and cold-rolled strip steel. R. J. Alton is in charge of the district office there.

Production of Pig Iron and Steel in Canada

	August, 1929	July, 1929	August, 1928
Pig iron, gross tons	112,528(a)	99,786	91,522
Pig iron, gross tons, eight months	730,871	.....	654,957
Ferroalloys, gross tons	7,178	7,030	.....
Ferroalloys, gross tons, eight months	50,801	.....	31,406
Steel ingots, gross tons	113,422	123,248	.....
Steel ingots, gross tons, eight months	940,270	.....	790,764
Steel castings, gross tons	6,860	6,579	.....
Steel castings, gross tons, eight months	48,681	.....	29,058

Figures from Dominion Bureau of Statistics, Ottawa.
(a) New high record; there were only four previous months with over 100,000 tons: December, 1918, with 106,000 tons; October, 1920, with 105,000; May, 1923, with 101,533 tons; December, 1928, with 103,450 tons.

Non-Ferrous Metal Markets

Foreign Sales of Copper 55,000 Tons This Month; Lead and Zinc Buying Improved; Tin Inactive

NEW YORK, Sept. 24.

Copper.—Foreign sales are fairly heavy but buying by domestic consumers is light. Thus far in September sales abroad have totaled about 55,000 gross tons, which is large compared with August and other recent months. Each day such sales amount to considerable and involve principally September and October delivery. Little November metal has been purchased. Domestic consumers are placing small orders each day, principally for October and November delivery. The leading users are well covered for October, but still have considerable to buy for November. Under present conditions they do not need to purchase far ahead. One authority places total September shipments at about 150,000 tons, which is about 8000 tons more than in August. This would leave about 100,000 tons for domestic consumers. Prices are unchanged and firm at 18c. for electrolytic copper, delivered in the Connecticut Valley. The official quotation of Copper Exporters, Inc., is 18.30c. c.i.f., usual European points. Lake copper is moderately active and steady at 18c. to 18.12½c., delivered.

Tin.—Buying is again very light after two days of moderate activity. On Sept. 19 and 20, about 300 tons changed hands and the sales of spot Straits tin for the week ended Saturday, Sept. 21, were about 750 tons as a liberal estimate. The spurt of buying was started by a report that Straits shipments from the East would be only about 6500 tons for September instead of 8000 tons as the estimate early this month. This report caused a good demand on the National Metal Exchange for standard tin and the result was that those who sold bought back Straits tin. The deliveries involved are mostly November and December and the buying was done by dealers. Consumers are purchasing very little metal. Yesterday and today the market was exceedingly quiet but steady. The Hatry episode on the London Stock Exchange had its effect on the tin market and prices have fallen since. Today spot standard tin is quoted at £205 7s. 6d., future standard at £209 5s. and spot Straits at £209 12s. 6d., all lower than a week ago. The Singapore market today was £213 5s. Today in this market spot Straits tin is quoted at 45.25c., New York. For several weeks the price

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Sept. 24	Sept. 23	Sept. 21	Sept. 20	Sept. 19	Sept. 18

Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

has hovered between 45c. and 46c. and this unusual stability is explained partly by the efforts of the London group to stabilize the market.

Lead.—Buying is more active than a week ago and is confined largely to nearby and October delivery. A limited amount is being sold for November. A more active market is expected when all November books are opened. The quotation at St. Louis is firm at 6.70c. and the contract price of the leading interest is unchanged at 6.90c., New York.

Zinc.—Transactions are in larger volume the past week than earlier in the month, but activity is not yet pronounced. Most producers are still holding at 6.80c., East St. Louis, but a limited amount of metal is said to be available for at least prompt shipment at a few points under this. There is no pressure to sell October metal. Conditions are such that a more active market is expected in the very near future. Ore is unchanged at $44, Joplin. Last week's production, estimated at 13,500 tons, was slightly larger than that of the previous week. There was also a slight increase in sales at 10,500 tons, but shipments decreased to 10,882 tons. Surplus is now estimated at 45,465 tons, which contrasts with the peak for the year at 46,610 tons in August.

Antimony.—The market is dull and prices are a little easier, Chinese metal being quoted at 8.62½c. for spot and 8.75c., New York, duty paid, for futures.

Nickel.—In wholesale lots ingot nickel is quoted at 35c. per lb., with shot nickel at 36c. and electrolytic nickel in cathodes at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered, at the published price.

Non-Ferrous Metals at Chicago

CHICAGO, Sept. 24.—Prices for all non-ferrous metals are firm. Individual sales are small, but in the aggregate the tonnage is of fair size. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 46.10c.; lead, 6.80c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.85c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Fully 25,000 Cars Expected to Be Purchased This Fall

THE Burlington road has approved a budget which provides for the purchase of 2000 freight cars, but it is believed in the equipment trade that it may buy considerably more than this number. The Virginian Railway is expected to inquire soon for 2000 cars. A number of other roads are also preparing to send out inquiries. If the inquiries that are expected should materialize, fully 25,000 cars may be purchased within the next month or two, as business now pending totals upward of 10,000 cars. News of the week is given in detail as follows:

Boston & Albany is in the market for 300 gondola car bodies.

Great Northern is building 300 ore cars at its Superior, Wis., shops.

Southern Railway, which inquired for 2000 cars, will, it is believed in the equipment trade, buy about 5000.

Nashville, Chattanooga & St. Louis has ordered 450 center sills for cars from Pullman Car & Mfg. Corporation.

Dupont Co. has ordered 49 tank cars from General American Tank Car Corporation.

Virginian Railway is expected to come into the market soon for about 2000 cars.

Directors of Chicago, Burlington & Quincy have authorized an expenditure of $15,250,000 for equipment, terminal improvements and new trackage. Included in this figure is equipment budget of $8,250,000 for 1930. Equipment orders, it is said, will include 20 passenger and freight locomotives and about 2000 freight cars, the latter including automobile, box, hopper and flat types.

Kansas City Terminal Railway expects to come into the market for a number of 8-wheel switching locomotives.

Nashville, Chattanooga & St. Louis will buy five 4-8-4 locomotives.

Richmond, Fredericksburg & Potomac is figuring on several 4-8-4 type locomotives.

River Steel Shipments Set Record

Movement of steel products on the Ohio River in the Pittsburgh district during August amounted to 137,734 net tons, a new high record. The movement in July was 102,963 tons, while in August, 1928, it was 124,751 tons. The nearest approach to the August total this year was 137,019 tons in November, 1928. Steel traffic on the Monongahela River last month totaled 134,426 tons, as compared with 109,051 tons in July and 109,738 in August, 1928.

Heavy Stocks of By-Product Coke

Stocks of by-product coke at producer's plants Sept. 1 were 2,100,118 tons, according to figures gathered by the United States Bureau of Mines. This is the largest total in many months, comparing with 1,848,920 tons on Aug. 1 and with 1,993,101 tons a year ago. The last named figure was the highest, previously for the past two years.

Reinforcing Steel

With Lettings of 2700 Tons, Market Is Still Quiet

THE reinforcing steel market continues quiet with lettings in the past week having totaled only 2700 tons. Forty-seven hundred tons was added to pending work. The largest inquiries were 1500 tons for bridges and culverts in Missouri and 1000 tons for a sewer in Buffalo. Awards follow:

CLEVELAND, 175 tons, Cedar Point road bridge for Cuyahoga County, to Bourne-Fuller Co.

CLEVELAND, 150 tons, Jail Courts Building, to Patterson Leitch Co.

CLEVELAND, 130 tons, Cleveland Union Terminal work, to Bourne-Fuller Co.

GREENCASTLE, IND., 100 tons, building for DePauw University, to Concrete Engineering Co.

NORTH CHICAGO, ILL., 300 tons, Veterans' Hospital, to American System of Reinforcing.

MAYWOOD, ILL., 105 tons, Veterans' Hospital, to Concrete Enginering Co.

GREEN BAY, WIS., 175 tons, office building, to Concrete Engineering Co.

SHEBOYGAN, WIS., 500 tons, water works and filtration plant, to an unnamed bidder.

SAN FRANCISCO, 850 tons, fenders for Carquinez Straits bridge, to Gunn, Carle & Co.

SAN FRANCISCO, 600 tons, printing plant, First and Tehama Streets, to Soule Steel Co.

SACRAMENTO, CAL., 285 tons, paving in Sonoma and Marin Counties, to unnamed bidder.

LONGVIEW, WASH., 250 tons, intake log locks, Long Bell Lumber Co., to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 250 tons, hospital.

NEW YORK, 100 tons, bridge on Staten Island.

BUFFALO, 1000 tons, Hertel Avenue sewer.

PHILADELPHIA, 500 tons, building for Girard College; Day & Zimmermann, Inc., engineers.

PHILADELPHIA, 500 tons, Temple Medical School; bids originally submitted on structural steel construction.

PHILADELPHIA, 150 tons, second bridge on Henry Avenue over Wissahickon Creek.

CHICAGO, 300 tons, Chicago River straightening project.

CHICAGO, 300 tons, for city bridges.

CHICAGO, 235 tons, St. Elizabeth Hospital.

CHICAGO, 400 tons, apartment building at Fifty-second Street and Blackstone Avenue.

CHICAGO, 200 tons, warehouse for Kroger Grocery Co.

CHICAGO, 150 tons, Fine Arts Building; R. C. Wieboldt & Co., general contractors.

MOLINE, ILL., 200 tons, building for Fifti Avenue Realty Co.

JEFFERSON CITY, MO., 1500 tons, bridges and culverts for Missouri Highway Commission.

PERSONAL

RALPH S. COOPER, vice-president and general manager of the Independent Pneumatic Tool Co., Chicago, has been elected president to succeed John D. Hurley, deceased. Mr. Cooper has been identified with the company successively as manager of the New York office, Eastern manager and vice-president in charge of Eastern sales, since his graduation from Cornell University in 1903. NEIL C. HURLEY has been elected a member of the executive committee and RAYMOND J. HURLEY has been elected a director.

—

CHARLES M. SCHWAB, chairman of the Bethlehem Steel Corporation, will be the principal speaker at a house warming to be held in the new quarters of the Chamber of Commerce of Pittsburgh on Sept. 26. T. M. GIRDLER, president, Jones & Laughlin Steel Corporation, Pittsburgh, is to be toastmaster at the meeting.

—

L. WEIMER MURRAY, for the past 15 years with the General Refractories Co., Philadelphia, has resigned as district sales manager of the Chicago office of the company. He is being succeeded by PHIL C. LEONARD.

—

E. A. PERRY has been appointed purchasing agent at Johnstown, Pa., for the National Radiator Corporation, succeeding R. D. FELTON.

—

RICHARD M. EGAN, president, Egan, Webster & Co., Oliver Building, Pittsburgh, producers of fire clay and silica clay, with plants at Birmingham, West Darlington and Claytonia, Pa., has been made assistant to the president of the General Refractories Co., Philadelphia, but will continue as head of the former company and will retain his headquarters at Pittsburgh.

—

PRICE M. DAVIS has been elected president and general manager of Shadboldt & Boyd Co., Milwaukee, jobbers in machinists' and mill supplies, to succeed FRANK ELLIS, who retired after 55 years with the company, with which he started as office boy. Mr. Davis has been with the company 35 years and has held the position of general manager for some years.

—

J. C. TAYLOR, JR., has been appointed vice-president in charge of sales of the Taylor-Wharton Iron & Steel Co., High Bridge, N. J., effective Sept. 20.

—

DR. CARL KOETTGEN, president of the Verein Deutscher Ingenieure and general director Siemens-Schuckert Works, Berlin, tendered a luncheon Sept. 18 at the Railroad Club, New York, to American engineers who, as members of a reception committee, have been welcoming engineers from abroad en route to the World Engineering Congress in Japan. Associated with him in the luncheon were DR. CONRAD MATSCHOSS, the general executive officer of the Verein Deutscher Ingenieure, DR. EMIL PROBST, of Baden, PROF. D. THOMA, of Munich, and DR. KARL G. FRANK, New York representative of the Siemens-Schuckert Works.

—

O. A. FULTON, of Wheelock, Lovejoy & Co., Boston, was nominated treasurer of the American Society for Steel Treating at the annual convention of the society, Sept. 9 to 13.

O. A. FULTON

Through his influence considerable money was raised for the 1922 annual convention in Boston, which helped to make that meeting a pronounced success, and his counsel and advice have been of decided value to those interested in the management of the organization. The nomination of Mr. Fulton insures his election and he takes office Jan. 1, 1930, succeeding J. M. WATSON, metallurgist, Hupp Motor Corporation, Detroit, who has been made vice-president. Mr. Fulton is elected for a term of two years.

—

OTTO ABRAHAMSEN, formerly in charge of sales of power hammers for the Beaudry Co., Inc., Boston, has become identified with the Moloch Foundry & Machine Co., Kaukauna, Wis., and will handle sales of Moloch hammers. The company plans to add a line of pneumatic forge hammers for heavy work and board drop hammers.

—

JORDON KORP, in charge of the service department of the furnace division of the Leeds & Northrup Co., Philadelphia, spoke on practical heat treating at the first fall meeting, Sept. 18, of the Worcester, Mass., chapter of the American Society for Steel Treating.

—

JOSEPH W. ESHELMAN has been appointed representative in the Birmingham, Ala., district, with offices in the American Traders Bank Building, Birmingham, by the Pennsylvania Pump & Compressor Co., Easton, Pa.

—

HOWARD BUTT, formerly sales manager of the Air Preheater Corporation, Wellsville, N. Y., has joined the staff of the Hahn Engineering Co., New York, a division of the Lancaster Iron Works, Lancaster, Pa.

—

ALEXANDER L. FEILD, heretofore with the Union Carbide & Carbon Research Laboratories, New York, has become associated with the Simonds Saw & Steel Co., Boston, in the capacity of research engineer. His headquarters will be at the Simonds mills at Lockport, N. Y., where he will be in charge of experimental and development work on electrometallurgical processes and particularly on the electric furnace production of alloy steels.

—

GEORGE P. HULST, for many years superintendent of the American Smelting & Refining Co. plant at Omaha, Neb., has been appointed superintendent of the plant at Indianapolis of the American Lead Co.

—

JAMES BRYDEN, works manager of Smith & McLean, Ltd., sheet and bar makers and galvanizers, Glasgow, Scotland, arrived in the United States Sept. 20 for a visit of industrial plants over a stay of several weeks.

Prize Awarded for Paper on Price Stabilization

A prize of $100 for the best suggestions on price stabilization, offered by Dixon C. Williams, president, Chicago Nipple Mfg. Co., Chicago, has been awarded to Dr. C. Copeland Smith, president of the League of Reconciliation, Chicago, who offered his recommendations under the title, "Stabilization versus Suicide." His paper, together with one by Hon. Felix Levy, attorney, New York, is being distributed in a bulletin by the Chicago Nipple Mfg. Co. Mr. Levy, feeling that his professional contacts with the subject might give him some advantage, made his contribution with with the understanding that it would not be considered as an entry in the contest. Judges were J. C. McEwen, R. C. Mead and Herman Hoelscher.

Price Iron & Steel Co., Chicago, dealer in scrap iron and steel, announces the closing of its Milwaukee office. The Wisconsin territory will be in charge of H. S. Lewis, who will make his headquarters at the Chicago office.

OBITUARY

FREDERIC R. WICKWIRE, vice-president and purchasing agent of Wickwire Brothers, Cortland, N. Y., died at his home in Cortland, Sept. 17, aged 46 years. He was a son of the late Chester F. Wickwire, who was

F. R. WICKWIRE

a pioneer in the wire industry. After graduation from Sheffield Scientific School, Yale University, with a Ph.B. degree in 1905, he entered the employ of Wickwire Brothers. In 1910 he became secretary of the company and in 1924 he was made vice-president, which position he held at the time of his death.

—

GEORGE T. ROWLAND, JR., engineer associated with William & Harvey Rowland, Inc., Philadelphia, died Sept. 16.

—

JACOB TYRAKOWSKI, superintendent of the McCarthy Foundry Co., Chicago, died Sept. 12 of pneumonia. He was a director of the Metropolitan State Bank and an executive of several building and loan associations.

—

HARRY F. BAYLEY, until recently president of the Bayley Structural Iron Co., Milwaukee, Wis., and a manufacturer of iron and steel products for many years in that city, died Sept. 17, aged 62 years. Previous to the organization of the structural iron concern he had been president of the William Bayley & Sons foundry, established by his father. Illness forced his retirement from business two years ago.

—

JAMES A. ROSS, retired boiler manufacturer, died Sept. 16, at his home at Summit, Ill., aged 81 years. He was born in Ballblair, Scotland, and went to Chicago 41 years ago, founding the Ross Boiler Co., of which he was president until his retirement several years ago.

THOMAS F. HOWE, who was identified for 20 years with the Interstate Iron & Steel Co., Chicago, died Sept. 18, aged 69 years. He retired from active service with the company about two years ago.

—

CHARLES J. MOORE, retired automobile manufacturer, and since 1927 vice-president of the National Safety Council, died Sept. 19 at his home in Longmeadow, Mass. At one time he manufactured bicycles at Westfield, Mass., and in 1901 became associated with a group that made the Packard automobile. He retired from business nine years ago.

Present Status of Nitrided Steel

(*Concluded from page* 841)

gines, especially aircraft engines; the wear is almost nil, and keeps consumption of lubricating oil at a minimum.

In the American automobile industry the commonest application is probably water pump shafts, where the corrosion resistant properties of the hard case enables it to replace the more expensive monel metal or stainless steel. Steering segments and worms, and timing gears are being more widely adopted; the extra cost of the steel is more than overbalanced by the losses in carbonized products due to soft spots and warpage. A most promising field is opening up in connection with aluminum alloy pistons and connecting rods, since it has been found that nitrided piston pins and crankshafts can run against aluminum alloys without the usual bronze or babbitt bushing. Transmission gears and worms of nitralloy have not yet been commercialized in America.

One very notable success has been achieved in the manufacture of stems and seats for high temperature steam valves. Nitrided steel resists the type of abrasion known as wire cutting; the strength of the alloy at high steam superheat is good, and the coefficient of thermal expansion is the same as the alloy steel valve body used. Nitralloy also makes very satisfactory liners for high-pressure pumps handling hot liquids. Piston rods for this service have also been satisfactory when graphite packing has been avoided; flakes of graphite remaining on the rods at the end of the running length cause excessive pitting. German State railroads have standardized on nitrided liners for crosshead guides. Many experiments are under way on the utility of nitrided blades for steam turbines, especially in the low-pressure stages where erosion of the ordinarily used 3-per cent chromium steel causes expensive replacements.

In the machine tool field, Mr. De Fries said that shafts, spindles and ways on grinders will last many times as long as usual equipment when they possess the hard nitrogen case.

Production and Shipments Balanced, Say Statisticians

New production records were made during August in many lines of activity, according to the September report on business conditions of the Conference of Statisticians in Industry, operating under the auspices of the National Industrial Conference Board, New York. But while the high rate of industrial operation, in contrast with summer a year ago, continued to be reflected in the August reports, the slight recession noted in July as compared with June continued into August, although it did not spread to all divisions.

Noteworthy is the continued consumer demand for automobiles. Although production of passenger cars and trucks during August surpassed that of corresponding months of all previous years, and was only slightly below July output, purchases evidently are keeping pace with this record production. July registrations and foreign sales reached 581,893 units, as compared with the July output of 517,792 cars.

Wholesale and retail demand generally gives many indications of being greater than last year and fairly well sustained. Stocks on hand in general showed no undue accumulation and, with the possible exception of steel and copper, shipments and orders continued to be fairly well balanced with production.

Mileage Rate Decision Is Protested by New York

WASHINGTON, Sept. 24.—Treatment accorded Philadelphia and Baltimore in the mileage scale set up in the Eastern steel rate decision is held by the New York Chamber of Commerce to be unfair and prejudicial to New York and is cited as one reason in a petition filed by the chamber asking that the Interstate Commerce Commission reopen the case for further hearing. The commission recently announced postponement of the effective date of the decision to Dec. 20 from Oct. 20. The railroads asked that the date be postponed to give them time to prepare the tariffs.

A civil service examination for senior engineer for welding has been announced. Applications must be on file not later than Oct. 16. A vacancy is to be filled in the Bureau of Construction and Repair, Navy Department, Washington. The entrance salary is $4,600 a year.

Fabricated Structural Steel

Forty Per Cent of Awards, Totaling 35,000 Tons, Are for Work in New York Metropolitan Area

CONTRACTS placed for structural steel in the past week totaled 35,000 tons, a rather sharp decline from the 50,000 tons of the previous week. Close to 40 per cent of the tonnage will be required for work in the New York metropolitan district. Most of the steel is continuing to go into non-industrial structures. The largest jobs were 6000 tons for a New York hotel and 2500 tons each for a New York office building and for five river barges at Pittsburgh.

Inquiries which appeared during the week amounted to 37,000 tons and from the standpoint of tonnage were about equally divided among industrial buildings, non-industrial projects and bridge and grade crossing elimination work. Five thousand tons will be needed for an office building in Milwaukee and 4500 tons for 50 barges at Pittsburgh. Awards follow:

FAIRFAX FALLS, VT., 100 tons, State bridge, to unnamed fabricator.

BOSTON & MAINE RAILROAD, 275 tons, five bridges, to Boston Bridge Works, Inc.

LITTLE FALLS, N. Y., 315 tons, high school, to Jones & Laughlin Steel Corporation.

PEEKSKILL, N. Y., 181 tons, Paramount Theater, to Levine Iron Works.

NEW ROCHELLE, N. Y., 103 tons, bank and office building, to Grand Iron Works.

SCARSDALE, N. Y., 213 tons, telephone building, to Steel Fabricators Corporation, 11 West Forty-second Street, New York.

HEMPSTEAD, N. Y., 1450 tons, telephone building, to Hay Foundry & Iron Works.

LONG ISLAND RAILROAD, 200 tons, bridge repair work, to American Bridge Co.

NEW YORK, 800 tons, building at 409 East Sixtieth Street for Knickerbocker Ice Co., to McClintic-Marshall Co.

NEW YORK, 6000 tons, 40-story hotel at 160-170 West Fifty-ninth Street for Lefcourt interests, to A. E. Norton, Inc.

NEW YORK, 1100 tons, addition to Western Hotel at 30 East Fiftieth Street, to Paterson Bridge Co.

NEW YORK, 481 tons, public schools Nos. 230 and 5, to Harris Structural Steel Co.

NEW YORK, 173 tons, sanitarium at 1425 Zerega Street in the Bronx, to B. Schacht & Sons.

NEW YORK, 2500 tons, office building at 66-68 Cedar Street, to Harris Structural Steel Co.

NEW YORK, 198 tons, addition to 10-story building at 236-250 West Thirty-seventh Street, to Dreier Iron Works, Inc.

BROOKLYN, 151 tons, building at Fifth Avenue and Twelfth Street, to Steel Fabricators Corporation, 11 West Forty-second Street, New York.

ELIZABETH, N. J., 608 tons, telephone building, to Hinkle Iron Co.

JERSEY CITY, N. J., 393 tons, Brunswick Laundry on Liberty Street, to F. G. Shaefer Iron Works.

LAKE DENMARK, N. J., 215 tons, ammunition buildings for United States Navy, to Penn Bridge Co.

ATLANTIC CITY, N. J., 400 tons, Hotel Denis, to Kallman Steel Co.

TRENTON, N. J., 600 tons, building for John T. Roebling & Sons, to Belmont Iron Works.

WILMINGTON, DEL., 900 tons, building for Pusey & Jones Co., to Belmont Iron Works.

BALTIMORE, 300 tons, airplane hangars for Stone & Webster Co., to Dietrich Brothers.

BALTIMORE & OHIO RAILROAD, 665 tons, 215 tons for bridge at St. Denis, Md., to Mount Vernon Bridge Co., and 450 tons for bridge at Kensington, Ind., to American Bridge Co.

ANN ARBOR, MICH., 700 tons, two buildings for University of Michigan, to Massillon Bridge & Structural Co.

SAGINAW, MICH., 1500 tons, telephone exchange building, to American Bridge Co.

MIDLAND, MICH., 1000 tons, power house for Dow Chemical Co., to R. C. Mahon Structural Steel Co.

ADA, MICH., 120 tons, State highway bridge, to American Bridge Co.

DETROIT, 170 tons, Michigan State highway bridge, to McClintic-Marshall Co.

PITTSBURGH, 2500 tons, five tow boats for Standard Unit Navigation Co.; three to Dravo Contracting Co., and two to Charles Wood Engineering Works.

BEAVER FALLS, PA., 1084 tons, building for Babcock & Wilcox Co., to McClintic-Marshall Co.

CLEVELAND, 900 tons, County jail-courts building, to Massillon Bridge & Structural Co.

CLEVELAND, 500 tons, convent, Home of Good Shepherd, to Pittsburgh Bridge & Iron Co.

NEW ORLEANS, 1000 tons, Federal Government project, to Virginia Bridge & Iron Co.

TAMPA, FLA., 275 tons, United States Phosphorus Products Co., plant, to Ingalls Iron Works.

CHICAGO, 1000 tons, sintering plant for Inland Steel Co., to Lakeside Bridge & Steel Co.

NORTHERN PACIFIC, 100 tons, girder span, to American Bridge Co.

MILWAUKEE, 1350 tons, Mariner Tower building, to American Bridge Co.

BURLINGAME, CAL., 150 tons, apartment building on Bellevue Avenue, to Judson-Pacific Co.

RIO OSO, CAL., 125 tons, bridge, to Minneapolis Steel & Machinery Co.

OAKLAND, CAL., 850 tons, hotel, Fourteenth and Jackson Streets, to Herrick Iron Works.

MONTECITO, CAL., 360 tons, plates, 18-in. welded steel pipe line, Montecito County Water District, to Western Pipe & Steel Co.

LOS ANGELES, 100 tons, plates and shapes, 30,000 bbl. tank for Southern Pacific Co., to Consolidated Steel Corporation.

SAN FRANCISCO, 100 tons, plates and shapes, steel tank and tower, Southern Pacific Co., for erection at Hatchita, N. M., to Chicago Bridge & Iron Works.

SPOKANE, WASH., 220 tons, 36 and 48-in. pipe line, to Steel Tank & Pipe Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 300 tons, fire station, Bowdoin Square, refigured.

NEEDHAM, MASS., 100 tons, high school.

STATE OF NEW YORK, 1400 tons, six highway bridges.

NEW YORK, 2650 tons, apartment building on West Eighty-first Street.

NEW YORK, 40,000 tons, Empire State Building; general contract to Starrett Brothers, Inc.

NEW YORK, 9300 tons, section 9, route 101, of subway; bids rejected and revised bids to be taken later.

NEW YORK, 1100 tons, store addition for Bloomingdale Brothers, Inc., on Fifty-ninth Street.

NEW YORK, 250 tons, housing station on West Farms Road for New York Department of Plants and Structures.

NEWARK, N. J., 2500 tons, Kent garage.

NEW HAVEN, CONN., 1500 tons, Sterling Law School Building at Yale University.

NEW HAVEN, 800 tons, Institute of Human Relations Building at Yale University.

BALTIMORE & OHIO RAILROAD, 160 tons, bridge on Staten Island, N. Y.

PENNSYLVANIA RAILROAD, 1000 tons, five bridges.

PHILADELPHIA, 500 tons, Warner Brothers Film Exchange building.

MEDIA, PA., 750 tons, County Court House; Ayrie-Houser & Co., general contractors.

PHILADELPHIA, 1400 tons, office building for I. Fischman & Co.; Turner Construction Co., general contractor.

PHILADELPHIA, 1100 tons, bridge over Wissahickon Creek on Henry Avenue.

PHILADELPHIA, 1600 tons, building for Girard College; Day & Zimmermann, Inc., engineers.

BALTIMORE, 500 tons, Young Men's and Women's Hebrew Association building.

LEHIGH VALLEY RAILROAD, 200 tons, two bridges at Amherst, N. Y.

BALTIMORE, 800 tons, Forty-first Street bridge.

BEDFORD COUNTY, PA., 115 tons, highway bridge.

PITTSBURGH, 4500 tons, 50 barges for Standard Unit Navigation Co.

BARBERTON, OHIO, 500 tons, evaporator building for Columbia Chemical Division of Pittsburgh Plate Glass Co.

GRAND TRUNK RAILROAD, 2000 tons, grade crossing elimination work at Detroit.

JANESVILLE, WIS., 700 tons, highway bridge.

KEWAUNEE, WIS., 500 tons, highway bridge.

MILWAUKEE, 5000 tons, 42-story building for Northwestern Life Insurance Co.

CHICAGO & NORTH WESTERN, 400 tons, movable bridge.

POWERTON, ILL., 3500 tons, power plant for Super-Power Co.

JEFFERSON CITY, MO., 200 tons, bridges and culverts for Missouri Highway Commission.

LA MESA, CAL., 140 tons, plates, two siphons for La Mesa, Lemon Grove and Spring Valley Irrigation District; bids Oct. 7.

OAKLAND, CAL., 100 tons, apartment building in Lake Merritt District. Bids being taken.

Better Feeling in European Markets

British Pig Iron Demand Heavier and German Steel Orders Result in Large Production—Cartels Again in Evidence—1100-Ton Furnace Blown In

(*By Cable*)

LONDON, ENGLAND, Sept. 23.

PIG IRON demand is improving steadily, as Cleveland furnaces are now able to give early delivery. Midland producers are considering advancing quotations because of increasing costs.

Hematite iron producers are asking advanced prices, which are still insufficiently remunerative. Increased sales have been effected, however, and hopes are expressed of advancing quotations still further.

Finished steel demand is spasmodic as releases from shipyards are irregular and some plate mills are well situated while others are in need of orders. Increased prices are being considered, but at a meeting of the Steel Association last week it was decided to make no revisions at present.

British consumers of foreign sheet bars are still buying, but demand for billets and other material is very light. Merchant bar mills need orders and are reported to have accepted business at £5 9s. per ton (1.18c. per lb.) f.o.b., although current quotations are £5 11s. to £5 11s. 6d. per ton (1.20c. to 1.21c. per lb.)

There is a strong demand for tin plate with rising prices. Inquiry from overseas users is good and further substantial business is expected. Makers are well engaged, but are faced with a possible increase in costs as a result of the uncertain Welsh coal situation, as the coal wage agreement is shortly due for revision.

Galvanized sheets are quiet. English mills have reduced prices on Japanese light gage black sheets to attract business and inquiry is improving.

The North British Locomotive Co. has secured contracts for six locomotives from the Rhodesia Railway and six from the Sao Paulo Railway in Brazil. Sir W. G. Armstrong, Whitworth & Co. will build 30 locomotive boilers and R. & W. Hawthorn, Leslie & Co., 15 boilers for the Argentine Railways.

German steel ingot output in August was 1,401,000 metric tons and rolled steel production was 1,013,000 tons.

Steel Cartel to Be Renewed

Provisional Extension Expected, Pending Decision to Adopt New Quotas for Home and Export Trade

BERLIN, GERMANY, Sept. 10.—The approaching meeting of the International Steel Cartel on Sept. 26 has influenced buyers to delay placing orders except for immediate needs. Renewal of the cartel for a long period is not possible at the coming meeting, since the special committee on exports has not completed its investigation, but provisional renewal is expected. The committee on exports was appointed at the previous meeting in Brussels to collect data on exports of iron and steel as related to production and rated capacity in member countries. The investigation followed a French suggestion that separate domestic and export quotas be fixed for all member countries and that penalties for excess exports be applied just as excess production is penalized under the present agreement. This, it is believed, would prevent undue expansion of export trade and consequent excessive competition. German members of the cartel point out that separate quotas would be unnecessary if the German suggestion of separate selling syndicates for various products were adopted.

Germany is still objecting to the present quotas and will doubtless make further protests at the coming meeting. Since Jan. 1, 1927, the quotas have been 43.18 per cent for Germany, 5.78 per cent for the Saar, 31.18 per cent for France, 11.56 per cent for Belgium and 8.3 per cent for

British and Continental European Export Prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp with the £ at $4.85

Wire nails, assortments, 1 to 6-in., keg	10	6½				2.23		

*Open-hearth steel, 10s. ($2.42) per ton extra.

Luxemburg. It is pointed out that these quotas permit Germany to produce only 79 per cent of its largest month's output while France is allowed 99.6 per cent of its largest month's production and Belgium 87.1 per cent.

British producers have not been invited to attend the coming meeting of the cartel, but the recent mergers of British Northeast Coast steel producers and the opinions expressed by Sir William Larke of the National Federation of Iron and Steel Manufacturers are cited as factors favoring an early British entry. Although Polish membership in the cartel is foreshadowed by the negotiation of an agreement with Germany, this understanding does not become effective until a general commercial treaty has been made between the two countries.

German Steel Business in Good Volume

Refunds to Exporting Manufacturers Increased—Wire Exports Satisfactory, But Cartel Reduces Prices

BERLIN, GERMANY, Sept. 10.—The wire syndicate has reduced domestic prices 0.50 m. to 2.50 m. (12c. to 60c.) per 100 kg., having been unable to obtain its official prices for some time, because of outside competition. Price reductions to dealers have been increased and the syndicate is making a further effort to make dealers buy exclusively from its members.

Following a recent decline in Continental prices, the ingot steel syndicate has increased its refunds on material bought by manufacturers for export. The new refunds, representing the difference between the German domestic prices and the "world market" prices are: Ingots, 27 m. ($6.43); billets, blooms and slabs, 17 m. ($4.05); structural shapes, 32.50 m. ($7.74); steel bars, 27 m. ($6.43); bands, 42 m. ($10), and heavy-gage sheets, 27 m. ($6.43).

Recently the *Frankfurter Zeitung* has complained of American "dumping" of steel products and has published figures intended to show that American export quotations are from 21 to 51 per cent less than American domestic prices for important items. It is claimed that the American export price for open-hearth steel rivets is 71 per cent less than the American domestic price. It is admitted, however, that these prices are not necessarily lower than European quotations.

The outlook for steel business continues good and recent weakness in Continental market prices is attributed to the high rate of production rather than to any definite decline in demand. Railroad car builders are booking more orders, and substantial rail orders are expected soon as a result of plans announced by the Railroads Corporation, which is increasingly replacing existing track with 30-meter rails. Wooden ties are also being replaced with steel.

Export trade is satisfactory, especially in wire rods and wire products. Total exports of wire rods, wire and wire products in the first half of the year were 372,497 metric tons, compared with 607,724 tons in all of 1928. Sales to Argentina, Brazil and Chile have been larger this year, Brazil alone taking about 10,000 tons of barbed wire in the first half.

The Netherlands Railroads have ordered 1700 freight cars from the Westdeutsche Waggonfabriken A. G., the Mainz-Castl-Werk and the Hannoversche Waggonfabrik. A number of small reparations contracts have been concluded with France, and recently the Deutsche Werft at Hamburg received an order on reparations account for a 7000-ton floating dock for Jugoslavia.

German Thin-Gage Sheet Cartel Being Formed

BERLIN, GERMANY, Sept. 10.—Progress is being made toward the establishment of a thin-gage sheet syndicate including all German producers. The Feinblechkontor G.m.b.H., formed early this year, provides a nucleus, but does not include all makers. Formerly the Hoesch works opposed membership in a syndicate, objecting to any export control. This company does not wish to enter the export markets, since it is able to dispose of its entire output domestically. However, it is understood to have agreed to join a syndicate operating only in the German domestic market.

The original thin-sheet syndicate in Germany was formed in 1902 and included 45 mills, with a total production quota of 372,100 tons. It was dissolved in 1904 because of competition by non-members, which were making 30 per cent of the total production of Germany at that time.

German Mills Plan Further Modernization

HAMBURG, GERMANY, Sept. 9.—Expenditures of German steel works for plant modernization and improvements have been much smaller this year than in 1927 and 1928, but as most mills are in a favorable financial position now, further expansion is expected next year. The Vereinigte Stahlwerke A. G., Düsseldorf, has completed its program of blast furnace construction, blowing in the eighth furnace at Duisburg-Hamborn, a stack with a daily capacity of 1100 metric tons. The expansion program of the corporation this year has also affected coke and by-products plants and the manufacture of hardware.

Plans are now being made by the Vereinigte Stahlwerke A. G., Mannesmann Rohrenwerke, Hoesch Eisen und Stahlwerk and the Klockner Werke A. G. for the construction of new rolling mills and the concentration of output in fewer plants. No additional blast furnaces have been proposed. It is now believed unlikely that Friedrich Krupp A. G., Essen, will build a tube mill.

To Compete with Steel and Wire Rod Cartels

HAMBURG, GERMANY, Sept. 9.—The Stahlwerk Becker A. G., Willich near Krefeld, will shortly be in a position to book orders for certain semi-finished steel products. As it is not a member of the German Steel Cartel, the Becker company is expected in some quarters to undercut the prices of cartel members. The company has completed its new wire rod mill, which will have an annual capacity of 40,000 tons, and will probably sell the entire output to non-members of the German wire syndicate. This development should have an important effect on the wire market, as, in the past, wire makers not included in the wire syndicate have been charged an extra of 17.50 m. ($4.02) a ton for wire rods and have been largely dependent upon importers for their supplies.

Another domestic move against cartel control is apparent in the announcement that the Rheinmetall A. G., which is controlled by the German Dye Stuff Corporation, will get its new bar mill into operation in October. Bars and shapes will be sold by this company in competition with the German Steel Syndicate, as the Rheinmetall A. G. is not a member.

General Electric Officers on German Board

BERLIN, GERMANY, Sept. 10.—At a meeting of stockholders of the Allgemeine Electricitäts Gesellschaft a recent agreement, under which part of the company's stock was acquired by the General Electric Co., was unanimously approved. Four American members have been elected to the board of supervision: Owen D. Young, chairman of the board, and Gerard Swope, president, General Electric Co., and Clark H. Minor, president, and E. Arthur Baldwin, vice-president, International General Electric Co. A fifth seat on the board will also be occupied by an American.

The Gray Iron Institute will hold its annual meeting Oct. 16 at the Hotel Cleveland, Cleveland. A. J. Tuscany, Terminal Tower Building, Cleveland, is manager.

Machinery Markets and News of the Works

Tool Sales Are Lighter

September Volume, Though Large, Is Below That of August —Prospects Encouraging

WITH numerous buyers postponing the placing of orders until they have had an opportunity to inspect the new equipment to be displayed at the National Machine Tool Exposition in Cleveland next week, sales have tapered somewhat in all machine tool markets.

Even in the New York district, where business has been sustained at an unusually brisk pace, September bookings have been less than those in August. However, the machine tool industry is looking to the immediate future with confidence and is of the opinion that sales during the fall months will be in satisfactory volume. In fact, the temporary pause in activities has been welcomed by builders as an opportunity to catch up somewhat on unfilled orders.

The General Electric Co., Western Electric Co., United States Aluminum Co. and Westinghouse Electric & Mfg. Co. have been substantial buyers in the past week. The General Electric Co., however, is expected to purchase only about one-fourth of the list of 80 tools which it recently sent out. The Westinghouse company has been contracting for equipment in addition to that for its regular quarterly requirements.

The Houdaille-Hershey Corporation, Buffalo, manufacturer of shock absorbers, has appropriated $200,000 for the purchase of machine tools.

Business from the automobile industry has been noticeably light. Most orders have been for one or two machines each from widely diversified sources.

New York

NEW YORK, Sept. 24.—Machine tool business in this district so far this month continues at a good pace, although the volume is less than in August. Included in the week's business were 11 radial drills bought by one company. The General Electric Co. and the Western Electric Co. have been substantial purchasers during the week, although General Electric, it is stated, will buy only about one-fourth of the recent list of 80 tools it sent out. The Ingersoll-Rand Co. has bought a few tools. Some buying that has been in prospect has been postponed until after the National Machine Tool Exposition, which is to be held in Cleveland next week. The Houdaille-Hershey Corporation, Buffalo, manufacturer of shock absorbers, has appropriated $200,000 for additional machine tool equipment.

Board of Trustees, New York Trade School, First Avenue and Sixty-seventh Street, New York, has plans for two and one-half story addition at 303 East Sixty-sixth Street, 200 x 225 ft., to cost about $500,000 with equipment. W. Miltenberger is architect for board; Robert F. Cutting is president.

Shell Eastern Petroleum Products Co., affiliated with Shell Union Oil Corporation, 65 Broadway, New York, and 141 Milk Street, Boston, has plans for four one-story units, a storage and distributing plant at Schenectady, N. Y., to cost about $100,000 with equipment. Jackson & Moreland, 31 St. James Avenue, Boston, are architects.

Shampan & Shampan, 188 Montague Street, Brooklyn, architects, have plans for a three-story automobile service, repair and garage building, 100 x 253 ft., to cost about $350,000 with equipment.

William C. Durant, 250 West Fifty-seventh Street, New York, formerly head of Durant Motors, Inc., and associates have organized American Cotton Picker Corporation, to establish a plant for manufacture of a cotton-picking machine, including parts and assembling departments.

Central Hudson Gas & Electric Co., 50 Market Street, Poughkeepsie, N. Y., has plans for two-story addition to generating plant on Dutchess Avenue, to cost over $85,000.

Albany Corrugated Container Corporation, Albany, N. Y., has leased about 40,000 sq. ft. floor space at Menands, near Albany, for establishment of main works. Present factory will be removed in October and additional machinery installed. C. C. Nuckols is president.

H. Baudler and P. Schneider, New York, have leased one-story building at Ninth Avenue and 207th Street, 100 x 100 ft., for an automobile body building and repair shop.

Excell Garage Co., 1227 Lexington Avenue, New York, has plans for four-story addition to automobile service, repair and garage building, to cost $100,000 with equipment. William Shary, 22 East Seventh Street, is architect and engineer.

Traveling ovens, power equipment, conveying and other machinery will be installed in four-story plant to be constructed by Gottfried Baking Co., Inc., 534 East Seventy-second Street, to cost about $400,000.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., will issue bonds for $3,200,000, and preferred stock for $701,200, proceeds to be used for new steam-operated electric generating plant at South Amboy, N. J., for which foundations are under way. It will be one story, 160 x 160 ft., and will cost $5,000,000 with transmission lines. Electric Management & Engineering Corporation, 57 William Street, New York, is engineer.

R. J. Letcher & Son, Fourth Avenue, Asbury Park, N. J., plumbing equipment and supplies, sheet metal work, etc., are planning new shop, including storage and distributing plant, 75 x 150 ft., to cost about $40,000 with equipment.

Bakelite Corporation, 247 Park Avenue, New York, manufacturer of insulating materials, hard composition rubber goods, etc., has engaged Franciso & Jacobus, 511 Fifth Avenue, architects and engineers, to prepare plans for plant at Bound Brook, N. J., to cost about $500,000 with equipment.

Hyvac Radio Tube Co., 36 Spring Street, Newark, has arranged for stock issue to total $427,500, part of proceeds to be used for expansion. Negotiations are being concluded for purchase of Lido Mfg. Co., Inc., 267 Douglass Street, Brooklyn, manufacturer of kindred specialties, which will be consolidated with organization.

Department of Institutions and Agencies, State Office Building, Trenton, N. J., is arranging for early construction of two-story power plant at Hillsdale State Hospital, Hillsdale, to cost about $50,000 with equipment. Guilbert & Betelle, 20 Branford Place, Newark, are architects.

Mayfair Service Station, Lake and Monroe Avenues, Asbury Park, N. J., operated by J. B. Davison and Zimel Resnick, has acquired site now occupied, 263 x 327 ft., and will have plans drawn soon for new automobile service, repair and garage building, with capacity of 1000 cars, to cost over $150,000.

Foster-Wheeler Corporation, 165 Broadway, New York, manufacturer of superheaters, centrifugal pumps and other power plant equipment, is carrying out an expansion and improvement program at plants at Carteret, N. J., and Dansville, N. Y.

Premier Foundry Co. has moved from North Bergen, N. J., to 316 Bergen Turnpike, Little Ferry, N. J. Company op-

erates non-ferrous foundry, 40 x 100 ft., and gray iron foundry, 25 x 100 ft. It also does plating.

New England

BOSTON, Sept. 23.—The machine tool market the past week was quiet. The most important sale was a Massachusetts made boring mill for delivery in 20 weeks. A feature of the market was the large number of quotations made on one, two and three tools. Inquiries indicate active fall business, virtually every inquiry received by dealers since Sept. 1 calling for equipment costing from $1,800 up.

The used tool market is lifeless. There is a fairly good demand for various types of shop equipment, but dealers are handicapped by the lack of supply.

New England aircraft builders and accessory makers are operating at capacity. One of the latest established plants in Lowell, Mass., a subsidiary of Moth Aircraft Corporation, is turning out six completed planes a week, and has reduced its employees 10 per cent the past month, due to the introduction of modern machinery. Reports from other small New England plants are encouraging, and production in the Hartford district has been so rapid that manufacturers are falling behind on deliveries. New England manufacturers are booked ahead until Jan. 1, and some well into the first quarter.

W. D. Bigelow, Amherst, Mass., is organizing a company to manufacture automobile jacks and airplane devices under firm name of Bigelow-Springfield Engineering & Mfg. Co., at Springfield, Mass.

Athol Mfg. Co., Athol, Mass., has awarded contract for an addition to its coating unit. Motors, drying ovens and miscellaneous equipment will be purchased.

Lever Brothers Co., Cambridge, Mass., soap manufacturer, has revised plans for a coal hopper.

C. B. Cottrell Co., Stonington, Conn., printing presses, has started work on a one-story and basement machine shop addition, 40 x 40 ft.

United Aircraft & Transport Co., Inc., East Hartford, Conn., closed bids Sept. 20 on a power house, 50 x 120 ft. Equipment will be placed later.

Whittall Associates, Worcester, Mass., has awarded general contract for power plant, to cost $500,000 with equipment.

Baird Machinery Co., 1700 Stratford Avenue, Stratford, Conn., will close bids Sept. 25 for a one-story plant, 120 x 180 ft., to cost $100,000 without machine tool requirements.

Plainville Casting Co., Plainville, Conn., has awarded general contract to Torrington Building Co., Torrington, Conn., for one-story foundry, to cost about $20,000 with equipment.

Pitney-Bowes Postage Meter Co., Stamford, Conn., manufacturer of postage affixing machines, parts, etc., has awarded general contract to E. & F. Construction Co., 94 Wells Street, Bridgeport, Conn., for two-story addition, 60 x 300 ft., including improvements in present factory, to cost about $85,000 with equipment. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, is architect and engineer.

Seymour Products Co., Seymour, Conn., and its affiliated organization, H. A. Matthews Mfg. Co., same place, manufacturers of pressed metal stampings, sheet steel products, etc., have acquired luggage hardware manufacturing division of Bassett Metal Goods Co., Shelton, Conn., and will consolidate. Bassett company will be operated as subsidiary, continuing present line of production.

Chance Vought Corporation, Long Island City, N. Y., manufacturer of aircraft, a unit of United Aircraft Transportation Co., New York, has taken bids on general contract for new plant at East Hartford, Conn., adjoining works under construction for Pratt & Whitney Aircraft Corporation, an affiliated organization. It will consist of one-story parts and assembling unit, 241 x 545 ft., with L-extension, 80 x 225 ft., and three-story and basement administration and engineering building, 51 x 185 ft., to cost over $1,000,000. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Welte Organ Co., recently organized to take over pipe organ division of Welte-Mignon Corporation, 665 Fifth Avenue, New York, has purchased former plant of Magazine Repeating Razor Co., Sound Beach, Conn., consisting of main one-story unit of 40,000 sq. ft. floor space. New owner will equip for manufacture of pipe organs and pipe organs mechanisms.

State Board of Finance, State House, Hartford, Conn., has plans for a power plant at Mansfield, Conn., to cost about $50,000 with equipment. Towner & Sellow, 363 Main Street, Middletown, Conn., are architects.

Philadelphia

PHILADELPHIA, Sept. 23.—Contract has been let by Philadelphia Electric Co., Tenth and Chestnut Streets, Philadelphia, to Truscon Steel Co. for one-story machine shop, to cost about $20,000 with equipment.

United Motors Service, Inc., 342 North Broad Street, Philadelphia, has asked bids on general contract for two-story service, repair and sales building, to cost about $150,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

William F. Ruwell, 719 Noble Street, Philadelphia, operating a machine shop, will remove to 493 North Orianna Street and install additional equipment.

Fayette R. Plumb, Inc., 4837 James Street, Philadelphia, manufacturer of tools, has awarded general contract to William F. Lotz, Oxford Bank Building, for one-story addition, to cost about $21,000 with equipment.

Acorn Metal Products Co., Philadelphia, recently organized by Louis D. Shiplee, has leased building at 819 North Lawrence Street, for establishment of a plant.

I. Fischman & Sons, Inc., Tenth Street and Allegheny Avenue, Philadelphia, manufacturer of soda fountain equipment, fixtures, etc., has awarded general contract to Turner Construction Co., 1700 Walnut Street, for two and three-story plant, to cost about $1,500,000 with machinery. Clarence E. Wunder, 1520 Locust Street, is architect. Fischman company has organized a subsidiary, Consolidated Marble Co., to represent Societe de Merbes Sprimont, Brussels, Belgium, and will establish marble-working plant.

National Machine Works, Inc., 210 Illinois Avenue, Atlantic City, N. J., has awarded contract to Charles D. Thompson, Pleasantville, N. J., for two-story machine shop to cost about $26,000 with equipment.

Nucar Forwarding Corporation, Whitehead Road, Trenton, N. J., manufacturer of motor trucks and trailers, parts, etc., is planning construction of new plant, to cost over $75,000 with equipment.

Metalcraft Products Co., Philadelphia, manufacturer of radiator covers, etc., has leased space in building at 414 Arch Street, for local works and headquarters.

Board of Education, Brookline, Pa., is considering installation of manual training equipment in two-story addition to high school, to cost $200,000, for which plans will be drawn by Boyd, Abel & Gugert, Otis Building, Philadelphia, architects.

Pittsburgh

PITTSBURGH, Sept. 23.—The machine tool business has been active the past week, largely due to purchases by the Westinghouse Electric & Mfg. Co. and the United States Aluminum Co. The latter company still has tools to close, but has now covered most of the requirements for its new machine shop at New Kensington, Pa. Equipment purchased recently by the Westinghouse company has been in addition to its regular third quarter list, most of which had been closed previously. This company will issue its fourth quarter list next week.

Railroad inquiry is still lacking in this district, but most of the roads coming into to Pittsburgh are expected to be heavy buyers this fall. General inquiry is good, but little buying is expected until after the machine tool show in Cleveland next week.

Orders for steel mill equipment continue to come to Pittsburgh builders. It is understood that the Illinois Steel Co. has placed the new blooming mill for its Gary expansion with the United Engineering & Foundry Co. The new "H" structural and universal mill which the blooming mill will serve will be built by the Mesta Machine Co.

Starlight Refining Co., Karns City, Pa., is said to be planning to rebuild oil refinery recently destroyed by fire.

Fokker Aircraft Corporation of America, Inc., Glendale, W. Va., has acquired a 30-acre tract at Alhambra, Cal., for a Pacific Coast plant, for which plans will be prepared at once, to cost $300,000 with equipment. Harris M. Hanshue is president.

City Council, Charleston, W. Va., has purchased about 200 acre tract at Institute, about six miles from city, for hangars, repair shops and other mechanical units, to cost more than $85,000 with equipment. Project will be carried out in cooperation with West Virginia Airways, Inc., recently formed by Harold B. Shadle, Edgewood Drive, Charleston, and associates.

General Electric Co., Erie, Pa., has plans for one-story addition to local plant, for production of alloy steel castings, to cost more than $60,000.

Firestone Tire & Rubber Co., Main Street, Akron, Ohio, has plans for a three-story factory branch, storage and distributing plant at Pittsburgh, to cost more than $200,000 with equipment, Lockwood Greene Engineers, Inc., Hanna Building, Cleveland, is architect and engineer.

Evans-Wallower Lead Co., Charleston, W. Va., is planning new electrolytic smelting plant at East St. Louis, Ill., to cost more than $500,000 with machinery. A plant for production of white lead is also being projected at Charleston, to

cost more than $200,000. Work on latter plant will probably be placed under way on completion of East St. Louis plant.

Buffalo

BUFFALO, Sept. 23.—Bids have been asked by Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks, for one-story addition, 100 x 250 ft., for parts production and service, to cost about $55,000 with equipment. North & Shelgren, Crosby Building, are architects. R. P. Lentz is treasurer.

Spicer Mfg. Co., Toledo, Ohio, manufacturer of automobile axles, universal joints, etc., is arranging for removal of plant of Salisbury Axle Co., Jamestown, N. Y., manufacturer of rear axles, recently acquired, to Toledo where it will be consolidated with differential department of purchasing company. A division devoted to front axle manufacture will be continued at Jamestown for time being.

National Paper Products Co., Carthage, N. Y., a subsidiary of Crown-Zellerbach Corporation, San Francisco, has acquired local mill of West End Paper Co. and will operate as branch. Plant will be converted for another line of paper production and extensions carried out, to cost over $75,000. E. B. Eddy is manager of National company, and will be in charge of new unit.

Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, has purchased 20 acre tract in Montana Land Tract, Los Angeles, for new Pacific Coast plant to manufacture airplanes. Initial works will include departments for parts production and assembling and will cost about $100,000 with equipment.

Doyle Gasoline & Oil Co., 336 State Street, Rochester, N. Y., is planning new storage and distributing plant on Sparrow Street Extension, to cost about $100,000 with equipment. Frank H. Falls, secretary and treasurer, is in charge.

Detroit

DETROIT, Sept. 23.—Timken-Detroit Axle Co., Clark Avenue, Detroit, has plans for two three-story additions, 75 x 120 ft., and one-story, 80 x 360 ft., to cost more than $150,000 with equipment.

Jaxon Steel Products Co., Chapin and Horton Streets, Jackson, has awarded a general contract to Austin Co. for addition to power plant, to cost about $40,000 with equipment.

Detroit Aircraft Corporation, Detroit, is planning extensions in landing field on Grosse Ile, to include construction of hangar, 120 x 140 ft., for seaplanes, with repair and reconditioning facilities. Company is arranging for large production of parts at local plant of Studebaker Co., recently leased. Plans are under way for plant on 30-acre tract at Long Beach, Cal., to cost more than $200,000 with equipment. E. S. Evans, head of Evans Auto-Loading Co., Union Trust Building, is president.

Board of Water and Electric Light Commissioners, City Hall, Lansing, is asking bids until Oct. 7 for equipment for extensions in Moores Park municipal power plant, including boilers, superheaters, stokers, economizers, ash hoppers, coal-handling equipment and other apparatus.

Michigan Bell Telephone Co., 1365 Cass Avenue, Detroit, has awarded general contract to Bryant & Detwiler, Union Trust Building, for seven-story equipment storage and distributing plant, including repair divisions, and automobile service, repair and garage unit, to cost about $1,000,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

City Council, Marine City, has arranged with a paper-manufacturing company, name temporarily withheld, to take over former local plant of Independent Sugar Co., for new mill. Structures will be remodeled and machinery installed at an early date.

Allied Motor Industries, Inc., operating American Cirrus Engines, Inc., 740 Washington Avenue, Belleville, N. J., and Great Lakes Aircraft Corporation, 16800 St. Clair Avenue, Cleveland, is making extensions and improvements in former automobile works of Wills-St. Claire Co., Marysville, Mich., including reconditioning for manufacture of aircraft engines and parts by American Cirrus division. Company will also build an addition to plant at Cleveland, primarily for production of twin-motored amphibians, to cost more than $75,000 with equipment.

White Star Refining Co., 903 West Grand Boulevard, Detroit, producer of refined oils, gasoline, etc., will soon take bids for two-story plant, to cost about $70,000 with equipment. Stratton & Hyde, Marquette Building, are architects.

The Crane Market

INQUIRY for overhead traveling cranes is rather limited and unless a considerable volume of buying develops in the next week, September is expected by most sellers to be a smaller month than either July or August. The Amtorg Trading Corporation has not yet closed on a 20-ton hand power crane for export to Russia. The Standard Oil Co. of New Jersey has purchased two 150-ton overhead cranes from an Illinois builder. Locomotive crane buying is small, but a number of orders are pending award, including two for the New York Central Railroad.

Recent overhead crane sales of H. D. Conkey & Co., Mendota, Ill., have included one 5-ton, 11-ft. 8-in. and one 2-ton, 8-ft. span single I-beam cranes to Nash Engineering Co., Norwalk, Conn.; 3-ton, 12-ft. span, single I-beam crane to Southern Indiana Gas & Electric Co., Evansville, Ind.; 6-ton, 26-ft. span, single I-beam crane to Gogan Machine Co., Cleveland; 2-ton special wall crane to St. Mary's Oil Engine Co., St. Charles, Mo.; 5-ton, 32-ft. 11-in. span, single I-beam crane to the Superior Tool Works, Chicago; 10-ton, 37-ft. 6-in. span, single I-beam crane to South Penn Oil Co., Madison, W. Va.; two 1-ton and one 2-ton, 37-ft. 6-in. spans and one 3-ton, 30-ft. span cranes to Bethlehem Shipbuilding Corporation, Baltimore; 1-ton, 29-ft. 9-in. span crane to Mechanics Universal Joint Co., Rockford, Ill.; 10-ton, 27-ft. 11-in. crane to Nekoosa Edwards Paper Co., Port Edwards, Wis.; 1½-ton crane to Missouri Pacific Railroad Co., Sedalia, Mo.; 3-ton crane to E. C. Holladay & Co., Ensley, Ala.; 2-ton crane to Harbison-Walker Refractories Co., Clearfield, Pa.; ½-ton transfer crane to International Harvester Co., Chicago; 5-ton, 3-motor, cab controlled crane to Standard Brake Shoe & Foundry Co., Pine Bluff, Ark.

Capacity of Silent Automatic Corporation, Detroit, will be increased five times on completion of new plant now under construction. Building will be seven stories, 100 x 120 ft.

Independent Pipe Co., Dearborn, Mich., is planning erection of a new factory to cost about $50,000.

Cincinnati

CINCINNATI, Sept. 23.—Manufacturers of machine tools in this district are maintaining capacity operations. Fresh bookings, however, are less that in the preceding week. The market, generally, is marking time, buyers waiting to appraise new equipment to be displayed at the coming machine tool show at Cleveland. Business placed was small and from scattered sources, the largest order being for two machines. Inquiry is fairly brisk, but is mostly for one or two machines at a time.

Wabash Portland Cement Co., Osborn, near Dayton, Ohio, has plans for a one-story addition, 60 x 340 ft., for kiln department and turbine room, to cost about $100,000 with equipment.

Exact Weight Scale Co., 265 West Spring Street, Columbus, Ohio, has asked bids on general contract for one-story plant, totaling about 35,000 sq. ft. floor space, to cost more than $65,000 with equipment. Carmichael & Milspaugh, 8 East Long Street, are architects.

William S. Merrell Co., Fifth and Pike Streets, Cincinnati, manufacturer of chemicals, etc., has plans for a two-story and basement plant, to cost about $450,000 with equipment. Tietig & Lee, 34 West Sixth Street, are architects.

Board of Education, Jackson, Ohio, is considering installation of manual training equipment in two-story high school to cost $240,000. Granville Scott, Citizens' Bank Building, Norwalk, Ohio, is architect.

Allen Mfg. Co., Nashville, Tenn., manufacturer of stoves, ranges, etc., is contemplating construction of new plant at Franklin, Tenn., to cost more than $200,000 with equipment. A site, 150 x 1200 ft., is under consideration. Kiwanis Club, Franklin, is interested in project.

Reynolds Metals Co., Thirtieth and Grand Streets, Louisville, will soon award contract for new plant on Camp Ground Road, near Louisville, to manufacture aluminum powder, etc., to cost about $100,000 with equipment. Arthur Tafel, 140 South Third Street, is architect.

Buckeye Cotton Oil Co., Gwynne Building, Cincinnati, a subsidiary of Procter & Gamble Co., same address, will soon begin work on three-story mill, 85 x 400 ft., at Memphis, Tenn., to cost about $200,000 with equipment. Robert & Co., Bona Allen Building, Atlanta, Ga., are architects and engineers.

Chicago

CHICAGO, Sept. 23.—Machine tool sales are widely scattered and possibly fewer than a week ago. The undercurrent of the market, however, is good and the feeling perists among dealers that October business will be good. Continental Motors Corporation, Muskegon, Mich., has placed some of the tools shown on its list. Bids have been sub-

mitted to the Pullman Co. but purchase orders have not yet been issued.

Recent scattered and small lot inquiry from manufacturers of farm machinery has given rise to reports of more extensive purchases to be made by this industry. However, one implement maker is said to have a surplus of standard tools as the result of recent installations of special machinery. Dealers are still on the hunt for good used machine tools, prices for which are relatively high.

Foster Bolt & Nut Mfg. Co., has plans for erection of another unit to its plant at 6300 West Sixty-fifth Street, Chicago. Foltz & Co., are architects.

H. D. Conkey & Co., manufacturers of the overhead traveling cranes and crawler cranes, are building an addition to their Mendota, Ill., plant which will double its capacity. Addition will be used for fabrication of materials only, and will be equipped with latest tools.

Peoria Casket Co., 209 Hamilton Street, Peoria, Ill., has plans for two-story addition to cost about $70,000 with equipment. Jameson & Harrison, Peoria Life Building, are architects.

P. J. Vollman, 5635 North Sacramento Avenue, Chicago, is considering one-story machine shop, to cost about $25,000 with equipment.

Norton Co., 11 North Jefferson Street, Chicago, manufacturer of grinding wheels and other abrasive materials, with main plant at Worcester, Mass., has plans for one-story factory branch and distributing plant, 120 x 240 ft., on site recently acquired in central manufacturing district, to cost about $90,000 with equipment. Mundie & Jensen, 39 South La Salle Street, are architects.

Monarch Aircraft Co., Rockford, Ill., is erecting one-story airplane manufacturing plant, 120 x 140 ft., near city limits, with departments for parts production and assembling, to cost about $75,000 with equipment. H. L. Millington is superintendent.

Peoples' Gas & Electric Co., Mason City, Iowa, has plans for one-story addition to local steam-operated electric power plant, with installation of 10,000 kw. turbo-generator unit and auxiliary equipment, to cost about $650,000 with equipment. Frank J. Hanlon is president and general manager.

Louden Machinery Co., Burlington, Iowa, manufacturer of conveying machinery, farm equipment, etc., has plans for one-story addition, 130 x 150 ft., to cost about $60,000 with equipment.

Inter-State Aviation Corporation, Chicago, care of Godfrey E. Larson, 5154 North Clark Street, architect, is planning establishment of new airport on 170-acre tract near Irving Park Boulevard. Two hangars, each 100 x 300 ft., with repair and reconditioning shops, and other field units, will be built, and for which plans are being completed. Company is also planning establishment of flying school. Entire project will cost about $200,000 with equipment.

C. H. Will Motors Corporation, 60 Eleventh Avenue, N. E., Minneapolis, Minn., manufacturer of commercial automobiles, parts, etc., has plans for one-story addition, to cost about $150,000 with equipment.

Eugene Dietzen Co., 166 West Monroe Street, Chicago, manufacturer of drawing instruments and supplies, has awarded general contract to T. P. Jorgenson, Chicago, for four-story and basement addition, 116 x 140 ft., to cost $250,000 with equipment. It will be used in part for storage and distribution. Albert S. Lowe is company engineer.

Cleveland

CLEVELAND, Sept. 23.—Machine tool inquiry, which has been light recently, improved the past week. The betterment is confined to Cleveland and immediate vicinity. A fair number of inquiries came out for one or two machines from scattered sources, mostly outside of the automotive field. Orders were light. Considerable business is being held up until after the machine tool show. The market in Detroit is unusually dull, as very little business is being placed by the automotive industry. Deliveries on most lines show little improvement.

Hill Clutch, Machine & Foundry Co., 6400 Breakwater Avenue, Cleveland, manufacturer of power transmission equipment, has plans for one-story addition, 50 x 90 ft., to cost about $35,000 with equipment. George S. Rider Co., Century Building, is architect and engineer.

City Machine & Tool Co., Toledo, Ohio, has purchased plant and business of S. M. Jones Co., manufacturer of forgings, etc., and will operate as a subsidiary. New company has been formed under name of City Forge Co., and expansion in output will be arranged. Amos Lint, head of parent organization, will be president of subsidiary.

Thompson Products, Inc., 2196 Clarkwood Road, Cleveland, manufacturer of valves, pistons, brake rod assemblies and other automotive products, has acquired property at West St. Catharines, Ont., for Canadian branch plant. Units will be one story, covering site, 546 x 1000 ft., and will cost more than $350,000 with equipment.

Fostoria Pressed Steel Corporation, Fostoria, Ohio, recently organized, will take over plant and business of Fostoria Pressed Steel Co., North Main Street, manufacturer of automobile fenders and kindred products. New organization has arranged for sale of stock to total $418,500, part of proceeds to be used for expansion. A new enameling plant has recently been completed and work is under way on additional one-story unit. C. D. Pifer is president of new organization.

Pennsylvania Railroad Co., Philadelphia, has awarded general contract to Albert M. Higley Co., Plymouth Building, Cleveland, for one-story machine shop, 35 x 75 ft., at Cleveland yards, to cost about $35,000 with equipment.

White Motor Co., East Seventieth Street and St. Clair Avenue, Cleveland, manufacturer of motor trucks, has awarded general contract to George A. Rutherford Co., 2725 Prospect Avenue, for one-story service, repair and sales building, to cost about $175,000 with equipment. Hadlow, Hughes, Hicks & Conrad, 806 Euclid Avenue, are architects.

Reliance Mfg. Co., Massillon, Ohio, manufacturer of lock nuts, washers, etc., will soon call for bids for one-story addition, to cost about $45,000 with equipment.

Danly Machine Specialties, Inc., Chicago, maker of standardized die sets, has opened warehouse and assembly plant at 1444 East Forty-ninth Street, Cleveland, in charge of J. R. Fitzsimmons. Complete stock of die sets and die makers' supplies is carried.

Milwaukee

MILWAUKEE, Sept. 23.—Operations of metal-working plants continue at the level established earlier in the year. There has been some recession in machine tool sales, although inquiries indicate that this let-up is only temporary, one cause of delay in closing orders being attributed to the desire of buyers to examine new equipment at the Cleveland show. Improvement in deliveries is slight and only on some of the smaller items.

Crucible Steel Casting Co., Milwaukee, is completing erection of two foundry additions, 31 x 81 ft. and 31 x 128 ft. A. C. Lange is president of company.

Filer & Stowell Co., 219 Becher Street, Milwaukee, manufacturer of sawmill and logging machinery, is erecting a new boiler house and coal bunker, two stories, 31 x 64 ft.

Line Material Co., South Milwaukee, manufacturer of metal and composition materials for electric transmission lines, will close bids shortly for new building, three stories, 60 x 120 ft.

Appleton Car Mover Co., 715 East Eldorado Street, manufacturer of devices for manual spotting of railroad cars, will build a two-story addition.

Fort Howard Paper Co., R. 7, Green Bay, Wis., has let contracts for a new warehouse and paper converting building, three stories, 100 x 200 ft., to Selmer Co., 310 West Walnut Street, local, and for boilers, stokers and superheaters to unnamed companies. It plans to erect a $75,000 bleaching plant, two stories, 65 x 125 ft. Austin E. Coffrin is president.

Wisconsin Axle Co., Oshkosh, Wis., is excavating for one-story, 100 x 200 ft., addition to machine shop, to cost about $100,000 with equipment. An addition to heat treating department is nearing completion.

South Atlantic

BALTIMORE, Sept. 23.—Bids will soon be asked on general contract by Levering Brothers, Inc., 200 Key Highway, Baltimore, manufacturer of sash weights, etc., for one and two-story branch plant at Hanover, Pa., to cost about $100,000 with equipment.

Julien P. Friez & Sons, Inc., 4 North Cathedral Street, Baltimore, manufacturer of scientific instruments, subsidiary of Consolidated Instrument Co. of America, Inc., New York, is contemplating new plant for manufacture of meteorological instruments and parts, to cost over $50,000 with equipment.

Water Department, Municipal Office Building, Baltimore, is planning call for bids in 30 to 60 days for new central pumping plant in Druid Hill Park section, to cost more than $450,000 with machinery. A smaller pumping plant is also planned to cost about $45,000. Edward G. Rost is engineer.

I. J. Marcuse, vice-president, Bedford Pulp & Paper Co., Mutual Building, Richmond, Va., and associates have organized Craig Hydro-Electric Corporation to construct a hydroelectric generating plant. It is understood that unit will be located near Bedford company mill at Big Island, Va. Mr. Marcuse is president of new organization.

A. L. Dorsey, Cleveland, Ga., is planning to purchase a rock crusher or stone pulverizer for local installation, to develop daily capacity of about 10 tons.

William Hellbach & Co., 409 Aisquith Street, Baltimore, plumbing equipment and supplies, are taking bids on general contract for two-story storage and distributing plant, to cost about $30,000 with pipe and fitting shop, etc. Kubitz & Koenig, Emerson Tower Building, are architects.

Standard Oil Co. of New Jersey, 26 Broadway, New York, has acquired property, 300 x 356 ft., at Asheville, N. C., as site for new storage and distributing plant, to cost about $200,000 with equipment. A similar plant is planned at Columbia, S. C., to cost about $300,000 with equipment.

City Council, Sumter, S. C., has leased tract about two miles from city for a municipal airport and will soon begin construction of hangars, repair shop and other mechanical units, to cost more than $60,000.

Union Bleachery, Inc., Greenville, S. C., plans construction of steam power plant for mill service to cost about $100,000, in connection with a general expansion program, entire project to cost about $350,000. J. E. Sirrine & Co., Greenville, are architects and engineers.

H. Harvey Warwick, 1116 Vermont Avenue, Washington, architect, has revised plans for three-story automobile service, repair and garage building, to cost about $100,000 with equipment.

B. F. Goodrich Co., Akron, Ohio, expects to ask bids on general contract in October for initial unit of automobile tire and tube mill at Atlanta, Ga., to cost about $250,000 with equipment. Entire plant will cost more than $1,000,000. McDonald & Co., Southeastern Trust Building, are engineers; and Robert S. Fiske, Healey Building, consulting engineer, both Atlanta.

W. M. Bassett Furniture Corporation, Martinsville, Va., is planning expansion to cost more than $250,000, including two two-story units, 100 x 140 ft. and 60 x 160 ft., for manufacturing.

Indiana

INDIANAPOLIS, Sept. 23.—Plans are under way by Fries Tool & Machine Works, Inc., 1918 East Wayne Street, Fort Wayne, for one-story addition, 35 x 125 ft., to cost about $50,000 with equipment. Guy Mahurin, Standard Building, is architect.

United States Corrugated Fibre Box Co., 1315 Martindale Avenue, Indianapolis, has awarded general contract to B. H. Bass, 1240 West Ray Street, for two-story mill, to cost about $200,000 with equipment. Charles E. Bacon, Odd Fellows Building, is architect.

Automotive Electric Co., Evansville, manufacturer of electrical equipment for automobiles, is planning to rebuild part of plant destroyed by fire Sept. 13.

Eaglesfield-Link Co., 1454 East Nineteenth Street, Indianapolis, manufacturer of woodworking machinery, parts, etc., has leased additional space at present location, making a total of 35,000 sq. ft. floor space, for increased output.

Evansville Malleable Castings Co., East Colm Street, Evansville, will soon call for bids for one-story foundry addition, 150 x 200 ft., to cost about $60,000 with equipment.

Arthur Chevrolet Aviation Motors Corporation, 410 West Tenth Street, Indianapolis, organized by Arthur Chevrolet, designer of automobile engines, and associates is arranging for new plant to manufacture an aircraft engine of special design, including departments for parts and assembling. Initial units will cost about $75,000 with equipment.

Charles R. Weatherhogg, 250 West Wayne Street, Fort Wayne, architect, has plans for one-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Gulf States

BIRMINGHAM, Sept. 23.—Following recent acquisition of Boykin Machinery & Supply Co., Beaumont, Tex., by International Derrick & Equipment Co., Columbus, Ohio, International Derrick & Equipment Co. of Texas, Inc., a subsidiary, has been formed to operate Boykin plant, devoted to manufacture of rotary drilling equipment and other oil-well machinery. Expansion is planned, including foundry for steel castings, machine shop and other buildings, to cost more than $85,000. Houston Galvanizing & Plating Co., Houston, Tex., another subsidiary of International company, has acquired 10-acre tract on local ship canal and plans construction of structural steel and iron works and galvanizing plant, to cost about $100,000.

Montevallo Coal Mining Co., American Trust Building, Birmingham, is carrying out expansion at coal-mining properties near Aldrich, Ala., including new haulage and mechanical-handling system, electric power equipment, etc., to cost about $60,000. Darius Thomas is head.

Huey & Philip Hardware Co., 1029 Elm Street, Dallas, Tex., will remodel a three-story building, 100 x 100 ft., for manufacturing, storage and distribution, to cost more than $50,000 with equipment. Lang & Witchell, American Exchange Bank Building, are architects.

Newport Co., South Milwaukee, industrial chemicals, etc., and Armstrong Cork Co., Twenty-fourth Street, Pittsburgh, have organized Armstrong-Newport Co., a joint subsidiary, to erect a mill near Pensacola, Fla., to manufacture insulating board under special process. Several units will be built, to cost over $750,000 with machinery. A. A. Schlesinger is president of subsidiary company.

Texas Co., 546 East Third Street, Jacksonville, Fla., has filed plans for one-story machine works, 60 x 80 ft., for oil tank and other equipment repairs, to cost about $22,000 with machinery.

Atlas Metal Works, Inc., Dallas, Tex., is building one-story plant at West Dallas, 200 x 210 ft., to cost about $100,000 with equipment.

Hidalgo Cotton Oil Co., Hidalgo, Tex., recently organized by Marvin and H. A. Evans, Hidalgo, has plans for a new cotton oil mill, to cost more than $45,000 with equipment.

City Council, Center, Tex., is considering installation of municipal electric light and power plant, to cost about $100,000 with equipment.

Greif Brothers Cooperage Co., 1937 Willey Avenue, Cleveland, has plans for two stave mills at Goodman and Balden, Miss., respectively, to operate under new mechanical system, each to cost more than $45,000 with equipment.

Mountain Lake Corporation, Mountain Lake, Lake Wales, Fla., plans installation of power and pumping machinery, with auxiliary equipment, for municipal water system, to cost more than $55,000 with equipment. Weideman & Singleton, Candler Building, Atlanta, Ga., are engineers.

Common Council, Seguin, Tex., is planning establishment of municipal airport, including hangar, repair shop and other field units, to cost more than $65,000.

Alabama Power Co., Birmingham, has acquired electric light and power plants of Alabama Water Service Co., at Fort Payne and Greensboro, Tex., and will consolidate. Extensions are planned, including transmission lines.

Dallas Airport Utilities Corporation, Dallas, Tex., is asking bids on general contract until Sept. 30 for construction of hangar, machine shop and administration building at Love Field, to cost over $60,000. Charles W. Davis is secretary and treasurer.

St. Louis

ST. LOUIS, Sept. 23.—General contract has been let by St. Louis Truck & Mfg. Co., 3200 North Hall Street, St. Louis, manufacturer of steel factory trucks, to Gillespie-Daly, Inc., International Life Building, for one-story addition, 60 x 120 ft., to cost about $45,000 with equipment. C. G. Schoelch, Syndicate Trust Building, is architect.

East Side Packing Co., 1214 North Second Street, East St. Louis, Ill., has plans for two three-story additions to meat-packing plant, 50 x 80 ft., and 40 x 60 ft., to cost about $65,000 with equipment.

Pet Milk Co., Arcade Building, St. Louis, has awarded general contract to Hug Construction Co., Highland, Ill., for one-story can factory addition at Neosho, Mo., to cost about $25,000 with equipment. Hirsch & Watson, Chemical Building, St. Louis, are architects.

Century Aircraft Co., 2525 Penn Way, Kansas City, Mo., will carry out expansion at airplane manufacturing plant, including installation of additional equipment. A stock issue of 100,000 shares has been arranged, part of fund to be used for purpose noted.

Board of Trustees, Creighton University, Twenty-fifth and California Streets, Omaha, Neb., has awarded general contract to Borchman & Sons, 4002 Lake Street, for new power plant, to cost about $140,000 with equipment. Leo A. Daly, Peters Trust Building, is architect.

Transcontinental Air Transport, Inc., Syndicate Trust Building, St. Louis, affiliated with Curtiss Flying Service, same address, with headquarters at 27 West Fifty-seventh Street, New York, has work under way on air terminal on Highway No. 3, East St. Louis, Ill., to include three hangars, 120 x 145 ft., repair shop, oil storage and other units, to cost more than $100,000. Kenneth Franzheim, 345 Madison Avenue, New York, is architect; Love-Sultan, Inc., 6625 Delmar Boulevard, St. Louis, is consulting engineer.

E. W. Tanner, Meyer Boulevard, Kansas City, Mo., architect, has plans for a three-story automobile service, repair and garage building, 100 x 150 ft., to cost about $130,000 with equipment.

Deere & Co., Moline, Ill., manufacturer of agricultural implements and machinery, have awarded general contract to George Plein, Sidney, Neb., for four-story factory branch and distributing plant at Sidney, to cost $80,000 with equipment.

Hesse Carriage Co., 311 East Seventeenth Street, Kansas City, Mo., has filed plans for two-story top addition to automobile body works, 85 x 100 ft., to cost about $45,000 with equipment.

Pacific Coast

SAN FRANCISCO, Sept. 19.—City Council, Santa Cruz, Cal., has plans for municipal airport near city limits, including two hangars, one-story repair and reconditioning shop, oil storage and other units, to cost more than $80,000 with equipment. Airport Engineering Corporation, Russ Building, San Francisco, is engineer.

Northrup Co., Los Angeles, manufacturer of aircraft and parts, has awarded general contract to Austin Co. of California, Inc., for one-story plant at United Airport, Burbank, to cost about $50,000 with equipment.

California Water Service Co., Port Costa, Cal., a subsidiary of Federal Water Service Corporation, 27 William Street, New York, plans installation of power and pumping machinery, filtering equipment, transmission lines, etc., for local reservoir, to cost $1,000,000 with equipment.

Aircraft Industries, Inc., Modesto, Cal., care of G. L. Bush, president, Bush Electric Co., San Francisco, recently organized by Mr. Bush and associates to manufacture aircraft and parts, is considering construction of one-story plant, to cost about $65,000 with equipment. E. R. Hawke, Modesto, will be an official of new organization.

Coast Specialty Co., 73 East Sixth Street, Portland, Ore., has purchased local property and plans new two-story factory to manufacture steel cabinets, tools and kindred products, to cost about $40,000 with equipment. Frank J. Stark is secretary and treasurer.

Pend O'reille Mines & Metals Co., Old National Bank Building, Spokane, Wash., has plans for construction of new zinc mill at Metaline Falls, Wash., with main one-story unit, 125 x 700 ft., power house, machine shop and auxiliary units, to cost about $1,000,000 with equipment.

W. B. Foshay Co., Minneapolis, Minn., operating electric light and power properties, has purchased plants and system of Dixie Power Co., Cedar City, Utah, operating in Washington and Iron Counties, with four hydroelectric power plants and transmission lines. Purchasing company will consolidate with organization and plans expansion, including transmission line to connect with other properties in Arizona, about 100 miles.

Officials of Joseph Kreutzer, Inc., Los Angeles, manufacturer of airplanes and parts, are organizing Kreutzer Aircraft Corporation, Inc., to take over and expand present company. Increase will be arranged in capital, part of proceeds to be used for developing additional plant facilities.

Raymond Foundry & Machine Shop, Raymond, Wash., has been bought by Lamb-Grays Harbor Co., having plants at Hoquiam and Aberdeen. Harris H. Wilt will be manager at Raymond.

Plant of North Bend Iron Works, North Bend, Ore., destroyed by fire Sept. 11, will be rebuilt at once.

Fir-Tex Insulating Board Co. will build a plant at St. Helens, Ore., to cost about $2,500,000. J. F. Shea Co., Portland, is general contractor.

Canada

TORONTO, Sept. 23.—While individual machine tool orders are confined to one, two or three tools to a customer, mostly for replacement, the total volume is large. There has been some improvement in demand for new works and dealers and builders report extensive orders for delivery before the end of the year. Inquiries are also appearing in good volume and several lists have been issued for new plant equipment. Small tools are moving freely, with large shipments to mining interests.

Trico Products Corporation, Bridgeburg, Ont., will call for bids at once for a new plant to cost $75,000. P. C. Cornell, 624 Elliott Street, Buffalo, is treasurer.

Hubbard Portable Oven Co. of Canada, Ltd., 1100 Queen Street West, Toronto, has purchased a site on King Street West, for erection of a plant.

Bids are being received by Smith, Hinchman & Grylls, 800 Marquette Building, Detroit, for addition to plant of Motor Products Corporation, of Canada, Walkerville, Ont., to cost $100,000.

A number of contracts have been awarded for erection of a $50,000 roundhouse at Windsor, Ont., for Canadian-Pacific Railway Co. Allan & Earl, Ltd., Equity Building, is general contractor.

International Harvester Co., has taken out a permit for erection of a forge plant at Hamilton, Ont., to cost $40,000. Engineering and construction work will be done by company's building department.

Riley Engineering & Supply Co., Toronto, has acquired a site at York Township, and will build a plant addition.

Bids will be called soon for a four-story addition at St. Jerome, Que., for Dominion Rubber Co., Ltd., 420 Lagauchetiere Street West, Montreal. De-Hueck & Co., Ltd., 620 Cathcart Street, Montreal, is engineer.

Western Canada

Sawmill of Beban & Mottishaw, Brechin Point, B. C., recently destroyed by fire, with a loss of $100,000, will be rebuilt and owners are interested in equipment for new mill.

Enamel & Heating Products Co., Ltd., Sackville, N. B., has taken over Albion Stove Works, Victoria, B. C. New owners plan enlargement and installation of additional machinery and tools. N. A. Hesler is managing director of Enamel & Heating Products Co. D. N. McDonald will be superintendent of Victoria plant.

Main building of new plant of Dominion Bridge Co. at Burnaby, B. C., will be 210 x 600 ft. A part of equipment will include four 25-ton, two 20-ton and one 10-ton electric traveling cranes. Five miles of railroad siding will be built.

Foreign

SITE has been purchased at Quimes, suburb of Buenos Aires, Argentina, by B. F. Goodrich Co., Akron, Ohio, manufacturer of automobile tires, for new plant to cost more than $400,000 with equipment. Paul R. Mahoney is executive vice-president.

Imperial Smelting Corporation, London, England, Sir R. Horne, chairman, is arranging for sale of 750,000 shares of stock, majority of proceeds to be used for plant expansion, with installation of equipment for substantial increase in present output.

Yale & Towne Mfg. Co., Stamford, Conn., manufacturer of locks, builders' hardware, hoists, etc., has purchased H. & T. Vaughan, Ltd., Willinhall, England, manufacturer of locks and other hardware products. Acquired interest will be operated as British subsidiary and expansion carried out.

Soviet Russian Government, Moscow, has approved plans for construction of irrigation system in Russian Turkestan and has engaged Arthur Powell Davis, formerly head of United States Reclamation Service, as chief engineer to supervise project. Work will be carried out over period of five years and will cost about 500,000,000 rubles (about $250,000,000). Water will be diverted from Amudaria and Sirdaria rivers, installation to include power and pumping machinery, pipe lines, trench-digging machinery, etc. It is said that large part of equipment will be purchased in United States. Amtorg Trading Corporation, 261 Fifth Avenue, New York, is official buying agency for Soviet Union.

Officials of Intercontinent Aviation, Inc., affiliated with Curtiss Aeroplane & Motor Co., Inc., Buffalo, both headed by C. M. Keys, have formed Compania Nacional Cubana de Aviation Curtiss, Ltd., to operate in Cuba. Large tract has been secured near Havana as site for airport, to include hangars, repair shops and other mechanical units. A cross-country and air-taxi service will be operated, as well as a flying school. Mr. Keys will head new organization.

New Trade Publications

Therapeutics of Electrical Equipment for Steel Mills.—Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Reprint 375. Systematic list for "trouble shooters"; draws witty parellel with doctoring human ailments.

Texrope Drive for Machine Tools.—Allis-Chalmers Mfg. Co., Milwaukee. A well illustrated 20-page catalog describes the Texrope drive for machine tools and shows many installations on various kinds of machines.

Diesel Engines.—Buckeye Machine Co., Lima, Ohio. Bulletin 505 of 24 pages illustrates and describes a 4-cycle vertical Diesel engine built for isolated plant use. This is made in three sizes with three, four and six cylinders, the range being from 200 to 400 hp., all at 277 r.p.m. Fuel consumption is stated at 0.40 to 0.41 lb. for each hphr.

Box-Header Boiler.—Combustion Engineering Corporation, New York. Folder of 4 pages, illustrated, showing a single-seam construction for box-header boilers, eliminating butt-straps and said to be stronger than previous construction.

Water-Wheels.—James Leffel & Co., Springfield, Ohio. Bulletin W206 of 6 pages illustrates and describes a vertical-shaft water-wheel as installed in a hydroelectric plant at Middleport, N. Y. The three units are of 1650 to 3000 hp. each. The company's line runs from 5 hp. to 10,000 hp.

Oil Burning Equipment.—Combustion

Engineering Corporation, 200 Madison Avenue, New York. Catalog of 8 pages illustrating and describing the Quinn oil burner for industrial use. It is of the steam atomization type and is made in five sizes, rated from 10 to 150 gal. an hour.

Industrial Building Heating.—American Blower Corporation, Detroit. Bulletin 7818 of 24 pages, illustrated, describes Venturafin unit heaters for use in industrial buildings. Details of construction are shown. Tables indicate steam consumption for definite results in heating different types of buildings.

Forced Draft Fans.—American Blower Corporation, Detroit. Bulletin 10401 of 12 pages, illustrated, is devoted to Sirocco forced draft fans for domestic and other small furnaces and boilers. It is claimed that the forced draft fans will permit use of cheaper grades of fuel without losing heating efficiency.

Light-Weight Insulating Concrete.—Federal Cement Tile Co., Chicago. A four-page folder describes the benefits accruing from the use of featherweight concrete insulating roof slabs. Essential data are set forth on the last page.

Squirrel-Cage Motors.—Wagner Electric Corporation, St. Louis. Seven types of squirrel-cage motors are discussed and compared in bulletin No. 165, consisting of 24 illustrated pages. One section of the bulletin describes cost, performance and delivery, another analyzes and compares the starting and running characteristics of the motors and other sections are devoted to information about construction, ventilation, lubrication and mechanical diversifications. The bulletin also contains a history of the development of double squirrel-cage motors, directed-draft ventilation and air-jacketed motors.

Rotary Positive Blowers.—Connersville Blower Co., Connersville, Ind. Bulletin No. 110 describes the R-S and R-B series of Connersville rotary positive blowers suitable for the medium range of air volumes and pressures. In addition to setting forth the general operating characteristics and some of the features of design, the bulletin contains revised ratings, based on improvements in blower construction, which permit higher operating speeds.

Exhaust Fans.—Duriron Co., Dayton, Ohio. Duriron exhaust fans for installation in laboratory hoods, pickling rooms and other places where it is necessary to remove corrosive fumes, are described in bulletin No. 158 of 12 pages. Many dimension drawings are shown.

Durimet.—Duriron Co., Dayton, Ohio. Bulletin A tells about the new steel alloy, Durimet, recently put on the market by the company. The alloy is designed primarily to resist the action of hot weak solutions of sulphuric acid.

Electrical Machinery.—Westinghouse Electric & Mfg. Co., East Pittsburgh. Leaflets 3746-E and 20355-A of four pages each illustrate and describe respectively a line of synchronous motor-generators and one of engine-driven a. c. synchronous generators. The motor-generators described are of 2-unit and 3-unit design and have 60, 25 and 50-cycle current. The synchronous generators illustrated are from 275 kva. to 938 kva.

The Week's News Quickly Told

Current Events That Bear on the Course of Business

DISARMAMENT projects occupied the headlines last week, what with negotiations between Great Britain and America on naval limitation, and consideration of land armaments by the League of Nations at Geneva. Anglo-American discussions on cruisers have developed to such a point that Prime Minister Ramsay MacDonald will arrive at Washington Oct. 4 to reach final agreement. An invitation will also be dispatched from London to four other naval powers to meet there next January and discuss the limitation of all classes of warships. Meanwhile five 5000-ton British cruisers and 53 United States destroyers will be decommissioned and sold for junk.

* * * * *

SENATORS investigating W. B. Shearer's activities at the last Geneva naval conference learn that he was employed only to "observe and report" to three ship building firms. Messrs. Schwab and Grace of the Bethlehem corporation both testified that a subordinate official acted in this matter without their knowledge and against their policy. Mr. Schwab said that he would like to see an arrangement made by which all battleships could be sunk and all munition work abolished.

* * * * *

TRADE continues throughout the country at a remarkably even state. Of 12 business barometers quoted by the Department of Commerce only three (bond prices, interest rates and "Fisher's index") are less favorable than a year ago. Employment level is above the seasonal rate, and retailers generally have confidence in a good volume of fall and winter business. It is estimted that the gross value of Southern crops is $250,000,000 higher than last year; cash income from farm products in the Minneapolis region this August was double that of last. Basic industries, with the exception of new building construction, are operating at higher than seasonal rates; margins of profit per unit are low, but large production gives generally satisfactory net income.

* * * * *

MERGERS, holding companies and investment trusts dominate the financial news. Four department stores (Bloomingdale, New York, Abraham & Straus, Brooklyn, Filene, Boston, and Lazarus, Columbus, Ohio) with annual sales totaling $106,000,000 are merged by the same investment house that recently combined Macy, New York, and Bamberger, Newark, into a unit with $125,000,000 sales . . . National City Bank by acquiring Corn Exchange Bank, becomes largest in the world, with $2,300,000,000 assets, and 201 branches in New York City . . . Marine Midland Corporation is formed to acquire a chain of banks in New York State with aggregate resources of $500,000,000.

* * * * *

POWER companies on the Pacific Coast are the field of activity for two large holding companies in that region . . . Niagara Hudson Power Corporation, a $450,000,000 Morgan promotion, has acquired land and islands along the Long Sault on the St. Lawrence river, a site capable of developing 2,400,000 horsepower, and figuring in recent New York and Canadian politics. T. W. Lamont, Morgan partner, denies any political motive, pledging the corporation to assist and cooperate with the State in the best interests of all concerned.

* * * * *

AERONAUTICAL Chamber of Commerce, in considering traffic possibilities, finds that income from air mail is about all that can be expected, and that real profits must come first from express handling and later, when the public acquires more confidence, from passenger fares. A resolution asking the Interstate Commerce Commission to regulate rates was rejected . . . C. A. Lindbergh inaugurates an extension of the air mail from Florida to South America by way of the West Indies . . . Rail-air service, Los Angeles to New York, was resumed after a 10-day interruption following the disaster in New Mexico.

* * * * *

WATERWAYS are responsible for a $600,000,000 annual saving in the nation's freight bill, according to Secretary of War Good. Discounting their effect on railroad prosperity, he prophesied an extension of National projects until a network of navigable waterways will connect every important American City.

* * * * *

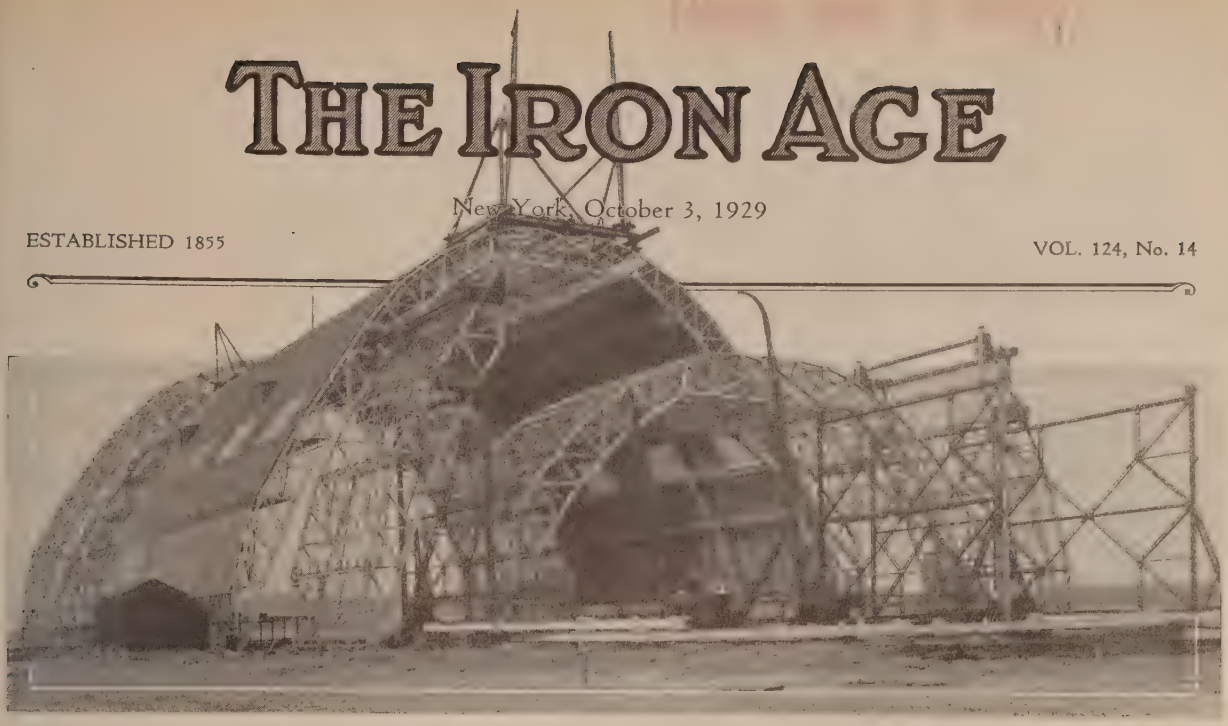
RAILROAD earnings are at a high rate, judging from the dividend at a 7 per cent rate declared by Baltimore & Ohio . . . Chicago, Burlington & Quincy will spend $5,000,000 for freight yard and terminal at Galesburg, Ill. . . . New York plans a new subway unit, 100 miles of three-track line, costing $500,000,000 for construction alone.

THE IRON AGE

New York, October 3, 1929

ESTABLISHED 1855

VOL. 124, No. 14



Huge Airship Factory and Dock Is Nearing Completion

PROPER conception of the magnitude of the Goodyear-Zeppelin Corporation's airship factory and dock now nearing completion at Akron, Ohio, is difficult to convey by pictures or even to acquire by a visit to the site, because the structure is set in a flat valley which has been graded exactly level for an area about a mile in diameter. Consequently there is no nearby structure of ordinary size which gives the scale of the construction.

The views show the skeleton about two-thirds completed; over-all dimensions are 1175 ft. long, 325 ft. wide, and 197.5 ft. high. The floor area is large enough for ten football gridirons.

The main structure consists of eleven three-hinged arches (with silicon steel main chords) set 80 ft. on centers. A unique method of erection was devised by the American Bridge Co.—haunches of a pair of arches are erected, the inner ends resting on temporary vertical bents, and all cross bracing attached. The central portion of this double arch is then erected in a low position, hoisted vertically to position with the aid of counterweights, and riveted fast. A traveller on the roof then erects the intermediate members.

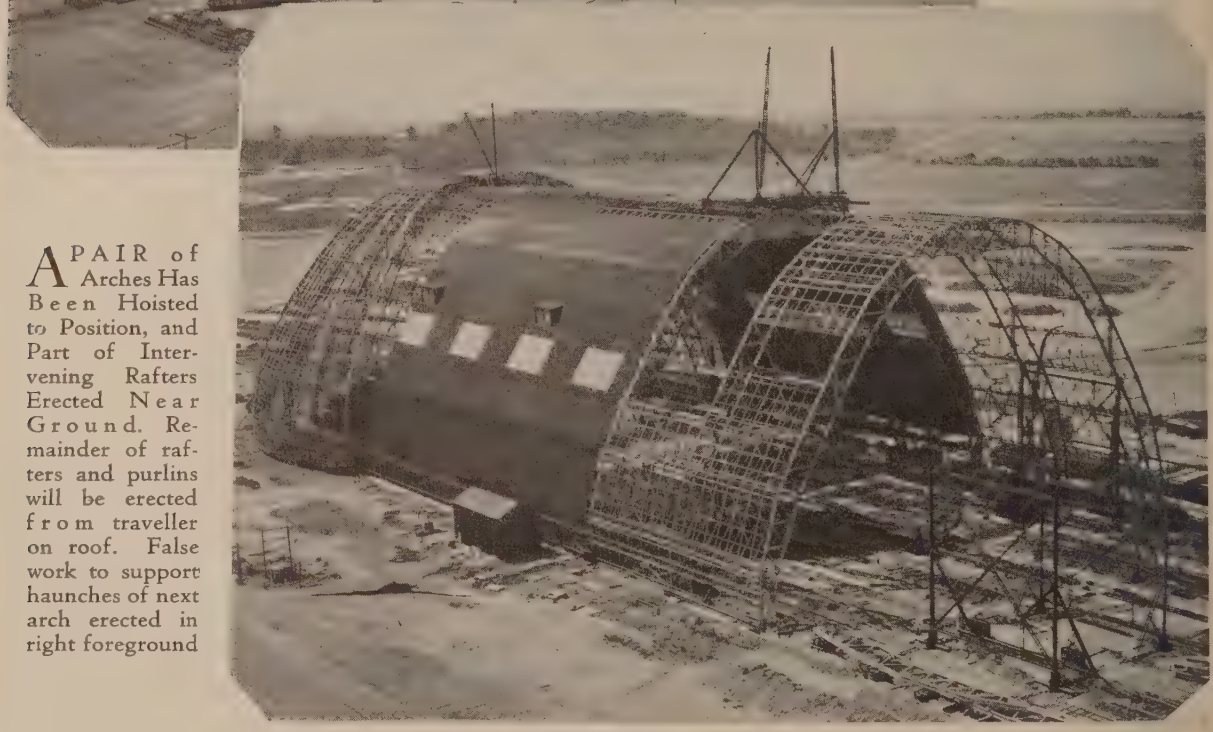
About 5350 tons of structural and silicon steel is required for the main shed. Four door leaves at the ends (made by the Detroit Steel Products Co.) require 1800 tons more. Physical properties are as follows:

	Structural Steel, Lb. per Sq. In.	Silicon Steel, Lb. per Sq. In.
Minimum yield point.....	30,000	45,000
Ultimate strength.....	55,000 to 65,000	80,000 to 95,000
Design Stress:		
Dead and snow load.....	18,000	24,000
Maximum from wind load..	24,000	32,000

Doors are shaped like segments of huge orange peel; they are hinged at the top to a 17-in. pin, 6 ft. long, set in a spherical joint 30-in. in diameter. At the bottom, each door rests on 40 forged steel wheels, separately journaled and sprung, rolling on a standard gage railroad track curved to a 187.7-ft. radius. Each door is opened and closed by a rack and pinion drive constructed by the Wellman-Seaver-Morgan Co. The rack consists of a 14-in. H-beam, bent to proper radius and built into the door near the base; teeth are 4-in. pins set 9 in. apart. Meshing into them is a bull gear with 22 teeth, connected to a 125-hp. General Electric motor by suitable worm gearing. Time limit relays, switches and controls are so arranged that a single push-button will close the doors in five minutes; deceleration at the end automatically occurs so the leaves creep together without bumping. Roof covering and siding is Robertson protected metal, with large corrugations fastened with special clips to resist stress in all directions.

Huge though this building is, it will house only one of the Navy airships to be constructed by Goodyear-Zeppelin Corporation. ZRS-4 and ZRS-5 are each to be 134 ft. diameter and 785 ft. long. Ample room is available at the sides of the structure for a row of shops and offices 42 ft. wide by 640 ft. long—a considerable manufacturing plant in itself. Longitudinal I-beams are attached to the lower chords of the main arches for 6-ton electric trolleys, to be used for erecting material into the airship structure or hoisting working platforms. Artificial light will be provided, all electrical equipment being carried in special gas-tight conduits and boxes, and all circuit breakers and fuses located outside the building.

STEEL Work for Spherical Doors Is Erected at This End. Doors are shown in the open position, rolled back past the end of the building, which has not yet been covered with corrugated metal



A PAIR of Arches Has Been Hoisted to Position, and Part of Intervening Rafters Erected Near Ground. Remainder of rafters and purlins will be erected from traveller on roof. False work to support haunches of next arch erected in right foreground

Underground storage for over 1,000,000 cu. ft. of helium gas at 750 lb. pressure will be provided in the form of about 100 pieces of 24-in. steel pipe, closed at both ends with forged heads, welded on, and with welded connections to an outlet manifold. Since each of the airships will require about 6,500,000 cu. ft. of gas each, a railroad siding is being installed alongside the gas handling plant, together with necessary piping, long enough for a dozen tank cars, each containing about 600,000 cu. ft. of helium under pressure.

Antiquity of Iron Discussed at Institute Meeting

T. A. RICKARD, the American mining journalist, contributed a discussion of the origin of iron smelting to the fall meeting of the (British) Iron and Steel Institute. He discounts the evidence of the piece of iron found imbedded in the Great Pyramid, built 2900 B. C., believing that the circumstantial account of its discovery is honest but mistaken. He bases his argument against such an early use of iron in industry by relics or inscriptions where iron is used or mentioned with gold as a precious metal.

Old poems or legends mentioning the use of iron, Mr. Rickard says, date from the author's time, which would be several centuries after the events he recounts. After considering all the evidence, Mr. Rickard concludes that the smelting of iron from its ores was commenced by the Hittites in what is now known as Anatolia, Asia Minor, some time after 1400 B. C. Previous to that time the only iron known was meteoric, which was very rare and costly.

Chrome-Nickel Stainless Alloys

Chemical and Physical Properties and Applications in Chemical Field—Chromium the Real Corrosion Resistant in Stainless Steels

BY T. HOLLAND NELSON*

MY two previous articles, [THE IRON AGE, April 25, page 1139, and May 30, page 1478] on the subject of stainless steel and chromium irons have each contained reference to the fact that I intended dealing with the nickel-chromium alloys in this field as a separate topic. I have done this in an attempt to avoid confusion and unfair comparisons.

Existing bibliographies are available for those who are interested in tracing the history of these alloys through the various patents and technical papers of a variety of inventors and authors on the subject. I shall, however, refer to only two of the outstanding metallurgists, who were undoubtedly pioneers in the development of these particular alloys. I refer to Dr. Benno Strauss, of the Krupp Laboratories, Essen, Germany, and to C. M. Johnson, of the Crucible Steel Co. of America. To their work and early patents on the subject much has since been added both by themselves and other workers.

The high alloys of chromium and nickel with iron had been a source of difficulty and worry to the metallurgist until comparatively recently. For a considerable time much trouble was experienced in producing material capable of being hot worked, although they were available in the cast form for heat-resisting purposes. Annealing presented quite a problem and of course machinability depended substantially upon the success of the annealing operation or the production of an alloy which did not require annealing to produce machinability.

Continued metallurgical study of these problems has finally enabled us to solve many of them and today we are able to establish definite ratios of chromium to nickel in iron with carbon, to produce material capable of being manufactured commercially into practically all the variety of shapes and sections which could be called for by the structural or chemical engineer.

*Consulting metallurgist, Widener Building, Philadelphia. In THE IRON AGE of April 25, Mr. Nelson discussed the basic questions of stainless steel and in the issue of May 30, various alloys of chromium and iron.

Patent Situation Outlined

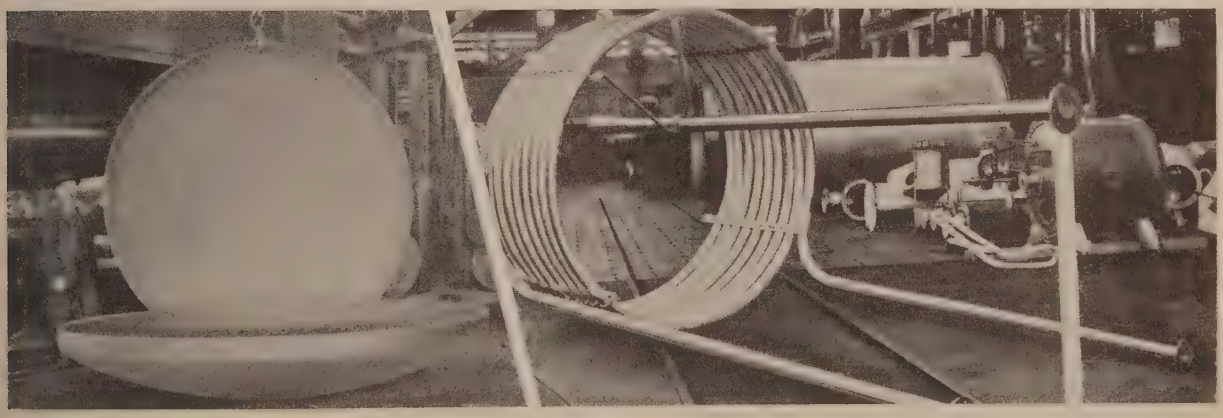
IN this particular alloy field, the patent situation is extremely regrettable. Chromium and nickel ranges have been allowed to overlap so hopelessly that an absolute disregard of any patents on the subject has resulted. The recent merging of various patents in the chrome-nickel series shows not only sound business common sense but holds out also the hope of wider development of the alloys themselves. There is within the scope of these various patents many alloy combinations of value not owned exclusively by any one patentee and therefore the trade has suffered as a result.

Within a short space of time I am convinced that we shall see a series of chrome-nickel alloys with varying proportions of nickel and chromium advocated unanimously by both patentee and licensee alike without the conflict of claims due to patent limitations.

Ratio of Nickel to Chromium

BEFORE the value of a definite ratio of nickel to chromium was established, many of these alloys were of such a type that they were martensitic, austenitic-martensitic, or entirely austenitic and, substantially as they existed through the hot working range, so were they not malleable, partially malleable or quite malleable.

In my first article I referred to a homogeneous structure as being the ideal for resistance to corrosion and,



COIL (Right) Made from Chrome-Iron Alloy (Courtesy of Enduro Committee). Flanged and dished heads (left) for tank or boiler construction. These can readily be made from either chrome-iron or chrome-nickel alloys. (Courtesy of Lukens Steel Co.)

so far as the chrome-nickel alloys are concerned, a homogeneous structure means not only ideal corrosion resistance but also reasonable malleability for hot-working operations such as forging, rolling, etc., and general fabrication.

Generally speaking, a material containing say from 16 to 18 per cent chromium requires from 9 to 11 per cent nickel present to render it entirely austenitic. Whereas if the chromium is raised say to 22 to 24 per cent then a nickel content of from 7 to 9 per cent would accomplish the same object. A material too low in nickel or chromium content would be correspondingly "red short," due to the fact that it would be unstable, partially martensitic and as a finished product difficult to machine and almost impossible to anneal.

Four Different Products

With this knowledge it is not difficult to understand that the rapid development which has taken place with the chrome-nickel alloys has been substantially with such alloys as are entirely austenitic—yet not too heavily alloyed to render them unnecessarily expensive.

modified to simpler design before they could be executed in straight chrome-iron.

Let us glance at the physical properties of a typical one of these alloys and review some of the outstanding features that such analysis modification brings about and then perhaps we shall more fully realize why the nickel-chrome alloys are to be regarded as a decidedly advantageous addition to the existing stainless steels and irons.

Chemical and Physical Properties of Chrome-Nickel Alloys

Chemical Analysis:		Per Cent
Carbon	under	0.07 or 0.15 as desired
Silicon	under	0.75
Manganese	under	0.50
Sulphur	under	0.025
Phosphorus	under	0.025
Nickel	from	8.00 to 10.00
Chromium	from	16.50 to 19.50
Physical Properties:		
(This is an austenitic material annealed by quenching)		
Tensile strength, lb. per. sq. in.		85,000 to 95,000
Yield point, lb. per sq. in.		30,000 to 40,000
Elongation in 2 in., per cent		55 to 60
Reduction of area, per cent		70 to 75
Brinell hardness		130 to 140
Izod impact (V notch)		100 to 120 ft. lb.

A TYPICAL Pickling Installation Showing Hydrochloric Acid Tank, Nitric Acid Tank and Spare Tank for Washing Off with Water. (Courtesy Lukens Steel Co.)

As evidence of this I have taken four popular brands and quote the manufacturer's analysis in each case. Incidentally it is amusing to note that each of them is operating under a different patent:

	No. 1 Per Cent	No. 2 Per Cent	No. 3 Per Cent	No. 4 Per Cent
Carbon	0.10 to 0.12	0.10 to 0.25	max. 0.20	max. 0.12
Silicon	0.75	1 to 3	max. 0.50	0.40 to 0.60
Chromium	17 to 19	17 to 19	17 to 20	18
Nickel	8 to 9	8 to 10	7 to 10	8 to 9

Where Is the Demand for Chrome-Nickel Alloys?

IT might be assumed that because the chromium-irons, previously dealt with in the other articles, have been adapted so readily to the chemical field there might be little demand for a similar material containing nickel, which obviously also increases the price.

However, experience with the stainless steels and chromium-irons in the building of chemical equipment brought to light many difficulties which were not easily surmounted. As for instance, due to the difficulty experienced in welding chromium-iron, large heating coils which called for tubes or pipe in one single length were extremely difficult to obtain. Many difficult bends and joints that could have been readily welded had to be

As stated above, just because many installations have been successfully built from chrome-iron, it does not necessarily follow that the chrome-irons were everything that could be desired. To date I know of not one single installation which has failed due to corrosive attack, but the fabrication was due entirely to close cooperation between the manufacturer of the material, the designing engineer and the fabricator and many modifications in design were necessary on account of the high physical properties of the material (particularly as induced by work hardening) restricted heating ranges, the difficulty of welding, etc., etc. Such modifications at times impaired general efficiency but were necessary, due to the material itself. Therefore any material a little more "fool-proof," more ductile, or with wider hot working ranges, either in the steel works or the fabricating shops, becomes immediately a welcome addition.

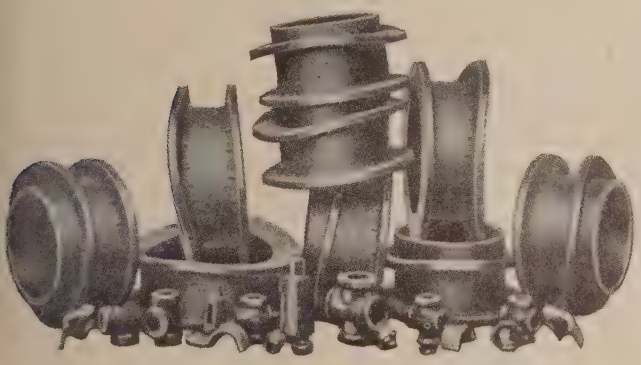
The nickel-chromium alloys offer us many of these improvements which in turn means that the designer can more nearly approach his true design. The wider temperature range makes it possible for both steel manufacturer and fabricator to form more complicated shapes the more readily and the absence of the serious grain growth which develops in the straight chromium-iron

at high temperatures, such as when welding, opens up the possibility of welded structures where welds for other reasons are not considered detrimental.

The Chromium-Iron Brittle Range

THE embrittlement of chromium-iron, due to prolonged heating in a temperature range between 850 and 1050 deg. Fahr., which caused considerable trouble in the oil industry, for a while, was responsible for the manufacturers of seamless tubes welcoming the advent of the chromium-nickel alloys, which so far apparently have shown no tendency to develop this phenomenon. Various reasons have been offered as an explanation to account for this brittleness, all of which, to the author's mind, are still inconclusive. Nor am I satisfied that a similar condition will not develop in some of the chrome-nickel alloys under certain atmospheric conditions although it may be in a less dangerous range and over a much longer time cycle.

Some of these alloys are yet so close to an unstable compound that elevated temperatures are apt to show striking results. These remarks are not made as a pessimist but because the author, in handling these stainless



Castings, Typical of the Kind Produced from Chrome and Nickel-Chrome Alloys

alloys since their birth, has seen childish and unwarranted optimism lead to disappointing and serious results. Coming from the original school of stainless steel, and following through the development of chromium-iron and having been associated in some capacity with practically all the large installations in the country has naturally brought to my attention many limitations of the straight chromium-alloys. I would unhesitatingly state, however, that, while welcoming the development of the chrome-nickel alloys, they cannot be regarded as a cure-all and every care should be used in their selection.

A very popular combination before us at the moment is that known as the "18 and 8 type," signifying 18 per cent chromium with 8 per cent nickel. The typical analysis and physical properties of this material are to be found in the preceding table. The low elastic limit, together with such high ductility as exhibited in the elongation, reduction of area, impact and Brinell, clearly explain how readily this metal can be cold worked. Articles of extremely intricate design can be formed and fashioned from this alloy which it would be impossible to produce in a straight chrome material.

Like all other metals these alloys become harder with continued cold work, which of course is reflected in an increase in the tensile strength and elastic limit, with a corresponding reduction in the elongation and reduction of area. A simple heat treatment, i.e., rapidly heating to 1900-2000 deg. Fahr. and either air cooling or

Fireplace Made from Chrome-Nickel Alloy

quenching according to section, will restore the original ductility of the annealed material.

A Personal View Regarding Nickel Content

THE author can perhaps make his own view still more clear (and incidentally leave himself open to serious criticism) by stating frankly that, in practically all these alloys, it is the *chromium* which gives the metal its corrosion-resistant properties. Undeniably the nickel additions are valuable more particularly in regard to their bearing upon the physical properties, which are of course reflected in easy fabrication.

If my view regarding the chromium is incorrect, then show me one of the commercial chrome-nickel alloys which does not contain more than the minimum chromium content stipulated by Brearley* as being required to produce a stainless or corrosion-resistant alloy. Further I would refer to the work of Pilling and Ackerman in an excellent paper on the subject of iron-nickel-chromium alloys wherein they state:

> The solubility in nitric acid of sufficient dilution to afford rapid rates of corrosion may be affected by changes in content of nickel, chromium or iron, yet the point at which substantial passivity is reached depends practically wholly on the chromium content independent of nickel or iron.

Inasmuch as I have made very definite claims regarding the value of chromium and its effect on the re-

**Mining and Metallurgy*, Feb., 1929.

Dinner Ware Made from Chrome-Nickel Alloy

sistance to corrosion, it should be clearly understood that I am aware of high-nickel-silicon alloys with and without small quantities of chromium; also the nickel-molybdenum alloys, which show remarkable resistance to sulphuric and hydrochloric acid. These are beyond the scope of this article and enter a different field from that covered by the alloys of chromium and nickel-chromium so far dealt with by the author, for which no claims have been made with regard to resistance to hydrochloric and sulphuric acids. I believe much will be heard of these new alloys in the near future and they too will be welcomed by the chemical engineer.

General Working Instructions

FORGING.—The chrome-nickel alloys available today of the "18 and 8" or similar type can be forged or rolled from a temperature of approximately 2200 deg. Fahr. down to about 1700 deg. Fahr. without difficulty. Working below this temperature is difficult and has a tendency to rupture if not crack and burst the material. Slow heating to approximately 1500 deg. Fahr. and then more rapid heating to maximum temperature is advised.

ANNEALING.—Being an austenitic alloy, the softest condition is obtained by heating the material to a temperature of from 1900-2100 deg. Fahr., according to modifications in analysis, and cooling as rapidly as possible. Air cooling on thin section is sufficient, but more massive sections would require quenching.

PICKLING.—It should be unnecessary to explain that the scale produced by any hot-working operation must be removed before any of these alloys can be considered in the best condition to resist rust or corrosion. The reason for this is explained in my first article.

The method of pickling the chrome-nickel alloys is substantially the same as that adopted with the straight chrome-irons and steels, except that sand blasting is not recommended to accelerate pickling, due to the fact that the material is so soft that the particles of sand readily become embedded in it. The general practice is to place the heat-treated material in a solution of hydrochloric acid, 20 to 40 per cent acid, to which sometimes a smaller percentage of nitric acid is added, allow it to remain until the scale is removed, wash with water and immerse in a solution of nitric acid, 10 to 20 per cent in water, with a final wash off in clear water. The temperature of the hydrochloric acid bath can be raised with advantage to approximately 180 to 200 deg. Fahr. and the material has a tendency to show a somewhat whiter surface if the subsequent immersions in nitric acid and final washing in water are also done hot. A typical pickling installation is shown in one illustration.

CASTINGS.—One sometimes despairs of the possibility of obtaining perfect castings in this type of alloy. The shrinkage of this material is approximately 9/32 in. compared to 1/8 in. in the case of cast iron. The rapidity with which the metal solidifies and the difficulty of convincing the ultimate user that he cannot get castings usually of the same low carbon content as the wrought material are but a few of the difficulties with which the alloy foundry is confronted.

There is no denying the fact that the nickel-chromium alloys are much more popular in the foundry than the straight chromium and today we are able to obtain, in either chromium or chrome-nickel, all types of fittings, manhole frames, nozzles, etc., such as are illustrated. Producing bars, sheets, plates, etc., is one thing. To produce a finished article in the cast form is another.

Alloy Foundry's Problems Today

THE problems before the present-day alloy foundry are largely due to the fact that, when an engineer picks a material to build his equipment from, he will expect to obtain that same material throughout his job, even to the cast parts. The result is that alloy foundries receive orders from time to time calling for castings from such and such a brand of material, which is advertised to a chemical specification practically impossible to produce in the cast form.

A foundry has its own problems to deal with and the wise buyer will have his castings made by a reliable house from a material of substantially the same analysis as that the rest of the equipment is to be built from, but leaving the foundry to make such modifications as may be necessary to produce sound clean castings capable of being machined.

Because there are 15 or 20 different trade names for materials with but slight variance in chemical analysis, there is no reason why there should be the same number of casting analyses, which has led in many cases to castings which on one hand were sound and not machinable, and on the other, material which was machinable but not sound. In the chrome-nickel alloy range, the foundryman needs his latitude, or working margin of safety, if you care to call it such. So that if you send a plate or bar specification to a foundry for castings do not be surprised if the intelligent foundryman declines to quote.

It is not easy to produce a perfectly satisfactory surface on a casting. Pickling is resorted to just as on the wrought material but the surface inundations and imperfections on such a rough surface have a tendency to hold small particles of foreign matter. In the early stages these small imperfections or inclusions will rust and stain quite a considerable area, but, as they are soluble, in service under corrosive conditions they are gradually eliminated. It is almost impossible to obtain a finished pickled casting which will not show some rust spots on it.

Some Concluding Thoughts

IN concluding this article may I again say that the development in the chrome-nickel alloys is extremely welcome to manufacturer, fabricator and user alike, inasmuch as they have opened up a wider field of application for corrosion-resistant alloys, due to their easier fabricating qualities.

May I, however, again reiterate that due regard should be paid to the chromium content of any alloy which is to be used to combat corrosion (hydrochloric and sulphuric acids excepted) for I am firmly convinced that chromium is the weapon with which we fight corrosion, and nickel, the friend that comes to our rescue when certain alloys have not the physical properties which we may possibly desire.

Finally, I have been asked repeatedly—is "18 and 8" the last word in this type of alloy? I am frank to say that I believe it is nearer the first word and that the future will see us using straight chrome and a series of chrome-nickel and nickel with silicon or chromium or other alloys, each dealing with separate problems.

Principle Established by Brearley

I firmly believe that Brearley established a principle which will carry on for all time. That principle was this, that "a certain percentage of chromium in iron renders that iron-chromium combination insoluble under certain conditions." So shall we find other alloy combinations and shall probably again modify and adjust them to meet the demands of the fabricator, for this is true progress.

My next article will be on heat resistant alloys, which I regard as a question of corrosion by atmospheres or by-products at elevated temperatures, in which chrome-nickel and nickel-chrome alloys in entirely different ratios play an important part.

Keeps Production Costs Down

By Closely Regulating Movement of Stock Through Manufacturing Departments, Studebaker Corporation Lowers Expenses

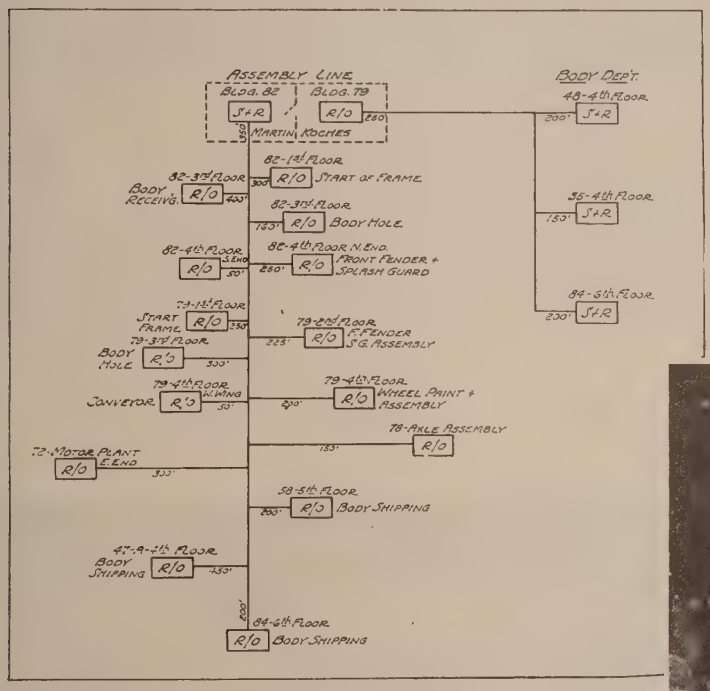
ONE of the statements most frequently heard nowadays is that "in buying an automobile one gets one's money's worth." This opinion has developed as a result of a general downward revision of prices within the automobile industry, and in most cases reductions have been made possible by the inauguration of manufacturing economies. To keep costs at a minimum figure in a plant capable of turning out 600 cars a day is the task which faced the management of the Studebaker Corporation at South Bend, Ind. How this is done is described in the following paragraphs.

Appropriations for manufacturing purposes originate in the finance committee, which is composed of officers and members of the board of directors. After an appropriation has been made, the sales department makes up a car schedule for the next three months, staying, of course, within the limits of the appropriation. The car schedule, when transmitted from the sales department to the manufacturing division, constitutes the latter's authority to purchase materials and to make sufficient parts to supply the assembly lines for 90 days.

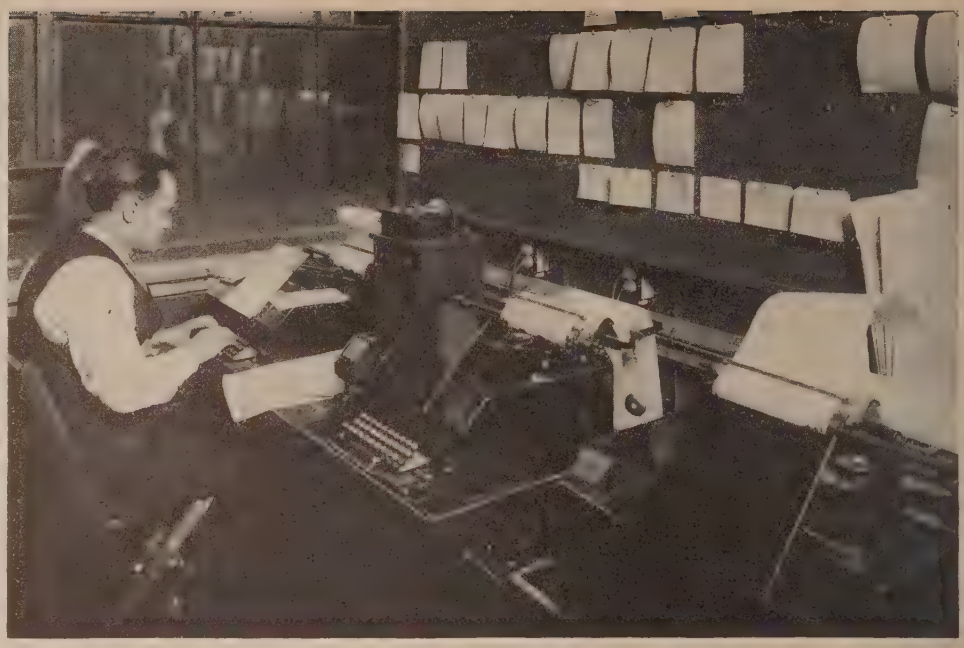
While some parts going into Studebaker automobiles are bought from outside sources, most of the major parts are manufactured by the company. In this connection the fact is obvious that there must be a well-defined method of scheduling production of parts to conform to the needs of the assembly lines. This is done by adhering to the following plan.

Each part has its own "bank," or reserve stock, to feed the main assembly lines. The size of the bank is determined by a number of shop schedule clerks who study plant operations and set the proper "bank" for every part.

As a protection against sudden development of a shortage of material, a six-days' supply of each part is



COMMUNICATION Between Various Production Departments and the Final Assembly Lines Is Maintained by Means of a Telephone Typewriter System Shown in the Diagram (Left). R/O indicates a "receiving only" instrument, S/O a sending instrument and S+R a sending and receiving machine. The photograph below shows a department head receiving a message from the final assembly department

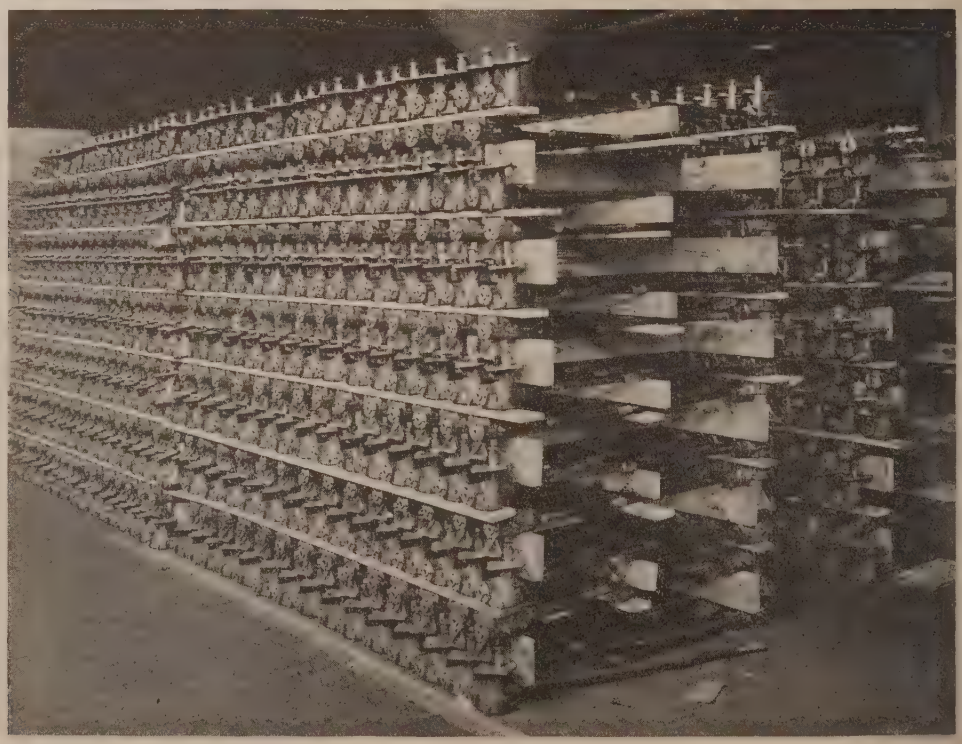


THE Typewriter Being Used Is the Master Machine in the Production Superintendent's Office, Which Is Sending Messages to the 15 Telephone Typewriters Along the Assembly Line. In the center is the emergency machine and at the right the machine which receives messages from the body department. The cards on the hooks are foreign orders

kept in stock, where it is not used except in an emergency. The storekeeper maintains a daily tab on stocks, and if he finds it necessary to go into the reserve supply for material for current production needs, he immediately sends an individual shortage report to the purchasing department, notifying it that the amount of stock has dropped below the danger line. When fresh material is received at the stockroom, the storekeeper brings the reserve supply for that part up again to the proper level and puts the remainder in stock for current use.

This plan has practically eliminated possibility of suddenly exhausting the supply of any part and thereby holding up work along assembly lines. It also serves as a perpetual inventory of reserve stock. It is applied not only to parts bought from outside sources, but also to those made by the company. In either case an individual shortage notice is equivalent to a rush order for a part required by the production division.

The purchasing department is responsible for getting prices from and placing orders with vendors and for delivery of materials at the specified time. In this respect it is just as important to prevent a surplus of stock from accumulating as it is to assure a proper supply. When material is delivered by vendors, it is checked and weighed in by the receiving department and a report is made to the production records department. Each department manufacturing parts maintains an accurate check of its output by having all finished parts pass



AS a Protection Against Sudden Shortage of Material, a Six-Days' Supply of Each Part Is Kept in Stock, Where It Is Not Used Except in an Emergency

through a clearing house station at final inspection before they leave the department. Here they are counted by a clerk and the production records department is supplied with the information. In this manner the production records department has in its possession at all times data upon which to base shop operations.

Every Department Has Stockroom

Each department has a stockroom in charge of a storekeeper, who has before him a copy of the daily schedule for assembly lines. Material is released from the stockroom according to this schedule. If the foreman of a department along the assembly lines finds that he must have additional stock, the storekeeper gives him the extra amount, but charges it against him as loss of stock. The precaution exercised in releasing stock has prevented waste on the part of production departments and has acted as a guard against shortage.

Once a year an inventory of raw and finished stock is taken. Storekeepers count the stock in storage, and clearing house clerks in departments producing parts tabulate the stock on the floor. Throughout the year the production records department compares its stock records with actual stock conditions as reported by storekeepers. If too great a discrepancy exists, a special inventory of the part in question is ordered.

If the use of a part is discontinued or, if a part is superseded by a new part, the production records department ascertains from its files the number of parts on hand. An attempt is made to make the change at a point when the supply of the old part is exhausted, but this is not always possible. If the change is such a decided improvement that the management thinks it advisable to substitute the new part as soon as possible, the cost of the old part and the quantity on hand are considered, and a decision is made in regard to scrapping the old part immediately.

When a new model of automobile is to be put on the market, invariably material for the old model is left over. A list of this stock is made up and given to the service department, which takes the quantity it wants. The remainder is sent to the salvage department, where it is kept until the new model is actually in production. It then is sold as scrap.

Foreman Furnished Production Sheet Monthly

Every month foremen are furnished with a parts production schedule sheet showing the number of parts needed that month and the daily requirements. Since there are usually a multitude of parts going through a department, it is sometimes difficult for a foreman to keep track of his standing. Consequently the production records department draws on the parts production schedule sheet a red line on the date up to which the quota for each part for that month has been manufactured. If the red line for any part has fallen behind the current date, the foreman knows that he is short of his quota and must concentrate on bringing his production of that part up to date. This simplified system helps the foreman to visualize in a moment the position of his department in relation to production needs.

It has already been stated that clearing house clerks count the number of parts going out from operating departments. This information is recorded on transfer tickets, which are sent at the end of each day to the production records department. Night clerks are employed to transfer the accumulated data to the shop schedule record, a copy of which is put in the hands of every foreman when he reports for duty at seven o'clock the following morning. Thus he has before him at the beginning of the day the results of the previous day's activities and of the month to date, and is in a position to determine what work is immediately ahead of him.

AN Accurate Check of Finished Parts Is Made by a Clerk at a Clearing House Station at Final Inspection Before They Leave the Department in Which They Have Been Manufactured

All of the executives of the company receive daily from the production records department a "current car production and shipment report," which lists the various Studebaker models and sets forth in parallel columns the schedule, production and shipments for the previous day and for the month to date. In a separate column is recorded the number of automobiles over or under the production schedule to date. At the extreme right of the sheet is the number of finished automobiles on hand for shipment to dealers.

Telephone Typewriter System Installed

Communication between various production departments and final assembly lines is maintained by means of a telephone typewriter system, which is the largest installation of its kind in the United States. It consists of 22 machines installed at a cost of approximately $18,000 and has been in operation since March 1. There are two groups of machines, one group comprising three machines in the body department, which send and also make a copy of what is being transmitted, connected with one receiving machine in the office of the production superintendent. In case one of the machines is in operation, a red light shows on the other two, indicating that the circuit is in use. A white light is the "go ahead" signal. This part of the system keeps the final assembly lines informed of bodies under construction and ready for delivery.

The other group consists of a sending and receiving machine (this machine also makes a copy of what is being

sent) in the office of the foreman in charge of final assembly, connected with 15 receiving machines located at different points along the assembly lines. One emergency typewriter is connected and ready to operate in case anything should go wrong with the machine in the foreman's office. Another is ready to replace any of the 15 typewriters which might develop serious trouble. All of the machines along the assembly lines receive messages from the sending instrument simultaneously.

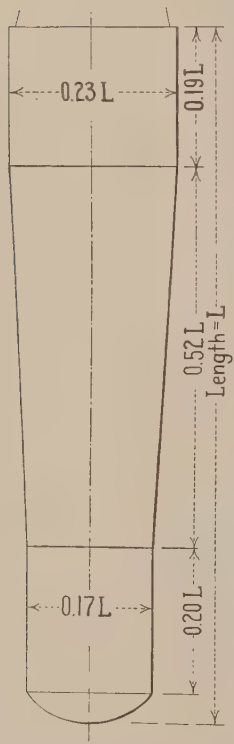
Back of the system is the idea of coordination, which does away with unnecessary delays in final assembly of Studebaker automobiles. With this method of communication between departments, everyone is kept informed of the different types of cars to be assembled, supervisors thus being enabled to have on hand in their departments all parts essential to keep assembly lines moving on normal schedules.

In place of mimeographed copies of orders formerly delivered by messengers, instructions now are typed on sending machines. Messages are received in typewritten form on page-size paper, and four copies can be made.

Installation of a conference telephone system of 13 stations was completed recently. Although it is not a direct part of the telephone typewriter service, it supplements it. The system provides for hooking up the entire group of stations so that in reality a conference is held over the telephone without the necessity of department heads leaving their offices. In case anything should go wrong with the typewriters (and, with two emergency machines and experts within call, such a situation is not probable), the telephone conference system could be brought into use as an emergency measure.

The telephone typewriter system has proved of great benefit and is a vital factor in a program of increased production brought about by the concentration of all Studebaker production at South Bend.

Casting Practice to Insure Uniformity in High Carbon Steel



Outline of Ingot, Designed, To Mitigate Segregation in High Carbon Steel

AN extended study of the ingot structure for 1.10 per cent carbon steels was reported by Axel Hultgren of Soderfors, Sweden, to the fall meeting of the (British) Iron and Steel Institute. Ingots weighing 1000 lb. and less, cast big end up and with hot top, were sectioned and etched. When teeming moderately hot steel the sectioned ingot showed the usual structure—a skin of fine crystals, a zone of columnar crystals and a center of large dendrites.

Certain blocks of steel were sawed into thin sections and the continuity of crystals traced from one to another, and indicated that these primary crystals are much larger than indicated in a single section; crystals interlock and interpenetrate; the main stems may also become bent and change the direction of the markings. Dark areas among large crystals shown on etched surfaces are crystalline planes approximately parallel to the etching plane.

In general, the direction of crystalline growth is perpendicular to the isothermal surfaces in the cooling ingot, so the columnar crystals generally curve upward. Low carbon or alloy steels which solidify mainly as delta iron develop a secondary crystalline structure when they transform to austenite; this secondary system is related only distantly to the primary dendrites.

The coarse dendritic crystallization may be suppressed by "after pouring" at the correct time and temperature, by stirring the partly solidified ingot, or by teeming very cool. Such fine grained ingots of 1.10 per cent steel all had a low carbon axis (about 0.97 per cent carbon) and a high carbon top. In one experiment the ingot mold was set on a turntable, and during solidification the mold was oscillated back and forth through a short arc, each reversal being sudden. This produced an ingot with an outer columnar shell about 1½ in. thick with normal carbon, and a very sharp transition to small random crystals; at this plane the carbon analyzed 1.36 per cent.

Analysis of Exuded Drops

Analysis of exuded drops showed the degree of "segregation on a small scale" to be as follows:

	Analysis of Heat	Analysis of Exuded Drop
Carbon	1.10	1.87
Silicon	0.26	0.33
Manganese	0.30	0.46
Phosphorus	0.015	0.029
Sulphur	0.006	0.019

This is a measure of the differences in analysis of the cores of the dendrites and the mother liquor trapped between their branches (much of this segregation is later diffused). Arrow-headed and V segregation "on a large scale" is thought by Mr. Hultgren to represent channels through which such enriched mother liquor has been sucked to feed shrinkage.

From theoretical considerations, the ingot contour illustrated was developed which practically eliminated these "segregations on a large scale," very prominent in slightly tapered ingots. The tendency for segregation is mainly a function of the difference in temperature between beginning and end of solidification, and consequently each grade of steel should be cast in a mold of correct taper for that grade.

Discussion by Dr. Hatfield

In discussion Dr. W. H. Hatfield said there was nothing in the paper which was contrary to the findings of the Institute's Ingot Committee. It would appear that the author had not given sufficient weight to that evidence. Dr. Hatfield challenged the statement which was sometimes made, although not by Mr. Hultgren, that the ingot commitee had largely confined its publications to the statement of what was to be observed in current practice, and had not contributed substantially to a complete solution of the troubles of the manufacturer. The author seemed to deal only with small ingots.

Prof. J. H. Andrew suggested that if the author wished to study segregation as known in Great Britain he must obtain his ingots from a country other than his own, for he seemed to have very little segregation in his ingots of high carbon steel.

Making Machine Tools Safe

Adequate Protection Should Be Given at the Cutting Point, the Most Dangerous and the Most Difficult of All to Guard

BY LUTHER D. BURLINGAME*

THE seven seals of safety mark the vital steps by which the safeguarding of machine tools has progressed, seal after seal barring the way to safety having already been broken.

Looking back to the days when machine tools were built without guards and without any provisions for safety, we see the first seal broken when partial and limited guards were applied as a protection against gears, belts and other moving parts. The second seal was broken when makers supplied the complete guards with the machines as placed on the market. The third, when through a redesigning of the machines, gears and danger points were placed inside the machine out of reach, where no guarding was necessary. The fourth, when mechanical controls for shifting belts, operating chucks, changing feeds, etc., became the standard practice; the fifth when individual motor drives largely replaced the use of exposed belts and eliminated other features of danger. The sixth, giving attention to the location and lighting of machines and proper instruction in their use, including also matters of clothing, goggles, etc. The breaking of this sixth seal for safety is still in progress, as is the breaking of the seventh, giving protection at the cutting point, the most dangerous as well as the most difficult of all to guard.

THAT much has been done to make the operation of machine tools safe is pointed out in this article by Luther D. Burlingame, who has been prominently identified with the machine tool industry for many years. He emphasizes, however, that much remains to be done, especially along the lines of educating workmen to use safe methods in carrying on their work. As he aptly says, "It is not that we should guard machines less, but that we should educate for safety more."

In connection with provision for the control of feeds, speeds and direction by conveniently located levers and push buttons on the outside of the machine, within easy reach and away from danger points, is the feature of convenient and safe dual controls from different stations, so that the workman does not have to step around or reach over the machine. Modern equipment often also includes automatic oiling and automatic control of the coolant. It is important that levers and other hand-operated parts shall have sufficient clearance so that the hand will not be pinched or the knuckles "barked" when at the extremes of movement. It is a feature of protection from accidents as well as safety to the work and tools to have the levers always operate in the direction of the traverse or feed. Where hand-wheels, cranks or other hand-controlled elements are used, and where they may at times be operated at comparatively high speed, the mechanism should be interlocked in such manner that it will be disengaged so as not to revolve when the power feed is engaged.

When cone pulleys are used and belt shifting is thus required, it has not as yet become usual, except on heavy types of machines, to make belt shifting devices a part of the regular equipment, these still being considered as extras as are also power-controlled chucks, except on turret machines. The trend of the times, however, is toward the adoption of such features, not only because of utility as labor-saving devices, but also for safety.

More attention is being given to providing chain hoists and other accessories as a part of the regular equipment of the machine, so that heavy work and attachments can be moved with less physical exertion and with greater safety. Where chain hoists are used, the question of safety in testing the links of the chain becomes an item for attention. Where power hoists are used, a "kink" is to have the hand-pulls arrow-headed, with the one that lifts pointing up and the one that lowers pointing down.

A convenience in placing heavy work between centers is to use "cradles" in which the work can rest so that when the footstock center is advanced the work is raised from the rest sufficiently to clear. After the operation is performed, the withdrawal of the center allows the work again to rest in the "cradle" ready for removal. This method is especially useful for heavy work in grinding and polishing machines as well as in some classes of heavy lathe work.

Automatic Operation Reduces Accident Hazard

The more completely stock to be operated on can be moved automatically by power, the greater is the reduction of the accident hazard. An example is in the magazine feed for automatic screw machines by which a new piece of stock is automatically fed into the machine upon the exhaustion of the previous piece.

The fifth seal to be broken for safety is in eliminating the cone drive by substituting a constant-speed belt drive, or better still by using a motor drive. It is generally conceded that the use of a motor drive increases the safety of operating a machine, although it is important that electric equipment should be properly installed and carefully inspected to avoid lurking dangers. As compared with a machine of the same class driven by a belt on a cone pulley, the motor-driven machine

*Industrial superintendent, Brown & Sharpe Mfg. Co., Providence, R. I. Abstract of a paper delivered at the annual meeting of the power press section of the National Safety Congress in Chicago, on Oct. 9.

represents a decided step forward in measures for safety.

When a machine is being repaired or oiled, the power should be shut off. Many insist on having the starting device locked so that the machine cannot be started until after repairs or adjustments are completed. Such measures, although some may think them extreme, help to keep safety in the minds of workmen.

Safety is affected by the location of machines as regards daylight and artificial light, aisles, distance from walls, columns, and other machines. Keeping the machine in good repair is also an important means of preventing accidents. The human element must always be reckoned with and is often a greater factor than guarding in preventing accidents. The safety program along this line is, however, intangible, and therefore does not always receive the attention that its importance warrants.

Fool-Proof Guarding Is Necessary

The fact that many operatives who have never before seen the inside of a machine shop are put to work on machines and that because of modern equipment employees with lower mentality as well as of less experience are often used makes the need of "fool-proof guarding" and instruction in safe methods of work more essential if accidents are to be avoided. Training workmen to become "safety-minded" by instruction, by giving them responsibility on safety committees and by the safety leadership of foremen and management are factors in breaking this sixth seal for safety.

When operators handle work where sharp or rough edges are liable to cut the hands, it is sometimes advisable to wear gloves; but generally speaking, the use of gloves around a machine adds a hazard which more than offsets any advantage gained. It is found that an unexpectedly large number of accidents, some being rather serious in nature, result from slipping wrenches. This is often due to the nibs of the wrench being spread so that it does not properly fit. The remedy is frequent inspection and repair of wrenches.

The wearing of caps by women operators of machines is a reasonable requirement to eliminate painful and disfiguring accidents. The wearing of goggles as protection from flying chips, or grindings, should become more and more the established practice.

The tendency of old employees to resist steps taken for their own good is illustrated not only in the use of goggles, but also when the use of safety dogs is required. Such workmen will often hunt up old-style dogs with projecting set screws, perhaps secreted for the purpose, instead of using the modern lathe dog with safety screw. To eliminate from the shop the old and more dangerous type of dog is a way to overcome this tendency.

Most Machinery Accidents Occur at Cutting Point

The seventh seal, which, when broken, will still further lead the way to safety, is in guarding the cutting point, which has already been named as the point of greatest danger. In woodworking machinery a greater amount of study has been given to such guarding, and perhaps for that reason more satisfactory results have followed. Cannot equal study give like results for machining tools? The flying chips from lathe work, the hazard of revolving cutters and drills, the danger from punch presses and shears and from grinding wheels will illustrate. At a machine tool factory, with over 6000 employees, less than one-fourth of the cost of compensation for accidents was for cases involving machinery, but more than three-fourths of the cost which came in this classification was for accidents occurring at the point of cutting, showing the importance of finding means for breaking this seventh seal obstructing the way to safety.

A lathe chip guard, with a glass opening, so that the work may be safely observed, is widely used, but it has limitations for many kinds of work, in fact to a point where its universal adoption cannot at present be recommended. The same can be said about milling cutter guards. Many designs have been brought out and some are satisfactory for use on certain jobs; but so far as known no guard universally applicable for this purpose has as yet been devised. The simple expedient of providing a brush to wipe away the chips so that the conditions of cutting can be seen and strict rules that the fingers shall not be used for this purpose eliminate one of the greatest hazards in milling machines. Another expedient used to advantage is to have a stream of coolant under pressure so that with a hand-operated valve a stream of sufficient force can be thrown against the cutter to clear away the chips. These expedients, however, are palliatives, not cures.

Guarding the grinding wheels is quite general, but a hazard exists for internal grinding for it does not seem practicable to provide a guard which can remain in place. The particular hazard here is that when the wheel is run back out of the work and a gage is used for testing the hole, there is danger of its releasing suddenly and the hand being cut against the revolving wheel. There are designs of guards to protect against this danger by the guard being automatically swung into place in front of the grinding wheel when the latter is withdrawn from the work, thus protecting the workman in case his hand should slip.

Important to Guard Against Fying Chips

Questions of guarding against flying chips, where guarding in the past may have been of doubtful expediency, may, when machine tools are designed for the record-breaking speeds now being experimented with, become of paramount importance. It is also a case where the human element must be given full consideration in order that safety may be insured, these more hazardous operations requiring workmen with steady nerves and superior intelligence, the demand being as great or greater, than in the case of the old-time mechanic, who, while he could produce marvelous results that handicraft skill required, might not be sufficiently versatile to fit himself to the equally exacting, although modern, conditions.

When definite steps to break the seals of safety were taken a quarter of a century ago, the general impression was that the remedy for accidents was for employees to guard gears and other moving parts of machines and that when these first and second seals were broken, the work would be completed. An analysis of accidents soon showed that by far the greater number were not caused by lack of physical guarding or equipment of machines, but were due to other causes, involving carelessness on the part of workmen or laxity in general shop instructions and practices; that, while but 15 or 20 per cent of accidents could be prevented by guarding, the most important effort was needed along the lines of educating workmen and foremen to use safe methods in carrying on their work.

Accidents Reduced 50 Per Cent by Foremen's Cooperation

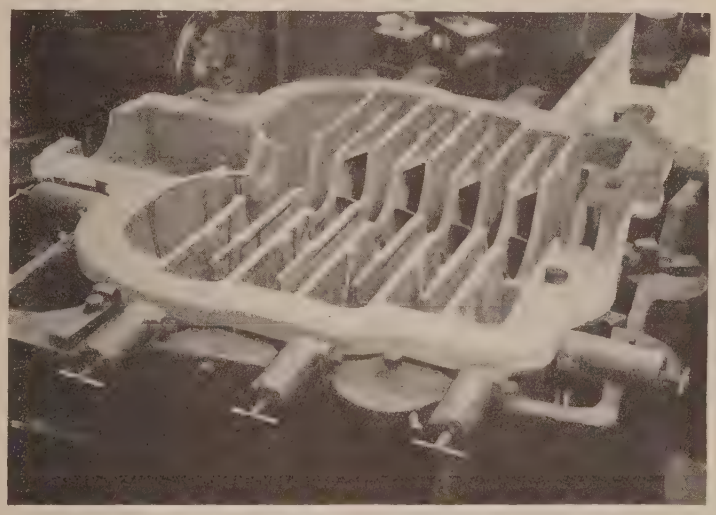
Over and over again it has been shown that when the foremen's cooperation can be fully enlisted, accidents, even in a well-ordered and well-guarded shop, can be cut in half. It is not that we should guard machines less, but that we should educate for safety more, so that the future may see this sixth seal of safety fully broken and the seventh, having to do with the still greater hazard at the point of cutting, made a matter of intensive study in order that it, too, may yield to the skill of the safety engineer.

Modern Tools Cut Production Time

Centrifugal Compressor Machining and Assembling Reduced from Three or Four Weeks to Three 8-Hr. Days by New Manufacturing Layout

CONFRONTED with the problem of manufacturing centrifugal compressors heretofore made by another company for its Centrifugal Refrigeration System, used for cooling theaters and other public buildings, the Carrier Engineering Co., Newark, N. J., has developed a method that reduces machining and assembling time from three or four weeks to three 8-hr. days.

Although the problem involved manufacture of the impellers, impeller shaft and other parts of the compressor or gas pump, description of machining the casing will serve to show the thoroughness and skill with which the entire proposition was handled. Also, this part of the manufacturing problem was, perhaps, the most troublesome, and in the selection and adaptation of machine tool equipment, fixtures, tools and gages, traditional methods were largely disregarded.



IN Redesigning with Reference to Manufacture, the Number of Parts in the Compressor Casing Was Reduced from 28 to 2 and Those in the Labyrinth from 216 to 22

As previously made, the pump casing consisted of 28 separate parts that necessitated some 44 machining operations. Being the "neck of the bottle" in the manufacturing process, this casing was closely studied and a way found to cast all parts in each half integral, which permitted machining the two halves in one set-up, thus combining the 44 operations. The redesign also resulted in reducing the number of parts in the labyrinth from 216 to 22. There is but one other machining operation on the casing, final reaming, which is done on a machine using special "combined" reaming tools, after the two halves are bolted together.

The casings are close-grained gray iron castings. Machining operations consist of milling the joints, boring six, seven or eight stages, boring and facing the impeller bearings and grinding the joints—all of which is done at one set-up on the 86 x 72-in., 18-ft. bed, planer-type milling machine illustrated, which was built by William Sellers & Co., Inc., Philadelphia. This machine has one rail milling head, one right-hand side-milling head, a grinding head on the rail, and a boring head that is carried on an extended apron integral with the left-hand end of the cross-rail. Being standard units, the two milling heads permit use of the machine for other work when the pump casings are not being machined.

Each half casing is set and locked in a separate fixture, which by means of a tongue and groove is located positively on the table, with relation to the boring head and to the corresponding table locks. The castings are placed joint upward in the fixtures and the first operation is milling this joint. This is done as a standard planer-type miller job, using a 12 or 16-in. inserted blade cutter in the rail head. One rough and one finish cut is taken, 3/16 in. metal being removed in all.

The next operation, boring out the centrifugal pump stages, is of unusual interest. For this a special Davis boring bar is bolted to the boring head faceplate and supported by outboard bearings fastened to the cross-rail, as shown. This bar, which is 7 ft. long and weighs more than 2000 lb., is made up of a number of integral disks corresponding to the number of stages in the pump. These disks and the bar proper contain the cutters necessary to bore and face the pump stages to the exact diameters and thicknesses. The cutters, 86 in all, are removable and are accurately set by micrometer gages, it being possible to remove and grind any cutter without disturbing the others. An idea of the accuracy of this work may be gained from the fact that on this casting, which weighs about 3000 lb. there are 41 dimensions calling for a limit of plus or minus 0.001 in., four calling for a limit of 0.002 in., 18 dimensions calling for a limit of plus or minus 0.0025 in., two requiring a limit of plus or minus 0.004 in., and 51 requiring a limit of plus or minus 0.005 in.

When the boring bar is in place, the table is traversed to the fixed stop opposite one of the castings or fixtures, and is locked in position. The boring head, driven by the rail milling head, is then set for the proper speed and the boring bar is set in motion. The crosshead, adjusted by unusually large screws, is then fed down slowly and steadily, carrying the rotating boring bar with it. When the cutters have been fed into the casting

the proper distance, the various pump stages, and the end and the intermediate bearings for the impeller shaft have been finish bored and faced to limits required. In this operation the cutters are fed down to a point which is 0.005 in. below the true center line, the gage illustrated herewith being used in this connection.

One half being finished, the cross-rail is raised and the table unlocked and traversed to bring the other half of the casing into position, which is bored out in exactly the same manner as the first.

The foregoing boring and facing operations were confined to surfaces of relatively small diameter. A second boring operation on the larger surfaces is then performed. For this a boring bar of similar design but larger than the first is employed. It is supported and driven in the same manner as the first, but is revolved at a slower speed.

Casing Joints Ground at Same Set-Up

Boring and facing operations on the two halves of the casing now being completed, the casings are then prepared for the final operation on the planer-type milling machine, that of grinding. The fixture clamps are loosened to relieve the castings of strain, the boring bar is removed and the grinding head brought into operating position. Then by traversing the rail and adjusting the grinding head slide, the wheel is set to grind off the 0.005 in. previously allowed for finish. Length of travel and reversal of the table is controlled as on a planer, except that the speed in both directions is the same. The grinding head is arranged with screw feed across the rail.

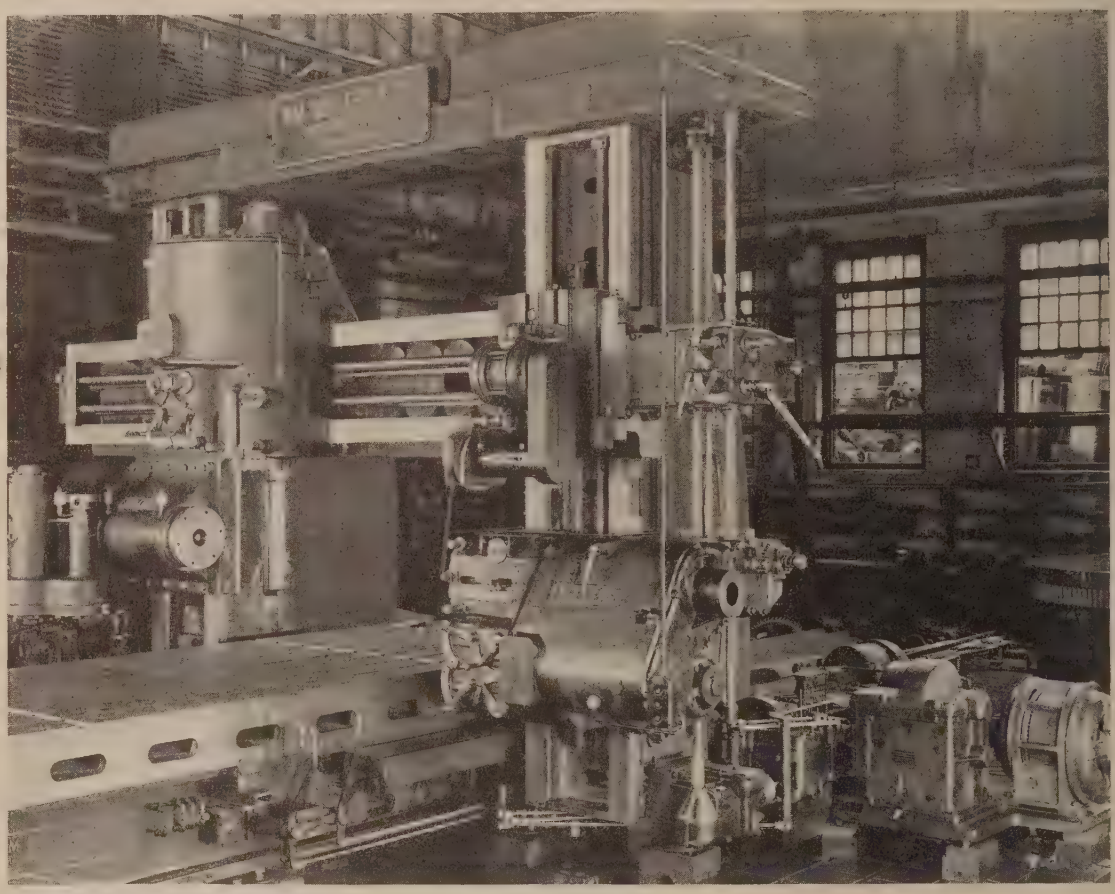
Reamer Bar Is 7 Ft. Long, 7 In. in Diameter

The casings are then removed from their fixtures, bolted together and then the bore for the impeller shaft is reamed. After the cases are taken from the machine, the two extreme surfaces which are used to support bearings are accurately scraped to a half-circle gage, which assures the casing being split on the center. They are then joined, with a plug in each end, and the dowel holes reamed; this assures proper alinement of the two outside holes.

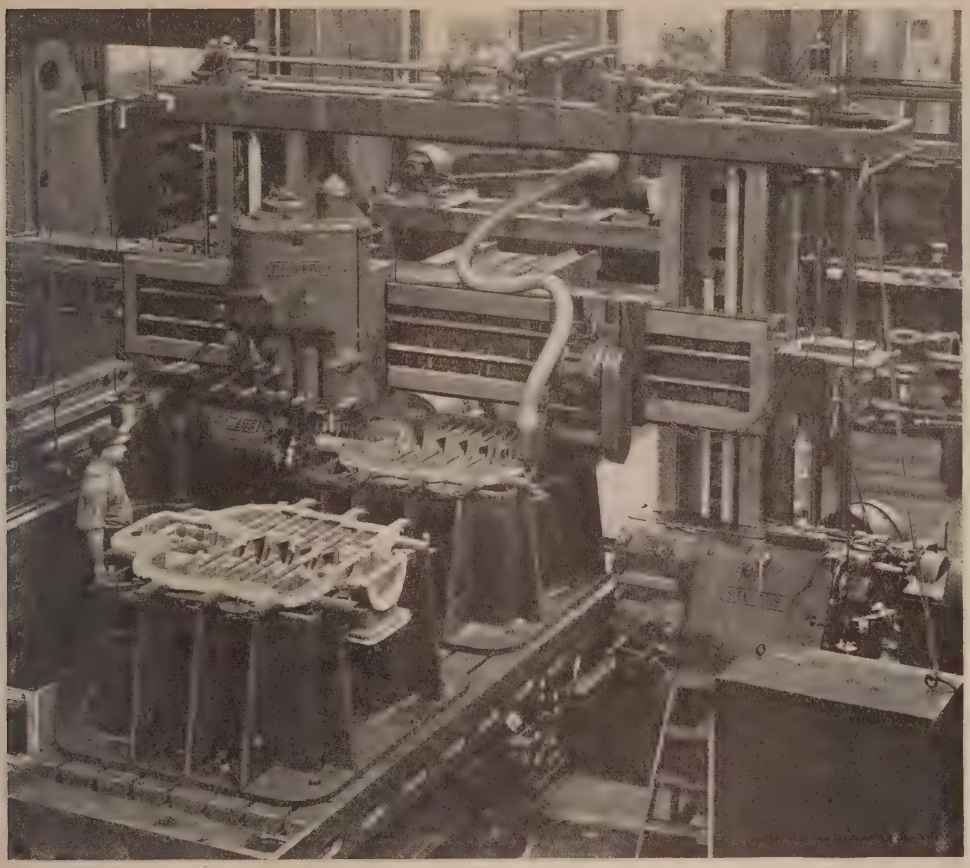
The 7-in. diameter 7-ft. long reamer bar shown herewith is then placed in the case on special bearings which replace the standard bearings used later. It is revolved and fed forward a distance of 2 in., when all the surfaces in the machine are accurately alined and sized; the casing is then ready for assembly.

Planer-Miller Heads Have Individual Motor Drive

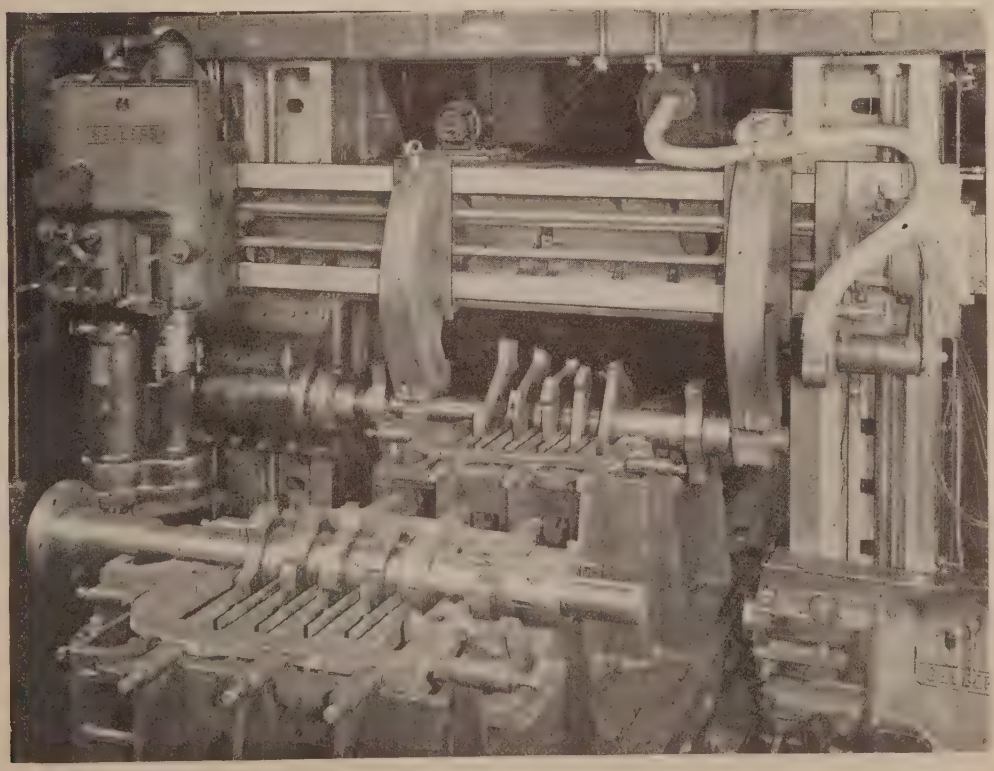
The Sellers planer-type miller is a slight modification of the standard machine described at length in THE IRON AGE of Nov. 1, 1928. Heads have individual motor drive,



IN Addition to the Rail and Right-Hand Side Milling Heads, the Sellers Planer-Type Miller Has a Grinding Head, on the Rail, and a Boring Head That Is Carried on an Extended Apron Integral with the Left-Hand End of the Cross-Rail. Heads have individual motor drive. Control is by push buttons and is completely interlocked

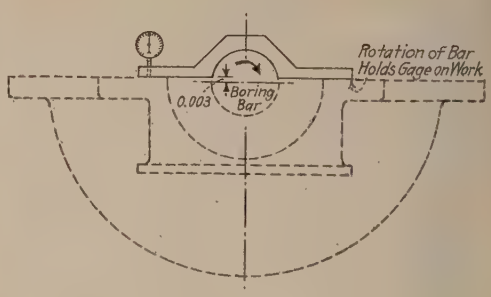


THE Two Halves of the Casing Are Machined in One Set-Up, Except the Final Reaming After the Halves Are Bolted Together. Operations consist of milling the joints, boring the stages, boring and facing the impeller bearings, and grinding the joints. The machine employed is a slight modification of the standard planer-type miller built by William Sellers & Co., Philadelphia



FOR Boring Out the Pump Stages a Special Davis Boring Bar Is Employed. This bar, which is 7 ft. long, weighs more than 2000 lb. and contains 86 accurately set cutters, is bolted to the boring head faceplate and supported by outboard bearings fastened to the cross-rail, as shown

FOR the Reaming That Follows the Planer-Type Miller Operations, a Special Reamer Bar That Is 7 In. in Diameter and 7 Ft. Long Is Used



GAGE Used in the Boring Operation. The boring bar is fed down until the gage rests on the casing—the indicator reading zero—which leaves 0.005 in. for grinding

as described in connection with the standard machine, and 16 different speeds, ranging from 15 to 300 r.p.m., are obtainable through sliding gears and clutches.

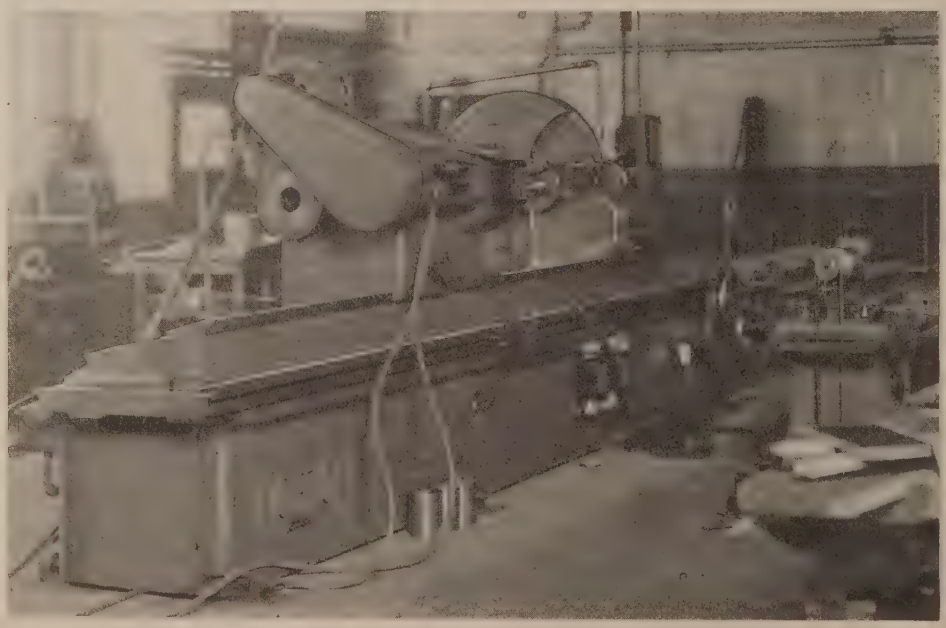
The special boring head, driven through a coupling by the rail milling head, utilizes a ground worm and a worm wheel to revolve the horizontal boring spindle. It has a range of speeds from 1 to 20 r.p.m., obtained through the gear changes in the milling head. The grinding head is equipped with a 12-in. wheel which is mounted on a horizontal spindle and driven by a 5-hp. motor through Texrope drive. Both the motor and the grinding spindle are mounted on a slide for fine adjustment.

The extended back type cross-rail, the deep box table carried on one flat and one double-vee way, the table drive and bed construction are the same as in the standard machine. A change gear box and rheostat provide the necessary feed range and rapid traverse, this type of drive being said to assure the steady feed so essential to smooth and accurate finish.

All motors are controlled by push buttons from panels located on both sides of the table, which arrangement makes it unnecessary for the operator to move from one side of the machine to the other to start, stop or reverse the motors. Control of the machine is completely interlocked; feed motors cannot be started in advance of the cutter motors; overload on the cutter motors will slow down or stop the feed as occasion demands. Safety clutches are added as precaution against abuse.

Impeller parts are die formed, the material being stainless steel of special quality. When the impellers are assembled on their shaft, the entire assembly is mounted in the massive 36 x 144-in. special Norton grinder illustrated, which finishes all revolving surfaces. Following this the impeller unit is dynamically balanced.

The grinder, designed for unusually large diameter work, is similar to the standard 28-in. Norton machine, except that the wheel-slide is hydraulically operated and controlled by one lever at the front of the machine. A separate motor is used for driving the hydraulic mechanism, and another motor for the lubricant pump.



WHEN the Impellers and Shaft Are Assembled, a Special 36 x 144-in. Norton Grinder Finishes All Revolving Surfaces. The unit is then dynamically balanced

"Courageous Spending Needed in Industry"

Charles F. Abbott of American Institute of Steel Construction Says It Is "Wasteful to Be Penurious"

IT is no extravagance to spend money largely, but rather it is wasteful to be penurious, declared Charles F. Abbott, executive director, American Institute of Steel Construction, in an address before the National Industrial Advertisers' Association, which is meeting this week in Cincinnati.

Industrial and commercial success, Mr. Abbott said, has been predicated upon a courageous expenditure of funds and a willingness to be generous in all worthy efforts.

Mr. Abbott went on to say:

"Today successful businesses are conducted on an entirely different plan from that which prevailed in the pre-war days.

"To manage a business successfully requires as much courage as that possessed by the soldier who goes to war. Business courage is the more natural because all the benefits which the public has in material wealth come from it.

"The problem of sales management is far more important than it ever was. We must not only teach our salesmen how to sell, but, what is of greater importance, we must teach the public how to consume.

"In the past, business has been operated on what we may call the economy principle, the principle of paring down and of saving; and it has a wonderful and worthy background. America would never be what it is without it.

Creative Spending Policy Needed

"But as this policy has had to pass; as we now understand that the hold-tight, spend-as-little-as-you-can principle must give way to a new more constructive and aggressive outlook—so business is now beginning to emphasize the principle of creative spending rather than that of pinching economy. We feel it in our family, in our business, and in our national attitude.

"We do not need the old quality of caution today nearly so much as we need the new, the courage to plan and chart enterprise. In days when panics were just around the corner we naturally needed a great deal of caution and watch-dogging, but the panics of business are gone.

"We now have bigger things than merely guarding what we already have. We have a vast creative job ahead of us to raise the standards of living of the 73 millions of people who still exist at or below the minimum comfort level.

"We now know that if we are selling industrial equipment our market is limited by the sales of our customers to the public. If they could sell more we could sell more to the factories; therefore the need of studying conditions that underly consumer buying.

Discarding Old Economic Ideas

"We are discarding the old economic idea that business is limited and that we must fight like three dogs over two bones to get it. We are realizing that an industry full of unequal units—some very modernly tooled and some poorly tooled; some using up-to-date methods and some ancient methods; some practicing enlightened principles and some practicing unwise principles—need not be accepted with no change possible, simply as the way fate deals out the cards.

"We know that something can and must be done about it. We must lift up an entire industry toward a higher average in tools, methods, and business principles. We are willing to spend money to accomplish it—a great deal of money, individually and collectively. That is courageous and creative spending, the statesmanship of consumption, and genuine progress.

"Cyrus Curtis, head of the Curtis publishing interests, once said he had an executive in his employ whom he had to discharge *because he could never teach the man to spend enough money!* The man had been trained in the old school where all the credit went to the man who *saved* the most.

"When the time came for a decision to spend $100,000 of Cyrus Curtis's money, promptly and effectively, this man's hand trembled, he procrastinated, and the business suffered. Of course, some other man, even more incompetent, might have spent too lavishly and thoughtlessly. What was needed was a well balanced, keen-minded man who knew how to spend creatively; a man who would decide promptly and courageously, and then spend.

An Example of Courageous Spending

"No better illustration of courageous spending exists than that of Ray Smith, president of the A. O. Smith Corporation, Milwaukee. With nothing but an idea, about eight million dollars was appropriated and expended before the idea was found to be practical. A great deal of courage and a lot of money were required, but the production of automobile chassis was increased from a few hundred to 10,000 a day. At the same time the manual staff was decreased to a fraction. Four hundred engineers engaged in research made possible another reduction in the sales force and only eight are now required to dispose of the output. To go a step further, the same enterprise was shown in the development of welded steel pipe, with the result that 26 miles of pipe a day can now be produced. Simultaneously other plants engaged in producing automobile chassis and steel pipe were rendered obsolete, unable to compete with such remarkably low costs. Without the courage and the spending as inaugurated by this one man the public would never have received the benefits of these unusual results in cost reductions.

"Instead of the hang-on-to-the-dollar type, there was needed the spend-plenty-of-money-promptly-on-competent-analysis type. The old guiding general principle was saving; the new principle is construction. Both are wonderful, useful American traits, but right now we need the latter type.

Predicts Many More Mergers

"Business is now being transacted on a large scale because our people have the income which makes large scale consumption possible. Small business units cannot successfully serve such a public demand. There have been nearly 2000 mergers in the past two years. More are to follow because it is the large organization that alone can meet efficiently the problems of distribution that modern conditions are creating.

"Where smaller units of industry can operate economically in the field of production they are organizing into institutes and similar associations in order that they may take advantage of the economies possible through co-operative effort in the field of distribution.

"These organizations, as well as co-operative merchants, are successful only so far as men can be found who can operate them, men who understand big-scale spending, men who can courageously authorize creative advertising appropriations running into millions of dollars and conduct their affairs with the greatest economies; men who can competently make big decisions and make them promptly when the necessary facts are in, and if the facts are not in, then go out and get them. That is the modern research technique which molds the judgment of the courageous spender.

Plan for Tomorrow's Profit

"We have already learned, as Carnegie taught us in the steel industry,

that our plans should be for tomorrow's greater profit. This is what should govern our spending today—not what we did or spent last year. Carnegie scrapped one steel process after another, sometimes before the shine was off the million-dollar equipment, simply because he was investing in greater future profits and a greater competitive advantage. By doing so he plucked the steel leadership right out of England's hands, never to return.

"The steel skyscraper has done the same. So profitable is this creative process that we are tearing down modern buildings, only 10 or 12 years old, to erect others in their place which will make more money for the owners. A man who owns a 12-story building, fairly modern and built 10 years ago, standing on ground rapidly becoming more valuable, finds that he is unable to get out of that building a proper return on the increased valuation of the land, or as large a return as possible. But that is not all. His tenants cannot get the up-to-date elevator service, office standards and comfort from the building erected 10 or 12 years ago, so rapid has been our advance in building conveniences.

"Exactly the same holds true of the manufacturer who decides to own a modern plant. He might believe that he could continue to manufacture in his old tumble-down factory, erected before modern ideas of routing or sanitation were known. But if he considers the cost of handling materials, and his engineers make full use of every new tool, new method and new principle; reducing labor to a minimum and applying the latest equipment, the manufacturer will undoubtedly find that he has been paying an immense premium every year to remain in the old plant with the old equipment.

"It all figures down to an engineering and mathematical basis. Here lies the big task of tomorrow for all industrial advertisers—to sell the idea of creative spending, and even of creative wasting, to more people.

A Need for Bold Spenders

"We need bold, determined, aggressive spenders; daring but cool; risk-taking, confident, even colossal spenders. Does this sound startling? Don't be afraid. Carnegie was called a colossal spender because of his fast scrapping policy, but Carnegie literally set the modern American industrial pace.

"In our keen interest in Ford and the automobile industry we forget that the steel industry in the United States really took the lead and changed the entire program of American industry.

"Carnegie was the Ford of yesterday, and with his scrapping policy he laid the foundation on which modern business rests. He introduced a new kind of dynamics into business—speed, punch and courage to go forward, whatever the cost in waste, if the engineering facts pointed the way. He introduced the line and staff organization and respect for experts and for research.

"It is no accident that the present has been called the steel age. Steel not only holds up our great skyscrapers, but the history of steel is the history of industrial America.

"We need men who will go around a factory or an office with just the same determined look and say 'Out with it—I don't care what he says!' We may dislike to see the junk man make much money, but take it from me, for every dollar the junk man makes, we would make a thousand.

"Hanging on to old, out-moded goods is a terrific brake on progress. A man once said to me 'I have a suspicion that any city would be better off if an earthquake came along every 10 years and shook to pieces everybody's factory, office and equipment. It seems as if nothing but an earthquake could ever make some people wake up to their need for up-to-date equipment. Did you ever notice how vastly improved and more efficient and prosperous a city is that has had an earthquake or a flood or a fire?

"'There's no mystery about it—everybody buys new equipment, business is brisk, and production is increased because the tools are better. And why shouldn't everything be much better? It is new and up-to-date.'

A Job for Industrial Advertising

"Industrial advertising interests should assume the greater part of the burden of teaching courageous spending. You must do the educating. It is a big task to break down habit and general outlook on life, which is the real problem that stands in the way, but it can be done.

"It is often easier to sell a man a yacht, which will prove to be a big expense to him, than it is to sell him a profit-making idea of value to his business. We must never let up in our fight, because our industries will suffer by comparison if we do. We cannot lag behind in this fast, modern pace.

"Only the man who is sure of his results is courageous in his spending. He has no doubts as to the outcome. The steel industry has produced some such men, though it still is in need of developing a better public consciousness. 'As hard as steel' is quite generally recognized, but that does not improve the standing of the material in the eyes of the public. If, instead, we could get people to say 'as fine as steel,' we would be accomplishing something. But to do that would require a real advertising appropriation.

Cites George M. Verity's Policy

"George M. Verity is a good example of the courageous spender. 'Go ahead and try' was his slogan in August, 1914, when Armco iron was first produced. His policy was to go ahead and find out what the buyer wants, go ahead and find out how best to produce it. Go ahead and do. Go ahead and tell. He coordinated his selling plans with his production—he did not hesitate to discard the supplanted machine. He has kept as a permanent asset the first 'go ahead' order.

"By advertising to the employee, the stockholder, and the public, as well as to the ultimate consumer, the American Rolling Mill Co. has developed a consumer acceptance for a raw material. It has not hesitated to continue advertising even in a notorious sellers' market because it wished to retain the good will of its customers. It has engaged in collateral advertising to promote the sales of the fabricator of its material. Such advertising has lifted Armco iron out of the rut of raw products, and placed it in the forefront of consumer thought. It has been expensive, but it has more than paid dividends. That is what I call courageous spending.

"In the whole field of advertising media there are no more important publications to be considered or more thoroughly deserving a larger part of the appropriation than the trade and industrial publications. They form the very basis for the essential educational effort so necessary if the industry itself is to be advanced. They blaze the trail for creative spending because they speak for the industry and thereby assert its leadership. The public is recognizing more than ever before that trade publication advertising is the real, dependable source of information.

Doing a Better Job in Advertising

"We are doing a greater and better job in advertising than we ever dreamed of doing in the old days. It is costing more money, but it is breaking down resistance, promoting bigger things because it is genuinely creative spending.

"The technical and industrial field is rapidly coming into the bigger sphere of usefulness, and he is a bold man who can predict where this era will end. A single advertiser today probably spends as much as the entire industry did in the old days when industrial advertising was looked upon solely as a handout, or as mere good will or institutional advertising.

"I have an idea that 10 years from now, perhaps less, we will look back even on today as mere pioneering in the bigger things to come in creative spending. But I am also sure that your organization will continue to be, as in the past, at the very tip of the forefront of the advance."

An International Heating and Ventilating Exposition will be held in the Commercial Museum, Philadelphia, under the auspices of the American Society of Heating and Ventilating Engineers, Jan. 27 to 31, 1930. President Thornton Lewis of the society has named an advisory committee and a cooperating committee for the exhibition, and Charles F. Roth, Grand Central Palace, New York, is manager.

Knee and Column Type Miller

Ease in Changing Feeds and Speeds a Feature—Plain, Universal and Vertical Units Made

AN improved and simplified method of changing speeds and feeds, and independent directional control levers for cross, vertical and longitudinal movement of the table, are features of the new No. 3 Cincinnati knee and column type miller which has been placed on the market by the Cincinnati Milling Machine Co., Cincinnati. This machine is being manufactured in the plain, universal and vertical types, operated by belt or inclosed chain motor drive.

Change in speeds and feeds is made convenient by means of an automatic power shift for the spindle speeds as well as the table feeds, controllable from either the front or rear of the machine. To change speeds the operator disengages the starting lever, throws the speed and control lever *E* (or lever *C* if working from the rear) to "Speed." The speed dial *B* rotates while the lever is in this position. When the speed desired on colored dial *B* appears opposite the arrow, the operator releases control lever *E*, pushes starting lever *A* away from the column, brings it back and then pushes it up.

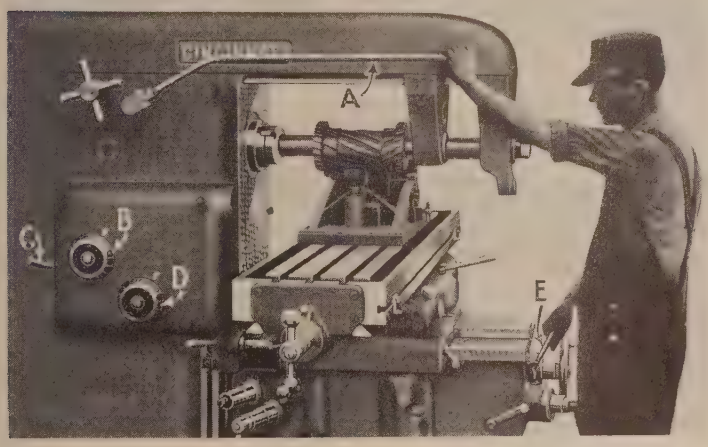
To change feed, the operator throws speed and feed control lever *E* (or lever *C* if working from the rear) to "Feed" position on the plate. This lever is held on this position until the desired feed on the colored dial *D* registers with the arrow and is released. It is claimed that the ease with which these changes can be made will result in the operators being more likely to change the feed and speed demanded by the cut, thus giving greater production and a higher quality of the milled surface.

Every movement of the machine's table has a power rapid traverse, in addition to the power feed, operated from either the front or rear. The rapid traverse is available with the spindle either stopped or running. Rapid traverse rates are: Longitudinal, 100 in. a minute; cross and vertical, 50 in.

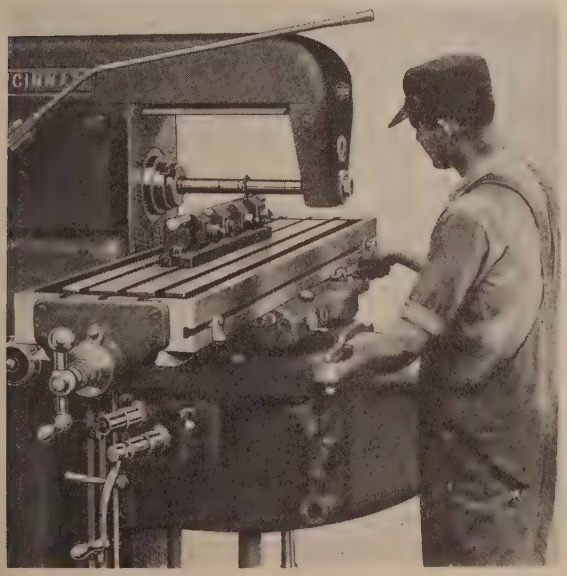
Illustrations show the operator taking a cut, with his right hand on the directional control lever and left hand on the power quick traverse. To rapid traverse out of the cut, he shifts the feed lever in the opposite direction and pushes down on the power quick traverse lever. It is necessary for the operator to hold this lever in position; as soon as he releases his hand, it clicks into feed. The rapid traverse for the table on the plain machine can be automatically disengaged by dogs on the side of the table. In such case, however, the operator holds the power quick traverse lever in position.

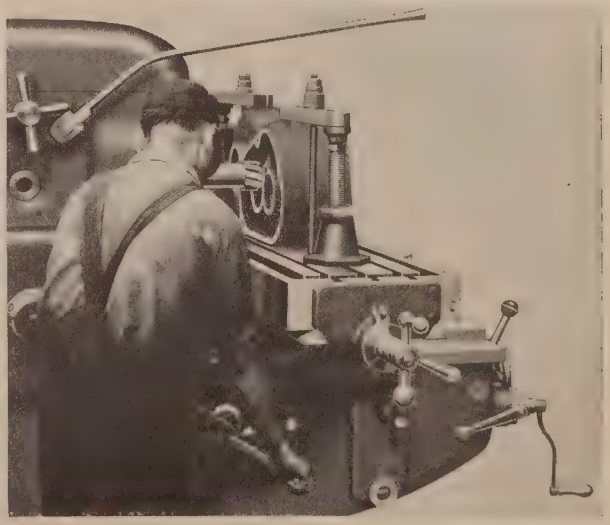
Hand adjusting cranks at the rear as well as at the front of the machine are provided for getting accurate cross and vertical adjustments. New micrometer dials, easily read, provide for accurately getting the desired hand feed.

The Cincinnati double mounting of anti-friction bearings at both the front and rear of the spindle, with a floating rear bearing, are used on this new machine. New proportioned



SPINDLE Speeds and Feeds Are Changed from Front by Power. To change speed, operator (upper left) pulls outward on starting lever and shifts lever at front of knee. Front independent directional control of table, knee and saddle movement and power quick traverse are features of machine. Operator (lower left) is taking cut with right hand on directional control lever and left on power quick traverse. Rear control of hand feeds is illustrated (lower right) by operator making accurate cross adjustment from rear with hand adjusting crank having large micrometer dial





gears slide on heat-treated spline shafts. Gear contacts in the spindle drive have been reduced, giving four on the forward and five on the reverse, thus making a positive direct drive. The rectangular overarm has been increased in size and the two arbor supports are made of aluminum, with automatic lubrication provided for the bearing collars.

A cutter coolant pump having a capacity of 8 gal. a minute is supplied as standard equipment. The mechanism within the column, including the spindle drive, runs in a bath of oil supplied by a gear pump inside the column. A pump located in the knee automatically lubricates the knee, while the saddle and table are lubricated by a one-shot oil system at the left end of the saddle.

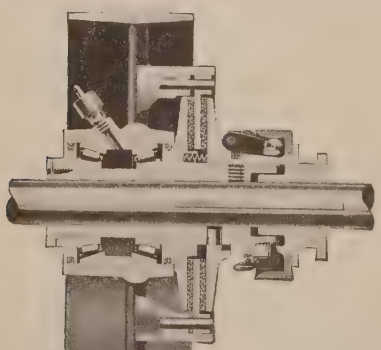
The leadscrew construction has been improved and the elevating screw—a single piece screw—has been substituted for the sleeve formerly used. The general proportions of the knee, column and other parts have been increased in dimensions. In addition, narrow guides and new type gibbing have been provided.

The table has a working surface and a size overall of 15 x 62½ in., with three 13/16-in. T-slots. The table on the universal type swivels 45 deg. The longitudinal range of all three types is 34 in.; the cross range of the plain and universal machines is 12 in., and the vertical type, 16 in. The vertical range on the plain type is 20 in., the universal 19 in. and the vertical 12 in. The machine is operated by a 7½-hp. motor running at 1720 r.p.m. The floor space occupied by the plain and universal types is 106 x 113-in. and by the vertical type 90⅝ x 113 in.

New Edgemont Disk Clutch

EASE of adjustment is a feature of a new disk clutch designated as the type SF which is being marketed by the Edgemont Machine Co., Dayton, Ohio, for a variety of applications, from countershafts to machines of all kinds. It is designed for transmitting either low or high speeds and for either slow and easy or quick pick-up of the load.

The mechanism is provided in a complete line of pulleys, with either oil-sleeve bearings, Timken roller bearings, and Fafnir transmission ball bearings. They are also made in extended sleeves, on which pulleys, sheaves, gears, etc., can be mounted. The mechanism alone can be furnished to those desiring to make their own mountings.



Single Adjustment, Made With One Hand and Without the Use of Tools, Is a Feature

Adjustment of the clutch may be made with one hand and without tools; it simply requires pressing down on a lock lever and turning the adjuster until the lever snaps into the next slot. Renewable asbestos metallic liners of large friction area are used, and the steel cam and rollers are hardened to assure long life. The design is such that it is impossible for centrifugal force to engage the clutch or cause dragging at any speed. Levers push on the plate without sliding action, thus eliminating wear at this point. The clutch is easily operated, rollers in long levers, and there is no sliding under heavy pressure. This permits the machine to be inched along.

Electro-Mechanical Riveting Machine

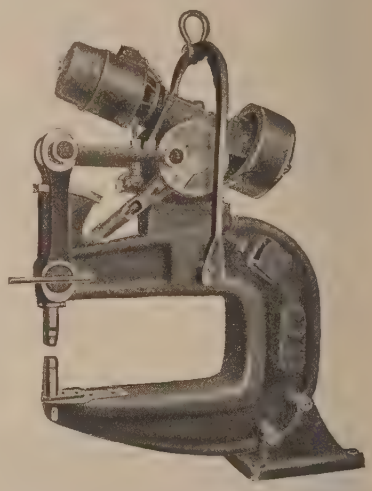
SAVINGS in power consumption, reduced maintenance expense, and high working speeds are claimed for the electro-mechanical toggle-lever riveting machine, known as the L. M. G., which is being marketed by the United Machine Tool Corporation, 75 West Street, New York.

The machine is entirely self-contained and is said to drive up to 24 rivets a minute. Seven sizes are built, the capacity of the largest and smallest machines being as follows:

	Type EKN II	Type EKN VIII
Working pressure, maximum	27 tons	145 tons
Boiler rivets, maximum	⅝ in.	1⅝ in.
Structural rivets, maximum	¾ in.	....
Stroke	2⅜ in.	4⅜ in.
Size of motor	2 hp.	7½ hp.
Hp. required for no load	0.8	1.5

Arrangement of the machine may be seen in the illustration. From the motor, the drive is through a steel worm and phosphor bronze wormwheel, contained in a housing between the motor and the flywheel, to a set of driving disks that are connected to the toggle levers. Between the wormwheel and the driving disks there is a clutch that is controlled by a handle just above the upper jaw of the yoke frame. The machine can be adjusted to operate continuously, or so that the plunger stops at the top and the bottom of each stroke, permitting the rivets to cool under pressure as long as desired. The plunger is adjustable.

The distance between the jaws is regularly 15¾ or 19¾ in., but other heights can be furnished. The depth of throat ranges from 1 ft. to 13 ft. 2 in. The machine will work in any position. Special types of hangers, or bales, such as swing cradle hangers, that permit sideways tilting of the machine, semi-universal or full universal hangers can be furnished. The flywheel, which runs at 1000 r.p.m., is connected by friction to the main driving shaft, and is disconnected automatically in case of overload. The motor starter is mounted on the yoke-frame, just below the flywheel, and the main switch, fuse box and socket for the cable connecting block is mounted on the side of the frame, as shown. A detachable foot that adapts the machine for stationary use is provided.



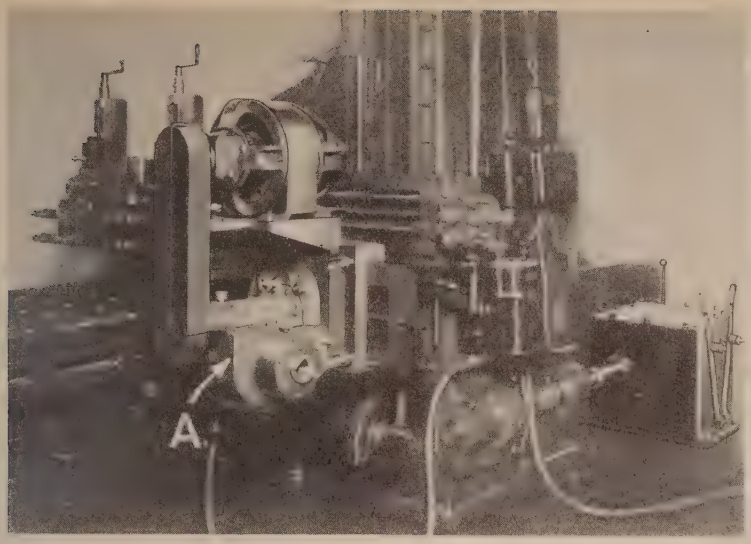
From the Motor the Drive Is Through Worm and Worm Wheel to Driving Disks That Are Connected to the Toggle Levers. Motors range from 2 to 7½ hp. and working pressures from 27 to 145 tons

The net weight of the smallest machine ranges from 1540 to 6270 lb. and the weight of the largest from 10,560 to 42,900 lb.

Harnischfeger to Expand

The Harnischfeger Corporation, Milwaukee, manufacturer of excavating machinery and electric traveling cranes, has announced a change in its financial structure by which the present common stock, consisting of 40,000 shares of no-par value, will be increased to 500,000 shares. Seventy-five thousand shares are being offered to the public through Otis & Co. and the First Wisconsin Co., Milwaukee. Approximately $2,000,000 of the fund provided by the new financing will be put into a two-year expansion program which will result in an increase of 50 per cent in the company's capacity.

The Northern Blower Co., Cleveland, has installed its Norblo dust collecting equipment in the plants of the Crucible Steel Casting Co., Lansdowne, Pa.; Rensselaer Valve Co., Troy, N. Y., and the Florence Pipe & Foundry Co., Florence, N. J.

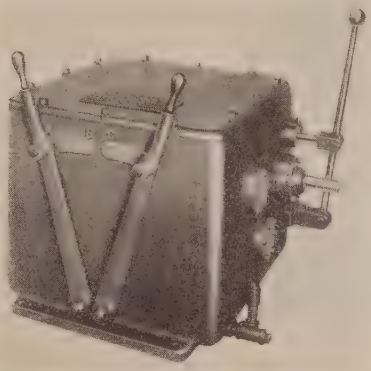


Milling Head for Use on Planers

AN improved milling machine head for planers is being manufactured by the Adams Co., Dubuque, Iowa, in three sizes. Although the illustration shows the head, *A*, mounted on the side rail of a Cleveland open-side planer, the same equipment can be used as a rail head, and an outer bracket can be supplied for supporting the end of horizontal arbors.

The drive is by means of a hardened steel worm engaging a phosphor-bronze worm wheel on the spindle, both the worm shaft and the main spindle being mounted on precision type Timken bearings. The head can be swiveled to any angle and consequently can be used for horizontal, vertical or angular milling. The saddle shown is made with an overhanging bracket to support an electric motor which drives the worm through silent chain and sprockets. A plain saddle and countershaft equipment can be supplied for the belt-driven unit.

The special gear box shown in the separate illustration was designed to provide the necessary reduced table speeds for milling. The shafts are multiple splined and are mounted on Timken bearings; the entire mechanism runs in a bath of oil. When planing operations are to be performed, throwing in of the clutch lever couples the driving and the driven shafts, and with the clutch out of engagement, a variety of milling speeds is available through the sliding gears. Any series of speeds can be provided, to meet requirements.



Milling Head Applied to Side Rail of Open-side Planer. The special gear box, shown above, provides suitable table speeds for the milling operation

Die Maker's Reamers

A REAMER having a taper of ¾-deg. included angle, or approximately 0.013 in. per in., is being made by the Morse Twist Drill & Machine Co., New Bedford, Mass., for use by die makers.

In laying out a die, holes can be drilled close together, thus outlining the shape desired, then reamed by the taper reamer until the holes run together and the central piece drops out. The tool can then be used on the outline of the die edge as a spiral mill, the resulting clearance being correct for the finished die. The larger sizes of these reamers may be used for profiling.

Rapid action and absence of chip clogging are features emphasized. Freedom from breakage is attributed to the fact that the easy shearing cut imposes little strain upon the cutting edges. Reamers with other tapers and in special lengths, both high-speed and carbon steel, can be furnished. Twenty-three sizes of the die makers' reamer, which is designated as the No. 678, are regularly made, the smallest having a diameter of 0.058 in. at the small end and 0.073 in. at the large end. The corresponding diameters of the largest tool are 0.443 and 0.518 in., respectively.

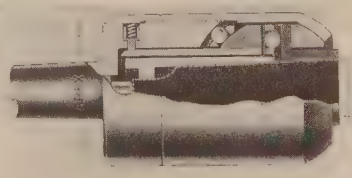
Having a Taper of 0.013 In. Per In., the Reamer is Suitable for Die Work

Full-Floating Tool-Holders

IN the full and semi-floating tool holders recently brought out by the Apex Machine Co., Dayton, Ohio, angular float is obtained by the upper row of balls and parallel float by the lower rows; in each case there are two rows at right angles. The balls operate in hardened and ground grooves, and in addition to producing a free floating tool, they minimize friction. The semi-floating holder has parallel float using only the lower row of balls.

In using the device in connection with reaming, the holder permits the reamer to follow the hole, correcting for misalinement between the work and the spindle or turret, and thus eliminates bell mouthed and tapered holes. Holes may likewise be tapped true to size.

An inserted socket type of this tool, having little overhang and adapted particularly for hand screw machines and automatics, is also manufactured.



Angular Float Is Obtained by the Upper Row of Balls and Parallel Float by the Lower Row

Two continuous pack-heating furnaces for finishing high-grade sheets are to be installed by the Wean Engineering Co., Warren, Ohio, in the plant of the Michigan Steel Corporation, Detroit. Two similar furnaces are reported by the Wean company to have been erected at the Empire Steel Corporation in the record time of six days each. The Michigan order brings the total number of furnaces of this type in the United States to 62.

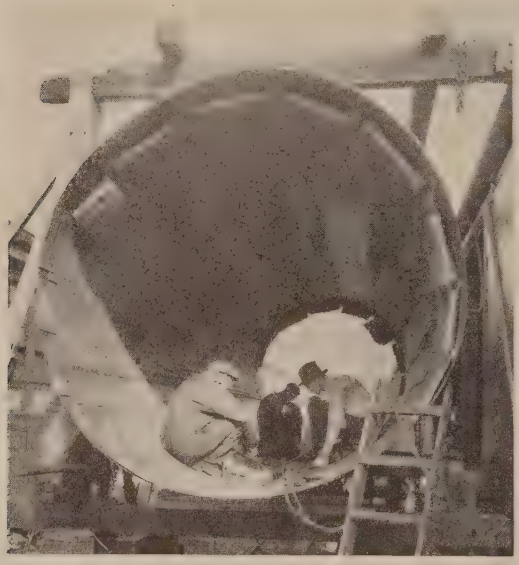
Pennsylvania Fabrication Co., Verona, Pa., has taken over the structural steel fabricating plant of the Bollinger-Andrews Construction Co. at that point and plans to begin operations this week. The latter company went into receivership a year ago.

Lining Tanks with Lead Strips

Method of Attaching Sheet Lead in Non-Homogeneous Coating Said to Save Cost

LEAD linings are being applied to tank car tanks by an interesting method, devised by the Gross Lead Burning & Coating Corporation, 3955 West Twenty-fifth Street, Cleveland, which is an adaptation of the lead-coating process developed by this company and described in THE IRON AGE, April 7, 1927. In the Gross process a liquid lead flux made from a formula developed after long experimental work is used, in place of the usual solder flux. An advantage claimed for this flux over ordinary soldering flux is that coatings applied with its use will withstand heat and acids.

Ordinarily the flux is applied to the surface that is to be coated, forming a skin base. A homogeneous coating of lead is then put on by means of a burning bar and oxy-acetylene torch. However, the expense of applying the coating was an objection to the use of this process for the homogeneous coating of large tanks. By the method adopted it is stated that the cost has been reduced to one-third of the cost of a homogeneous coating.



SHELL of 10,000 Gal. Tank Car, with Heads Off, and Operators Burning in the Lead Sheets. As shown, the tank is inverted, the dome being at bottom

The tanks being lead lined are for standard 10,000-gal. tank cars. They are 9 ft. 6 in. in diameter and 28 ft. 6 in. long, fabricated of tank car specification steel plates. Instead of providing a homogeneous lead lining, a series of strips of homogeneous lead bands ⅛ in. thick by 2 in. wide, extending the length of the tank, were applied lengthwise on the inside by the Gross method, and lead sheets were attached to these bands, the edges of the sheets being the only points of adhesion.

Lead Bands Burned On

First the surface of the tank was cleaned by grinding. Then the outside of the shell was preheated opposite the narrow strips that were to be coated to form the bands, and the skin base was applied. Then the bands were burned on. The bands are on 15-in. centers on the upper half of the tank and on 30-in. centers on the lower half.

Sheet lead ⅛ in. thick, which is used for the lining, was cut to the proper width to butt against the sides of the bands. The edges of the sheet were then burned to the bands, seams ¼ in. deep being made at the point of contact, assuring a strong adhesion of the sheets to the bands. After the inner circumference of the shell was lined, the heads were lined with 3/16-in. sheet lead burned to vertical homogeneous bands 2 in. wide placed on 15-in. centers. After the heads were lined, they were riveted in position, and the ends of the sheet lead in the shell were lapped over the rivets and burned to the sheet lead in the head.

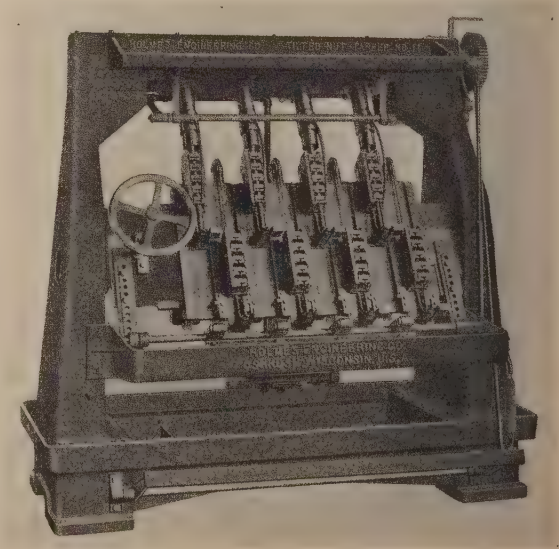
This method of lead lining, while regarded as satisfactory for tanks for certain uses, is not recommended where the working temperature inside the tank is 200 deg. Fahr. or higher, or in tanks in which a high vacuum is created.

The lead-lined tank cars are being built for the Champion Coated Paper Co., Hamilton, Ohio, for handling acids. This company's processes require that the acids inside the tanks be free from stains caused by iron and steel, and that the tanks be protected from corrosion.

Precision Claimed for Tilted Nut Tapper

THE Holmes Engineering Co., Oshkosh, Wis., has brought out a new tilted nut tapper with features intended to assure tapping square with the face of the nut. Precision is attributed to the 30-deg. tilt of the machine, which permits the nut to lie squarely on its face with no danger of tipping on its side. Secondly, the work-holding fixtures can be made absolutely true, are adjustable and can be lined up with the spindles. These fixtures are self cleansing, so that no chips can lodge at any point. The carriages are counterpoised to eliminate error in lead.

The capacity of the machine, which is designated as the No. 14, is for U. S. S. threads up to 1¼ in., and production is at the rate of 20 to 30 nuts per min. The machine may be arranged for belt or motor drive.

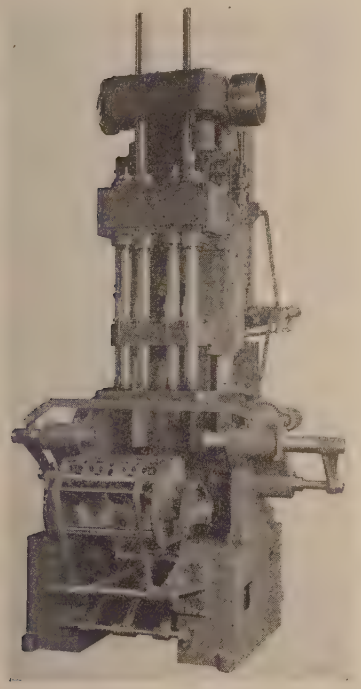


PRECISION Is Attributed to the 30-Deg. Tilt of the Machine, which Permits the Nut to Lie Squarely On Its Face. The adjustable fixtures can be alined with the spindles, and the carriages are counterpoised to prevent error in thread lead

Cylinder Borer for High-Production Operations

FOR high production on a definite set-up, the Moline Tool Co., Moline, Ill., has added to its line the No. 14 Hole Hog cylinder borer here shown.

The machine deviates from the company's standard practice of having independent spindle units adjustable for center distances between spindles. Timken roller bearings are used for the spindles, and all running bearings throughout the machine are either roller or ball bearings. The illustration shows the machine complete with jigs and tools for reaming a V-type eight-cylinder block.



Cylinder Borer Tooled for Reaming operation on V-type Cylinder

As in other Hole Hog boring machines, double-V guide construction is used, as well as the Oilgear feed mechanism, with the cylinder located between the vees and the pump inclosed in the column. From the motor, mounted on top of the column, the drive to the main driveshaft is through silent chain. The upper driving mechanism is fixed with respect to the column, the drive from the main horizontal driveshaft to the two vertical intermediate shafts being through hardened steel and bronze spiral gears that run in oil. The two vertical shafts are multi-splined, and on their ends are mounted hardened steel pinions that mesh with the gears on spindles. These gears are also immersed in oil.

The machines are made in pairs, two each for roughing, semi-finishing, and reaming operations, respectively, on the two series of holes. The fixture can be swung out in line with the conveyor so that the cylinder can be pushed into the cradle jig, and by very little effort in raising the lever at the front and center of fixture, the entire cradle swings into working position. By turning the crank at the right of the fixture, the two locating plungers enter the main crankshaft bearings, and simultaneously the two guide and clamp plungers are brought into position, centering and clamping the block in place.

In all cases, the boring bars are made as long as possible. In the roughing operation they are guided at the top of the fixture, close to the work, and in the semi-finishing operation are piloted both above and below the work. In the reaming operation the guide is mounted on the bottom of the slide and is not piloted directly in the fixture.

Punch Press for Large, Light Work

TO meet the demand for a punch press to accommodate large, light work that is usually handled on a heavier and slower press in order to get sufficient die space and bed area, the Federal Press Co., Elkhart, Ind., has brought out the new machine here illustrated. The press can also be used in the production of parts that require use of progressive dies, and has an opening in the bed which permits dropping through of stamped parts or the scrap from extremely long progressive dies.

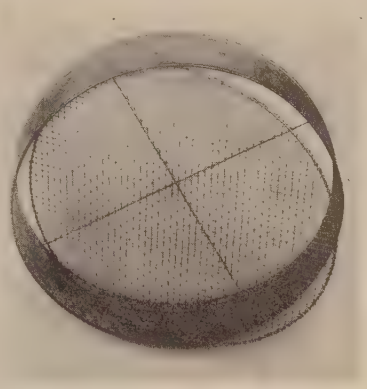
The die space, bed to slide, stroke down adjustment up, is 9¼ in. Approximately 2 hp. is required to drive the machine, which occupies 35 x 44¾ in. of floor space overall and weighs 3100 lb. complete.

Pressure exerted by the ram, near the bottom of the stroke, is 26 tons. The standard stroke is 1 in., but a stroke of 1½ in. can be provided. The size of the square hole, for round or square punch shanks, is 1 9/16 in. The depth of throat, ram center to frame, is 8¾ in., while the distance from bed to gibs is 13 in. The bed reclines 40 deg. from upright. The bolster plate measures 16 x 32 in. and is 1¾ in. thick. The flywheel is 27 in. in diameter, weighs 450 lb. and has a speed of 125 r.p.m. The crankshaft diameter is 2¾ in. at the main bearings and 3 in. at the crank bearings.

For preheating sheet mill rolls at the new works the Newton Steel Co. is building at Monroe, Mich., 24 electric roll heaters will be supplied by the Freyn Engineering Co.

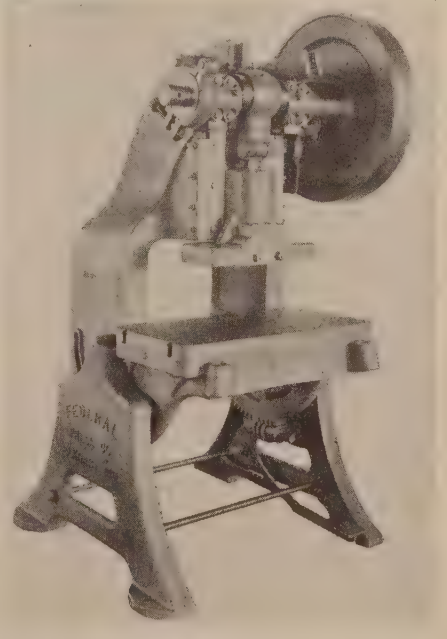
Foundry Riddle with Metal Rim

METAL-RIM riddles with removable bottoms have been brought out by Rolock, Inc., Southport, Conn., as illustrated. The greatest field for this riddle has been found in connection with the use of gyratory machines. Here it is possible to slip out a used bottom and replace it with a new one in a few seconds, instead of taking considerable time to remove the complete riddle, as formerly was necessary.



Separate Bottom with Metal Rim Makes This Riddle Easy to Replace in a Gyratory Machine

Stocking of riddle bottoms of different meshes is facilitated in a minimum of space by the fact that the bottom and rim are separate. There are three sizes made, one for the gyratory machine, the others being 16 and 18 in. in diameter respectively.

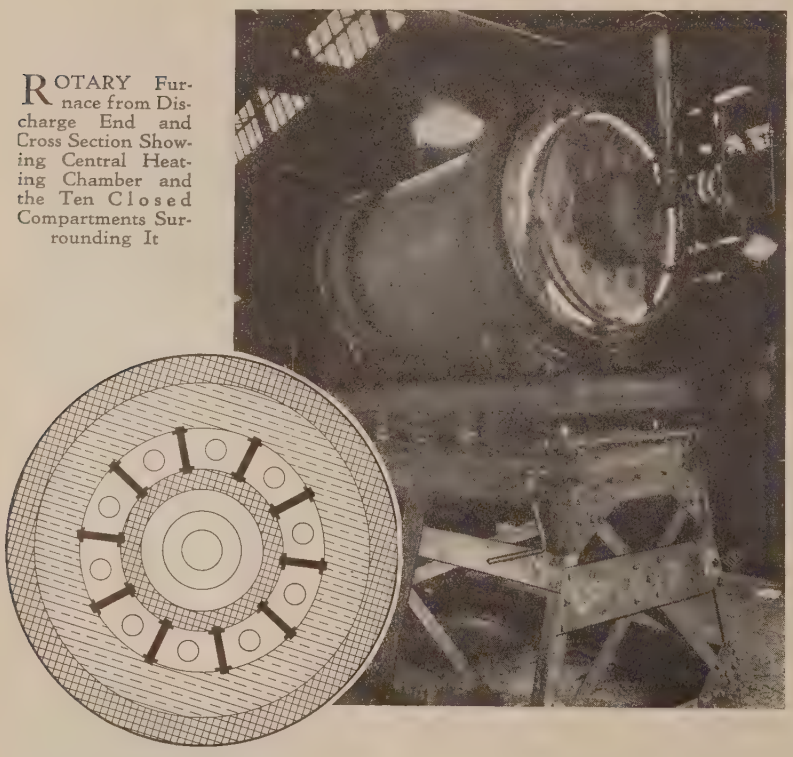


Press Designed for Production of Light Material of Large Size and Parts Requiring Use of Long Progressive Dies

Multiple-Hearth Rotary Furnace

Central Heating Chamber Is Surrounded by Ten Compartments for Holding Work

A ROTATING furnace for bluing, drawing, annealing and heating at temperatures from 700 to 1650 deg. Fahr. has been brought out by Strong, Carlisle & Hammond Co., Cleveland. The furnace illustrated was built for heating 1½ x 2½-in. brass billets, and has a capacity of 20 lb. per min., work heated to 1300 deg. Fahr.



ROTARY Furnace from Discharge End and Cross Section Showing Central Heating Chamber and the Ten Closed Compartments Surrounding It

As shown by the cross sectional drawing, a combustion chamber 12 in. diameter, made of Carbofrax, extends down the center. Surrounding the chamber is an annular space in which the work is carried. This is divided into either 8 or 10 compartments by ½-in. partitions of heat resisting alloy. Work is thus carried through a revolving barrel and is brought to temperature by radiant heat, not coming in contact with the products of combustion.

One of the compartments is used for a thermocouple, this section being inclosed at the feed end so the work will not enter. The thermocouple wires connect to the two brass rings shown in the view of the discharge end of the furnace. Contact brushes lead to a temperature recorder.

The outer wall of the heating chambers is built of 4½-in. Klondyke firebrick, surrounded in turn by insulating material; outside is the steel drum which forms the outer covering of the furnace.

The furnace barrel and drive is mounted on a frame, hinged to the structural steel base at the loading end. This permits the drum to be set at any desired incline by lowering the discharge end with the hand crank. The rate at which the work moves through the furnace, and consequently the heating time, is controlled by the inclination of the barrel axis and by the speed of the driving motor. The heating time can be varied from 5 min. to a maximum of 30 min.

Work is fed into the furnace by an elevator conveyor dumping into a hopper. Mechanical pickers carry the work from the hopper into the heating sections. As the drum rotates, the work not only moves toward the discharge end but is carried around on the hottest side of the chamber.

Work is discharged from each compartment through ports in the circumference of the cylinder; it drops into a two-way spout leading into either a water or oil quenching tank. Encircling these ports, except at the discharge point at the bottom of the furnace, is a fixed tubular ring which serves as a cover for the ports except at the discharge point, and also as an air preheating chamber, furnishing air to the burner at 150 to 200 deg. Fahr.

New Type of Heating Radiator

STEEL or copper fins welded on pipe have been made into a new type of heating unit by the Richmond Radiator Co., 1480 Broadway, New York. Known as the Richmond Floorline radiator, the unit is light and easy to handle. It is made 8½ in. high, 3½ in. thick and either 36 or 18 in. long, and occupies little room.

Units may be installed separately or they may be joined end to end or placed one above the other, in providing desired amount of radiation surface in any locality. Because of its low position, this radiator gives heat near the floor. It has been tested for efficiency and rating by the Frost Research Laboratory, Norristown, Pa., and by S. E. Dibble, professor of heating and ventilating, Carnegie Institute of Technology, Pittsburgh. The tests were made on a 30-in. section equivalent to 15 sq. ft. of cast iron radiation, according to the code of the American Society of Heating and Ventilating Engineers.

Specific Savings from Use of Skid Platforms

USE of skid platforms with electric lift trucks has given manufacturers and shippers large savings in time and in labor costs of handling, according to a statement from the Transportation Division of the Department of Commerce. Several instances cited in substantiation of the statement follow:

An automobile manufacturing company formerly unloaded crankshafts from a car by hand, requiring eight men for 7½ hr. at a labor cost of $24. When skid platforms and lift trucks were substituted for the old method, one driver and one helper could unload a car in 45 min., at a labor cost of 98c.

A railroad in the West reduced the labor payroll in the storekeepers' department over $15,000 a month by this means. Analysis disclosed a reduction in handling brakeshoes from 175 manual operations to seven; in handling brake beams, from 200 operations to 10.

One concern last year is said to have given to its customers without charge 4000 skids, at a cost of about $10,000. Its return came from a saving of considerably more than this amount, in stevedore payroll, from the use of the skids by the customers.

Loading a 50-ft. box car with paper by the old method took seven men in a paper company 3 hr. This is now accomplished on skids by two men in 45 min., representing a labor saving of 93 per cent.

August Exports Smallest of Year

Imports Largest in 3 Years—Eight-Month Exports 11 Per Cent Above Last Year, Mostly in Rolled and Finished Steel

WASHINGTON, Sept. 27.—Making a decrease of 27,676 gross tons, exports of iron and steel products from the United States in August totaled 242,856 tons, against 270,532 tons in July. In August of last year they aggregated 287,297 tons. For the eight months ended with August, they were 2,105,227 tons, an increase of 207,163 tons over the corresponding period of last year, with a total of 1,898,064 tons. The daily average for August was 7834 tons, compared with 8727 tons in July.

August exports were the smallest for any month so far this year, while scrap exports were the largest since August, 1928.

In contrast to outgoing shipments, imports in August, amounting to 83,969 tons, the largest since September, 1926, showed an increase of 12,591 tons over the 71,378 tons imported in July. Imports in August of last year were 76,172 tons. For the eight months of 1929 they were 513,192 tons, a decrease of 10,635 tons from the 523,827 tons imported in the like period of 1928. The daily average of imports in August was 2708 tons, compared with 2302 tons in July.

Scrap formed the largest item of exportation in August, reflecting an increase of 15,839 tons over that shipped abroad in July, but this gain was more than offset by a number of declines. Among the decreases were steel bars, which dropped to 11,936 tons from 17,183 tons; wire rods, decreasing to 2969 tons from 5822 tons; plates, decreasing to 13,924 tons from 19,675 tons and making the lowest total since last September; galvanized sheets, falling to 11,336 tons from 14,154 tons; black steel sheets, dropping to 15,890 tons from 18,259 tons; black and galvanized welded pipe, decreasing to 11,497 tons from 14,880 tons; and, the greatest decline of all, plain structural material, only 5278 tons, compared with 29,946 tons. Structural material, plain and fabricated, made the smallest total since September, last year; with that exception, the smallest since February, 1928.

The more important gains, in addition to scrap, were in tin plate, rising to 21,367 tons from 16,875 tons; fabricated material, increasing to 12,647 tons from 10,392 tons; and steel rails, which rose to 12,926 tons from 9999 tons.

Of the steel bars exported in August, 5556 tons went to Canada, 2611 tons to the United Kingdom and 1276 tons to Japan. Canada took 3473 tons

of plain structural material and 4035 tons of tin plate. Exports of tin plate to Japan were 4734 tons, while 3095 tons went to China. The great bulk of plates was shipped to Canada, that country taking 11,914 tons. It also led in rail shipments, taking 3190 tons; Brazil taking 2565 tons; Chile, 1710 tons; the Philippine Islands, 1475 tons; and Japan, 1372 tons.

Exports to Canada amounted to 35 per cent of the August total, while Japan took 17 per cent. Exports to Canada during the eight months of the current year were 879,228 tons, as against 729,191 tons for the corresponding period of last year, a gain of more than 20 per cent.

The largest item of importation in August was structural shapes, of which 6906 tons came from Germany, 6255 tons from Belgium and 2311 tons from France. Of the hoops, bands and cotton ties imported in August, 5433 tons came from Belgium and 1073 tons came from France. France supplied 6429 tons of the cast iron pipe, and 1945 tons came from Belgium. Sweden furnished 1412 tons of the steel bars imported, and 1351 tons came from Belgium. Canada supplied 11,490 tons of the scrap importations.

Norway was the source of 4378 tons of ferromanganese importations, while 2357 tons came from Canada and 1509 tons from the United Kingdom. Of the manganese ore imported, 24,843 tons came from Soviet Russia, 5696 tons from Brazil, 1520 tons from India and 884 tons from Chile.

Belgium led as the source of August imports, supplying 18,131 tons; 16,648 tons, an unusually high total, came from Canada; 14,225 tons from Germany and 11,423 tons from France.

Chilean Steel Industry to Have Government Support

The project to establish an iron and steel industry in south central Chile appears to be nearer realization with the passing of a law by the national Chilean Congress authorizing the President of the Republic to subscribe on account of the State the greater part of the shares, the total of which will amount to about $7,260,000, and to assume an active part in the organization and administration of the company, according to a report from Vice-Consul Comden L. McLain, Concepcion, Chile.

The initial project to manufacture iron and steel in the country began in 1905, when the Government granted a French company, the Sociedad Altos Hornos de Corral, a concession to exploit a large timbered tract in the vicinity of Valdivia and to construct a blast furnace at Corral. This plant was partially completed in 1910 at a cost of 14,700,000 pesos ($3,381,000), and in 1911 some 4000 tons of iron was manufactured.

Since that time the furnace has been closed, due principally, it is stated, to the impracticability of the Prud'homme system of ore reduction as applied at Corral. Subsequently the iron ore supply of the company in northern Chile was sold and in 1924 a group of industrialists at Valdivia organized a company under the name of Compania Electro-Siderurgica y Industrial de Valdivia and purchased the remaining property of the Sociedad Altos Hornos de Corral. The Government again offered generous aid (under Law 4110 of Dec. 28, 1926), but the problems surrounding the establishment of the industry on a sound basis appeared to be too great.

Former Munitions Plant to Make Track Material

HAMBURG, GERMANY, Sept. 16.—The former Government munition works at Spandau will start production of open-hearth bolts, rivets, spikes and other track material soon after Oct. 1. The plant will have an annual capacity of 150,000 tons and will be one of the most modern steel plants in Europe. Labor-saving devices have been installed throughout. In the bar mill, where output will be handled by a minimum of men, production per capita is expected to be the largest for any mill in Germany. The principal raw material used will be steel scrap shipped to Spandau from the Berlin district.

The Rohrbachwerke A. G., German builder of flying boats, has organized the Metal Flying Boat Corporation, with headquarters in New York. The American company will shortly start the production of metal flying boats similar to those in service in Germany, which have a maximum capacity of 45 passengers.

Institute of Metals Visits Düsseldorf

British Foundrymen Inspect Iron and Steel Plants in the Ruhr— Germans Hold Foundry Exposition

(Special Correspondence)

DÜSSELDORF, GERMANY, Sept. 15.—Nearly 300 members of the Institute of Metals attended the annual autumn meeting at this place, and while most were from Great Britain, a considerable number came from other countries. The Association of German Iron Foundries and the Society of German Iron Foundrymen were also in convention, and at their invitation many of the visitors inspected the educational and foundry trade exhibition.

The Düsseldorf meeting was the first that a British engineering or metallurgical body had held in Germany since the war and it was one of the most successful international gatherings of recent years. In view of the importance of Germany as a competitor of Great Britain in the world's markets, it had a special significance, but the whole proceedings were conducted in an even more than friendly manner and the arrangements could not have been better.

The feature of the exhibition that impressed one most was that the scientific, or what may be termed the metallurgical side of foundry practice, was more in prominence than the plant or equipment side. The display of micro-photographic equipment, pyrometric instruments and laboratory equipment was in advance of either of the Paris exhibitions or the several British exhibitions that have been held in recent years. It may be admitted that the exposition was not of as great interest to practical foundrymen, because it is doubtful if the machinery and furnace sections were as good. A number of molding machines were on view of orthodox designs, including several American machines, in operation that were made under license by German firms. Handling and conveying plant were not much in evidence, although there was a model of the mold conveyor used at the Citroen foundries in France. It was also rather disappointing that the model foundry in the exhibition hall was not laid out on more modern lines for repetition castings.

Copper Castings Deoxidized with Beryllium

Oil-sand cores have become very popular in Germany, but the most interesting exhibit was comprised of a number of copper castings, homogeneous and sound in every way. As is well known, it has until recently been almost impossible to obtain castings of pure copper, but this has now become possible by the addition of a small percentage of beryllium, which acts as a deoxidizer.

Electric furnaces are not used to a considerable extent as melting units in European foundries even yet, but there were a number of high-frequency and induction furnaces on view. One of the most interesting exhibits in the hall was a cupola tapping device made by Werner Handelsgesellschaft, Düsseldorf. By means of a simple arrangement of levers and weights a conical plug is directed into the tapping hole; when iron is required the furnaceman pulls a lever and this withdraws the plug, and when the ladle has been filled he simply releases the handle and the plug swings back into place. This device should be useful in jobbing foundries and is a most simple and practical method of controlling the flow of metal.

Several works were visited by the members, including those of J. G. Schwietzke and August Thyssen. Schwietzke are non-ferrous founders; their equipment includes shaft furnaces with crucibles up to 1300 lb. capacity and oil-fired and gas-fired furnaces. The firm claims to be one of the largest and best equipped non-ferrous foundries in Germany, comparable with large foundries in shipbuilding centers in England, and is well organized for production and has a very well equipped laboratory.

Steel and Iron Plants Visited

At the August Thyssen works a feature is a special type of blast furnace with an elaborately constructed charging gear. Steel castings are the specialty, but while many castings were examined closely by the visitors at both these works and, later, at the Krupp works at Essen, they seemed to be as good but no better than those obtained in British steel foundries.

Doctor Lehr, Lord Mayor of Düsseldorf, impressed his guests with the growing importance of Düsseldorf as an industrial center. The most important industry is the manufacture of iron, steel and other metals in all forms, while the heavy industries are chiefly concerned with the manufacture of semi-finished iron and steel, rolled sheets and wire, tubes, cast and forged machine parts of all sizes, bridges and iron work.

Few Electric Furnaces in Continental Foundries

One of the most interesting papers read was on "Progress in Electric Furnaces for Non-Ferrous Metals," by a German member of the institute, M. Tama. An American visitor contributed some interesting remarks to the discussion on this subject in regard to the use in the United States of the electric furnace for annealing purposes and also for electric carbonizing. The question of heat treating aluminum castings and forgings was also discussed, and the statement was made that in the Birmingham area, which is the largest non-ferrous district in Great Britain, electric melting had increased in recent years.

Krupp Plant Roomy and Clean

On the last day of the conference the members visited the Krupp works at Essen. At the present time the Krupp firm employs altogether about 70,000 people, 30,000 of whom are at Essen. It is a remarkable achievement that, apart from the shipyard at Kiel, the Krupp company's manufactures have been almost entirely changed since the war. All kinds of machinery, including agricultural, are made by the firm. The blast furnace plant is up-to-date, comprising 10 blast furnaces and two special furnaces for various classes of high grade ferromanganese and ferrochromium. The coke oven plant at the works, comprising 175 ovens, produces approximately 1700 tons of blast furnace coke per day, but much additional coke is required. There is an up-to-date by-product plant at Essen and most of the pig iron produced by the blast furnaces is utilized in the steel works after it has passed through two 900-ton mixers. Essen possesses 14 rolling mills, viz. three heavy blooming mills, four roughing, three intermediate and three finishing mills, together with a wire mill. Additions have recently been made to the blast furnace plant and hydraulic press plant. In the steel foundries castings are made from the smallest to the largest sizes. A feature of the whole works is the excellent lighting and ventilation.

It is but fair to say that while Krupps have shown great enterprise in turning their attention to peace manufactures, their general works practice appears to be in no way exceptional. In the laboratories, testing methods do not seem to be ahead of those in general use in England and America; in some cases the analytical methods are distinctly older than those used by many steel and iron firms. The firm was particularly hospitable to the visitors and afforded them every conceivable facility for obtaining information of an exact kind about the organization, methods and equipment of the works.

Meeting of Drop Forging Association

Costs, Market Research and Broad Future Developments Among Topics of Last Week's Convention

THE American Drop Forging Institute held a meeting at the Buckwood Inn, Shawnee-on-Delaware, Pa., Sept. 25, 26 and 27. It listened to a number of scheduled addresses on Wednesday and Thursday mornings, devoted itself to a discussion of costs and cost finding under the direction of R. T. Herdegen on Friday morning, played golf in the afternoons and banqueted Thursday evening, with L. W. Greve, one of the directors, presiding as toastmaster. Charles H. Smith, Steel Improvement & Forge Co., Cleveland, secretary-treasurer of the association, was executive officer of the convention.

President A. C. Johnson, secretary, Rockford Drop Forge Co., reported on the progress of the association. Two of the technical papers had to do (1) with the inclosed fan-cooled motor for the forge shop, presented by A. M. McCutcheon, Reliance Electric Co., Cleveland, and (2) with steam generation and steam consumption, presented by Harold F. Wood, Wyman & Gordon Co., Harvey, Ill. Dr. Zay Jeffries, United States Aluminum Co., gave an inspirational and informative address, outlining what is going on in the scientific world and what is shaping up by way of applications that are likely to have far-reaching effects on social as well as industrial progress.

Charles F. Abbott, executive director of the American Institute of Steel Construction, New York, under the title of "Rationalizing Output," made one of the principal addresses, which in part covered the following:

Value of Market Research

The principal problem confronting most industries at the present time is that of the market. In most cases the application of research by an organized industry would develop new practical uses for a product and at the same time locate new opportunities for extending present markets. Steel plate floor construction, the use of steel in dams, in airports and hangars and in residences, all represent the result of concerted research to locate and develop new uses for the structural steel industry.

When we suggest research for an industry we should not expect immediate results. It is no assured talisman, for results will depend upon how research is conducted. In order that it may be productive of good for the industry as a whole, it must be carried on by the industry and not left to a single company. In that case the industry will profit through impartial investigation while, when in the hands of a single corporation, the benefits must of necessity be selfishly applied and selfishly circumscribed.

It is too bad that some money-making and money-saving methods are called "research." The word calls up visions of high-brow investigations by expensive experts. "Research" has a scientific sound. An ordinary business man is scared by it; in fact, he may think trade research is theoretical and academic. He turns impatiently from it to his rule of thumb practices—which sometimes lead him to bankruptcy.

Research improperly applied may prove an industrial waste. Dr. Julius Klein, assistant secretary of commerce, holds that between eight and ten billion dollars annually is chargeable to waste in the conduct of business in America. This waste about equaled the value of all our foreign trade in 1928. Waste occurs through excessive expenditures in sales promotion, unwise credit methods, disorderly marketing, extravagant delivery services, ill-judged advertising, etc.

Research may be just as successful in the market place as in the laboratory. Often the opportunities of research are lying beneath our noses unnoticed, and that is what makes business opportunities so plentiful, and why it is always unwise to depreciate the efforts of even the smallest competitor. In cooperative effort we profit by bearing each other's burdens as well as in sharing each other's benefits.

Steel Merger Plan Approved

Hanna, Weirton, Great Lakes Holding Company Ratified—To Be Called National Steel Corporation

THE Hanna-Weirton-Great Lakes Steel merger became effective Oct. 1, following the approval of the terms of agreement by stockholders of affiliating companies, the Weirton Steel Co., Weirton, W. Va., Great Lakes Steel Corporation, Detroit, and the M. A. Hanna Co., Cleveland. The merged properties include the steel plants of the Weirton and Great Lakes companies and the blast furnaces, ore mines and vessel interests of the Hanna company.

The holding company that will control the merged properties will be known as the National Steel Corporation. This will be a Delaware corporation and will have an authorized capitalization of 3,000,000 shares of no par common stock, of which 2,080,000 will be issued at present and distributed to stockholders of the merged companies on the following basis:

Weirton stockholders will receive 1,120,000 shares or 4.7 shares of the holding company in exchange for each share of $100 par value Weirton stock. Hanna stockholders wll receive 560,000 shares in exchange for shares of stock of the Hanna subsidiaries. Great Lakes stockholders will receive 400,000 shares in even exchange for each full paid share of that corporation's no par common stock. In addition they will receive warrants entitling the holder to purchase an additional one-fifth share on or before Dec. 31, 1929, at $62.50 a share and warrants for the purchase of an additional one-fifth share on or before Oct. 1, 1934, at the same price.

George R. Fink, president of the Great Lakes Steel Corporation, who under an organization agreement with that corporation was given the right to subscribe within five years to 20,000 shares of common stock of Great Lakes at $50 per share, is given the right to purchase an equal amount of stock of the new corporation at $50 a share on or before Oct. 1, 1934.

Management of the holding company will be under the direction of E. T. Weir, president, Weirton Steel Co., as chairman of the board, George M. Humphrey, president of the M. A. Hanna Co., as president of the executive committee, and Mr. Fink, who will be president of the holding company. These three executives comprise a committee that is authorized to determine the form of articles of incorporation of the new company and to draw up by-laws and carry out other details that may be required to place the merger in effect.

Simplified Practice on Several Products

Elimination of waste through simplified commercial practice has been carried by the United States Department of Commerce into welded chain, sheet steel and grinding wheels, which form the subjects of recent practice recommendations issued by that department. The welded chain specifications are carried in recommendation R100-29, which lists the sizes and types of chains eliminated in making up the simplified list. The recommendation is subject to annual revision by those interested.

Sheet steel, covered in recommendation R28-29, shows in tabular form the sizes of sheets of various gages adopted by the simplification conference. These include galvanized flat sheets, one-pass cold-rolled box annealed sheets and blue annealed sheets. Grinding wheels are covered in recommendation R45-28. The types which have been adopted as standard are illustrated and are covered in tabular matter giving standard dimensions and other particulars.

To Trace Migration of Industry

Idle Power Equipment Also to Be Studied in Census of Manufactures for 1929

WASHINGTON, Oct. 1.—The census of manufactures for 1929 will include data showing the trends of industrial migration and the idle power equipment of the United States. This will be the first time such information has been gathered. It is also the purpose to tabulate the schedules, which will go out next January to every manufacturer in the country, as speedily as possible. Plans for the census have been made public, following the report to Secretary of Commerce R. P. Lamont of the Advisory Committee on Manufactures under the chairmanship of Col. L. S. Horner, president, Niles-Bement-Pond Co.

This report stated that the basic thought in mind is that the information will be of real practical value, directly or indirectly, to manufacturers in their studies of production and distribution problems. Data which do not fall under this general heading have been eliminated, and new material of large practical value will be requested for the first time from manufacturers of the country.

Movements of Industrial Plants

It is the underlying purpose to tabulate data furnished by manufacturers in such a way as to point out the most significant industrial trends. Among these trends is that of migration of industry. Large movements of industry have been under way, especially since the World War, the advisory committee reported.

Some of these movements have involved the transfer of thousands of employees from one section of the country to the other, and have entirely changed the industrial occupation of a large portion of the inhabitants of these sections. The textile industry was pointed to as being an outstanding example of such migration. In other cases, it was stated, there has been a distinct drift by manufacturers away from urban communities into the smaller towns.

Again, a tendency toward concentration of certain industries has been prevalent, while other industries have tended to spread throughout the country. All of these trends have been recognized by the committee as having a large influence on the employment phase of industry. It has been generally known that such trends are under way, but definite data are not available.

Much Power Equipment Is Idle

The amount of idle power equipment in the manufacturing plants of the country will be ascertained for the first time. Estimates have been made that as much as 50 per cent of the installed power practically is idle through obsolescence, over-capacity or other causes. Specific information, however, on this significant subject has never been made available from any source. Power installation was referred to in the report as one of the best possible bases for industrial market studies. But the inaccuracy of available data due to the inclusion of this large amount of idle power equipment has deprived such studies of much of their potential value.

The Census Bureau is making special efforts to get the statistics on manufacturing operations back to the manufacturers at as early a date as possible. Realizing that an early report from manufacturers is dependent largely on the interest they manifest in making early returns, the advisory committee has appointed a publicity committee composed of Robert M. Davis, McGraw-Hill Publishing Co., chairman; Dr. H. P. Baker, Chamber of Commerce of the United States, and Dr. Roland P. Falkner, National Industrial Conference Board. This committee will bring the census of manufacturers to the attention of manufacturing executives in a positive way in the next few months through radio and press and by addresses before trade organizations.

Members of the publicity committee are also members of the advisory committee. Among additional members of the latter committee are Charles F. Abbott, American Institute of Steel Construction, New York; George G. Crawford, Tennessee Coal, Iron & Railroad Co., Birmingham, Ala.; Walter S. Tower, Bethlehem Steel Co., Bethlehem, Pa.; Clarence M. Woolley, American Radiator Co., New York; J. E. Edgerton, National Association of Manufacturers; Virgil Jordan, late of the National Industrial Conference Board, and now with *Business Week*, New York, and F. M. Feiker, Associated Business Papers, Inc., New York.

New Bolt and Nut Plant on Pacific Coast

PACIFIC COAST STEEL CO. has added a plant at its South San Francisco, Cal., works for the manufacture of bolts, nuts, rivets, cap screws, track spikes and kindred products. Capacity is 1200 tons a month.

Equipment includes two continuous and four hand-fed National hot bolt machines; three National hot nut machines; three cold press nut machines and two cold trimming machines, built by the Waterbury-Farrel Foundry & Machine Co.; 15 automatic Economy Engineering Co. threaders; three Landis Machine Co. automatic threaders; four Landis and two Holmes hand threaders; two Waterbury-Farrel hand roll threaders; three National burring machines; five National pointers; one National flash trimmer; two National spindle tappers, 15 National automatic cappers.

Bolt rod used is high tensile steel manufactured by the company. Heat treating facilities with automatic temperature control are provided. For heat treating the cold-headed product a Westinghouse electric rotary-hearth normalizing and heat treating furnace has been installed.

All machines are individually motor driven and every motor is remote controlled.

The new plant is a one-story steel frame structure, 180 x 540 ft., composed of two bays, each 90 ft. wide, and is sheathed and roofed with corrugated sheet steel. About 60 per cent of the wall area is glass, insuring natural illumination throughout the building. Each bay, throughout its length, is served by a 10-ton electric traveling crane. The building, exclusive of equipment, cost $120,000.

British and German Metallurgists Meet

Keynote of Düsseldorf Meeting Is Improvements in Production of Light Metals

DÜSSELDORF, GERMANY, Sept. 15.—The joint meetings of the British Institute of Metals and the Deutsche Gesellschaft für Metallkunde were held here from Sept. 7 to 13, at the invitation of the German institute. Papers were presented by members of the German organization during the first half of the week and by members of the British Institute of Metals in the latter part of the week. Certain of the German metallurgists read their papers in English, but the principal papers, which were presented by Dr. A. G. C. Gwyer and by Dr. W. Rosenhain, president, British Institute of Metals, were in German.

A total of 39 papers were read during the seven days of the meeting, of which 18 were submitted by members of the Deutsche Gesellschaft für Metallkunde. During the convention members of the two institutes visited the Kaiser Wilhelm Institute for Steel Research, attended the foundry exhibition and visited the J. G. Schwietzke Metal Works, Demag A. G. of Benrath, Duisburger Kupferhütte and the works of the Friedrich Krupp A. G. at Essen, where they inspected the departments producing Nirosta steel and Widia metal. Members of the British institute were guests of the German association at a dinner on the Rheinterassen in Düsseldorf, and there were excursions on the Rhine.

Improved Light-Metal Alloys

The keynote of the papers presented was improvement in the production of light-metal alloys. Doctor Rosenhain, president of the British Institute of Metals, discussed the importance of absolutely pure metals for the physicist and explained that pure zinc, iron, manganese and chromium have shown surprising results in tests of their physical properties, especially after heat treating. Absolutely pure metals show considerable resistance to oxidation and corrosion and offer the physicist such a wide field of research that the metal industry should begin to consider their production as of great importance. Doctor Rosenhain pointed out particularly that metal research is now devoting more attention to the interior structure of metals, studied by the X-ray. The physical properties of metals, he said, are not only dependent upon the alloy itself, but even more on the form of the interior structure, and there is the possibility of influencing the structure of the crystals through special methods of treating.

Aluminum Alloy Treatment

Dr. A. G. C. Gwyer, prominent in England for his research in the field of aluminum alloys, predicted that the present knowledge of aluminum alloys will be greatly altered through current investigations of their reactions under heat treatment. In the past, effort has been directed toward obtaining certain physical properties in aluminum alloys by changing the composition of the alloy, with additions of copper, zinc, lead, lithium or manganese. Special methods of heat treatment, however, promise far better results, especially with X-ray spectography.

Considerable interest was shown in a paper on magnesium-zinc-aluminum alloys, presented by Dr. G. Wassermann of Berlin. He said that the possibilities of such alloys have been carefully investigated for the first time and it has been found that magnesium promises to give especially good results where unusually high tensile strength and favorable elongation, not as yet found in other light-metal alloys, is required.

Aluminum Cable Used in Europe

As invited guests, Dr. A. Von Zeerleder and P. Bourgeois of Neuhausen, Switzerland, submitted a paper discussing the influence of temperature on cables in the open air. The paper largely dealt with the recently developed aluminum alloy "Aldrey," which is beginning to be used extensively in replacement of copper wire for cables in Continental countries. Its electrical conductivity is only 14 per cent less than that of copper. It is lower in cost and, of considerable importance, is but little influenced in its conductivity by current transmission or the heat of the sun. Copper cables, the paper pointed out, are affected both by the current and the sun's heat. As a result, it is possible to use a much higher electric tension with the aluminum alloy than with copper. It was noted that Swiss, German, Austrian, Italian and other telegraph companies are now installing the aluminum alloy cables.

Beryllium as Aluminum Alloy

A paper by Dr. I. N. Friend of Birmingham, England, called attention to recent advances in preventing corrosion in non-ferrous metals, and said that it appears certain that it will be easier to solve the problem of corrosion in non-ferrous metal products than in steel. He suggested that it will be possible in the future to produce corrosion-resisting non-ferrous metals with the physical properties of steel at lower costs than steel alloys. The future use of beryllium lies not so much in steel as in aluminum, according to Dr. Ing. Denzo Uno of Aachen. Experiments, he said, have shown that beryllium - aluminum alloys, when properly treated, lend themselves to wide use in the electrical industry, especially for the production of electric lamps.

The bending properties of galvanized steel products depend entirely upon the thickness of the zinc coating, said Dr. Heinz Bablik of Vienna. The lighter the coating the better the bending properties. Zinc should merely cover the steel, he said, and the area where zinc is fused with steel should be as thin as possible. To accomplish this, electrolytic zinc is most suitable, he declared. This was confirmed in the discussion which followed.

Other papers read included "Heat Treatment of Copper-Zinc Alloys," by M. Hansen; "Elongation of Aluminum," by Chevenard; "Crystallization of Iron and Copper Alloys," by Brenthel. During the meetings the British Institute of Metals elected Professor Thammann of Göttingen an honorary member.

"Pittsburgh's Preeminence in Steel Will Endure"

—C. M. Schwab

That Pittsburgh's preeminence in the world's iron and steel industry will endure for at least another century was the prediction of Charles M. Schwab, chairman of the Bethlehem Steel Corporation, in a talk on Sept. 26 at a house-warming of the Chamber of Commerce of Pittsburgh in its remodeled and enlarged quarters.

"Prophecy is a dangerous thing," said Mr. Schwab, "but I feel that Pittsburgh is going to be the greatest center for iron and steel for all time. I see no reason now for any prediction other than continued prosperity over the country with constantly good business for Pittsburgh, the city where I made my start in the steel industry just 50 years ago."

Speaking before an audience of Pittsburgh business men, many of whom he had known in the steel industry before the turn of the century, Mr. Schwab pointed out that Pittsburgh, because of its steel-making traditions and because the making of steel is in the blood of the people, need have nothing to fear from competitive centers. He traced the history of steel-making in the United States and pointed out that he had been ridiculed a few years ago for predicting that steel production in this country would reach 50,000,000 tons annually. Now, he pointed out, this figure is being exceeded by 4,000,000 or 5,000,000 tons.

Among those on the committee to welcome Mr. Schwab to Pittsburgh were Willis L. King, vice-president, Jones & Laughlin Steel Corporation; George M. Laughlin and T. M. Girdler, respectively chairman and president of that company, and J. M. Lind, president, Carlem Engineering Co. Mr. Girdler was toastmaster at the dinner.

An annual vacation of one week with full pay granted all factory employees by the Mathews Conveyer Co., Ellwood City, Pa., has proved beneficial, according to F. E. Moore, president, who states that each man seems happier and is showing more efficient workmanship as a result of the plan, which became effective during the past summer.

Charles M. Schwab Honored for Service

Directors of American Iron and Steel Institute Present Him with Clock as He Enters Fiftieth Year in Industry

DIRECTORS of the American Iron and Steel Institute, meeting at the Metropolitan Club, New York, Sept. 20, presented a gold folding desk clock to Charles M. Schwab, in commemoration of his entry into the fiftieth year of service in the iron and steel industry. The clock, which is a minute repeater with a radium dial, bears the initials, C. M. S., on the back and the following inscription on the base:

Charles M. Schwab
from
The Directors
of the
American Iron and Steel Institute
To Commemorate
Fifty Years of Constructive Service
in the
Iron and Steel Industry

James A. Farrell, president, United States Steel Corporation, made the presentation address, which follows:

Mr. Schwab, in behalf of your colleagues and fellow members of the directorate of the American Iron and Steel Institute on this occasion, we wish to offer our congratulations and best wishes to you upon your entry into the fiftieth year of your active association and leadership in the American iron and steel industry.

Your prominence in the steel industry has been universally accorded to you. You have risen to it solely through natural ability and application. You have had the distinction of being awarded the Bessemer Medal and many other honors of note.

This moment moves me to happy memories. Because of your genial nature and our many years of intimate friendship, we beg your indulgence for the unalloyed words of appreciation and praise which we now bestow upon you.

Back of every worthwhile deed of any man is the propulsive power of heart interest, something of which we think much, but seldom talk over with friends who have the same conviction. Nothing can endure unless it touches the sources of genuine heart sincerity, for "as we are sincere, so are we perfect," said one of the greatest of ancient philosophers.

In this moment of retrospection of the incidents and associations with Charles M. Schwab, which reach to the very depths of our hearts, it is difficult to find words adequate for expression. To be actively identified with a major industry of this country for 50 years is indeed an inspiring and outstanding chapter in the annals of human existence and endeavor.

Since the eventful day of Sept. 12, 1880, when you first applied for a job in the steel mills at Braddock in your home State, I have, with others, as a co-worker and colleague, had the good fortune to follow your advancement and your unceasing devotion and labor for the upbuilding of the steel industry of the United States.

Your march of progress to world recognition has been replete with action and history that will probably

CHARLES M. SCHWAB

never come to any other man. Your optimism has added color to many a drab day of life for those who know you best, and has been the incentive for others to work to the goals of success and to find happiness and contentment in their chosen vocations. Your influence has, like bands of steel, gripped the heart and soul of many young men also fired with an ambition to succeed in business. Many of your early and present co-workers will gladly testify that you put romance in work and magic in their everyday existence.

In the phase of management, you have contributed the factor of sentiment and the desire to consider the welfare of the worker and the entire industry as an art. You have tried to understand all people, large or small, progressive or conservative. In your work, you have not belonged to any particular locality, although we are well aware of your attachment to the Keystone State and its western hills and valleys.

In your vigorous career, you have seen not only our basic industry develop from an infant to one of important magnitude, but have seen others born and perfected, the possibilities of which we hardly dreamed of in the old "puddling" days.

You have also experienced, at first hand, the distress of modern warfare. With a keen sense of public obligation and putting other ambitions aside in order to serve your country, you played a mighty rôle in supplying the necessities of war. With our nation drawn into this conflict you, through force and personality, pointed the way of work and loyalty to a multitude of men in the shipbuilding industry, which has forever stamped you as an outstanding leader and a citizen whose usefulness can be measured only in terms of unbounded appreciation.

Your contribution of untiring energy and scholarship to the American Iron and Steel Institute is too well known throughout our land for me to comment upon it. Under your presidency it will continue to grow in quantity and quality, and we hope that you will be spared for many years to come to sound semi-annually to its members the keynote of our manufacturing progress and principles.

We fully realize that the greatest compensation which can come to you is the knowledge and assurance that you have the good-will of every member of this institute and your fellow directors. Our appreciation of your administration is unbounded, because of what it means to the progress of this country and the affairs of the world.

As our honored friend and member today, it is the desire of the directors of the American Iron and Steel Institute to have you carry away some visible evidence to commemorate your half century of service to the steel industry.

Acting in their behalf, it is, therefore, a happy privilege to present to you this clock, symbolic of the time and years you have labored with us, and the friendships that have survived the passing of time. May the memory of these friendships be a source of never ending satisfaction to you.

Technical Papers for Steel Institute's Fall Meeting

The thirty-sixth general meeting of the American Iron and Steel Institute will be held at the Commodore Hotel, New York, Friday, Oct. 25. There will be the usual technical sessions morning and afternoon, followed by a banquet in the evening. The technical program follows:

"Fatigue of Metals," by Prof. H. F. Moore, research professor of engineering materials, University of Illinois, Urbana, Ill.

"Thermit Welding and the Steel Mill," by J. H. Deppeler, chief engineer, Metal & Thermit Corporation, New York.

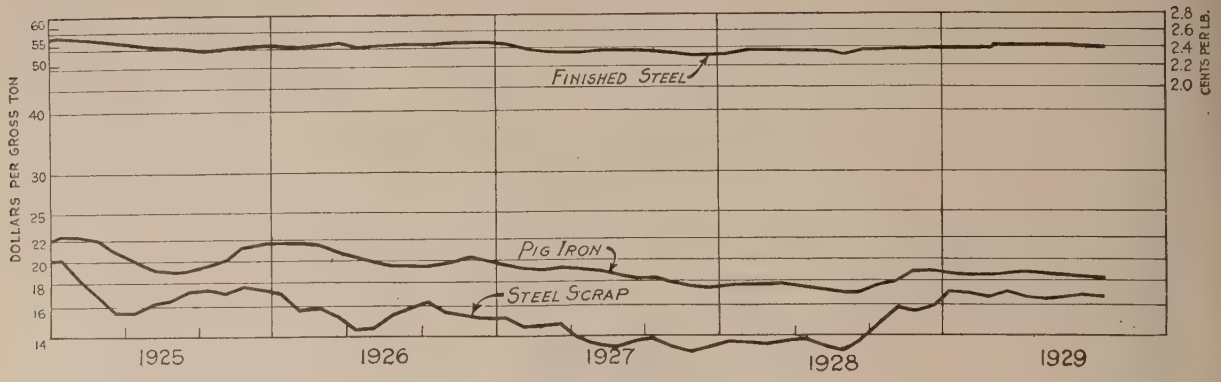
"Waste Prevention and Salvage as Applied to the Steel Industry," by Frank Parrish, supervisor of inventories, United States Steel Corporation, New York.

"Steel's Growing Service to Civilization," by E. F. Kenney, metallurgical engineer, Bethlehem Steel Co., Bethlehem, Pa.

"A Study of Basic Open-Hearth Slag by Solidification Tests," by E. J. Janitzky, metallurgist, South Works, Illinois Steel Co., South Chicago, Ill.

Latrobe Electric Steel Co. has moved its Cleveland office and warehouse from 1280 Ontario Street to larger quarters at 5140 Superior Avenue.

Scrap Prices Have Held Closely to Those for Pig Iron for Nearly a Year. By contrast, finished steel has had a narrow range over the past several years



Scrap Prices Have Moved Lower

Third-Quarter Average Is Lowest of Year—Spread Still Small Between Scrap and Pig Iron

AFTER a bulge in mid-August, prices of heavy melting steel scrap, averaged for Chicago, Pittsburgh and Philadelphia, have gone considerably lower, last week's level having been $16.33, against $16.92 prevailing through most of August. The latest average is exactly the same as that at the end of June and at the end of May, which is the lowest point that has been reached so far this year.

The trend of the year has been generally downward, maximum prices having been recorded at the end of January. The present level is $1.25 lower than eight months ago.

For the third quarter the average stands at $16.69, compared with $16.70 for the second quarter and $16.90 for the first quarter of the year. All three quarters this year have been at higher levels than have prevailed since 1925.

Meanwhile, the average price for pig iron has been lower, the general trend being downward since the second quarter. For the third quarter an average of $18.38 has been made, comparing with $18.62 for the second quarter and $18.39 for the first quarter.

Finished steel has taken a downward turn since early August, but the range since the middle of 1925 has been slight. For the third quarter the average is 2.403c. a lb., comparing with 2.412c. prevailing throughout the second quarter and 2.391c. throughout the first quarter. The current figures are not the lowest of recent years, as 2.318c. was registered in January, 1928.

A spread of $1.67 between scrap and pig iron in September may be compared with only $1.42 in January and February and with over $4 as recently as March, 1928.

Comparative figures for the past 21 months covering steel scrap, pig iron and finished steel are given in the table. The diagram carries the story of these changing prices over a period of nearly five years.

COMPOSITE PRICES

	(Gross Ton) Steel Scrap	Pig Iron	Finished Steel, Lb.
1925 average...	*$17.12*	*$20.58*	*2.465c.*
1926 average...	*15.48*	*20.42*	*2.439c.*
1927 average...	*14.00*	*18.55*	*2.357c.*
January, 1928 ...	13.70	17.63	2.318c.
February	13.71	17.73	2.361c.
March	13.65	17.73	2.362c.
April	13.81	17.67	2.359c.
May	13.90	17.45	2.350c.
June	13.52	17.23	2.341c.
July	13.13	17.10	2.325c.
August	13.75	17.11	2.348c.
September	14.75	17.54	2.348c.
October	15.85	17.94	2.363c.
November	15.73	18.46	2.368c.
December	15.97	18.51	2.385c.
Year's average.	*14.29*	*17.67*	*2.352c.*
January, 1929 ...	17.02	18.43	2.391c.

Largest Nitriding Furnace Is Now Operating

The Central Alloy Steel Corporation has completed construction and started operation of the largest nitriding furnace in the world at its Canton, Ohio, works, according to an announcement by F. J. Griffiths, chairman of the company. The new furnace will be utilized to promote the use of Nitralloy, one of the new alloys being produced by the company under Krupp licenses. Demand has doubled in the last few months and the corporation is now on a regular production schedule for Nitralloy.

The nitriding process is applied after the metal has been fabricated into the finished part, and the company has placed the facilities of the new nitriding furnace at the disposal of manufacturers who, at present, lack such equipment. This is enabling them to make tests with Nitralloy before installing their own equipment for nitriding, which is a relatively simple process. The size of the furnace permits the company to nitride parts up to 23 ft. long, including such large pieces as cross-head guides for locomotives.

Mystic Iron Works Objects to Proposed Iron Rates

WASHINGTON, Oct. 1.—The proposed level of rates on pig iron from the furnace of the Mystic Iron Works, Everett, Mass., contained in the recent report of Examiner C. E. Simmons of the Interstate Commerce Commission, is objected to in a statement filed with the commission by counsel for the Mystic furnace.

It is contended in the statement that the proposed scale is too high and that it fixes rates for 30 miles and under that are higher than the present rates. In course of other exceptions it is stated as self-evident that the average interstate haul in New England is appreciably less than the average interstate haul in any other pig iron producing district. It is declared that the New England local rate structure on pig iron should correspond with the local rate structure on the same commodity in the other parts of the official territory for like hauls.

German Lathe Makers Unite

HAMBURG, GERMANY, Sept. 16.—Leading builders of lathes in Germany have formed a corporation, which will schedule output for the various manufacturers of turret, engine and other lathes, in an effort to prevent duplication of production. It is planned to confine each subsidiary company to one class of tool in an effort to reduce production costs. Sales will be controlled by the corporation both in Germany and abroad.

The International Acetylene Association will hold its annual meeting at the Congress Hotel, Chicago, Nov. 13 to 15. A. Cressy Morrison, 30 East Forty-second Street, New York, is secretary.

This Issue in Brief

Six-day "emergency stock" guards against production tie-up in the event of a material shortage. If reserve supply must be drawn upon for current production needs, a shortage report is immediately sent to the production department. When fresh material is received, reserve supply is immediately replenished. —Page 891.

* * *

Heat-treating furnace has ten hearths and one heating chamber. The furnace is of the rotary type, with the hearth extending down the center. Work is carried through a revolving barrel and is brought to temperature by radiant heat.—Page 908.

* * *

Accidents can be cut 50 per cent when foremen's cooperation is fully enlisted. Analyses of accidents show that, even in the well-ordered and well-guarded shop, most accidents are due to carelessness on part of the workmen or laxity in general shop instructions and practices.—Page 896.

* * *

Welding of stainless steels can be done successfully if nickel-chromium alloys are used. The serious grain growth, which develops in the straight chromium-iron alloys, is absent.—Page 888.

* * *

Condemns wearing of gloves around machine tools. Added accident hazard more than offsets any advantage gained, says manufacturing executive.—Page 896.

* * *

Iron and steel imports highest in three years. August total was 83,969 tons, largest since September, 1926. Exports were 242,856 tons, lowest this year.—Page 909.

Forging of chrome-nickel alloys can be done without difficulty between 2200 deg. and 1700 deg. Fahr. Below this range the metal has a tendency to rupture, if not crack.—Page 890.

* * *

Successful business today demands "creative spending" rather than "pinching economy," says association head. "Instead of the hang-on-to-the-dollar type there is needed the spend-plenty-of-money - promptly - on - competent-analysis type."—Page 901.

* * *

Pure copper castings, sound in every way, made by adding a small percentage of beryllium. The "almost impossible" is made possible by using the rare metal as a deoxidizer.—Page 911.

* * *

Cuts machining and assembling time from three weeks to three days. Pump casing which formerly consisted of 28 separate parts, requiring 44 machining operations, is now cast in two halves, which are machined in one set-up.—Page 897.

* * *

Production superintendent gives typed instructions simultaneously to 18 foremen by means of electric typewriters. New system speeds operations, does away with need for messengers, and reduces probability of error.—Page 893.

* * *

New September pig iron production record established with average daily output of 115,553 tons, which was 4.6 per cent below August daily rate. On Oct. 1 there were 205 furnaces in blast, a net loss of 5 for the month.—Page 922.

Machining costs cut by mounting 86 cutters on 7-ft. boring bar, weighing more than a ton. Cutters are set by micrometer gages, and each can be removed and ground without disturbing the others.—Page 897.

* * *

Non-rusting metal of the future will be non-ferrous, metallurgist believes. It appears certain, he says, that it will be easier to solve the problem of corrosion in non-ferrous metal products than in steel, and that the non-ferrous metals will be made at lower costs.—Page 914.

* * *

Will embrittlement develop in chromium-nickel alloys under certain atmospheric conditions? Stainless steel specialist fears so, although it may be in less dangerous range and over a much longer time cycle than in the case of chromium-iron alloys.—Page 889.

* * *

Chromium is what makes chromium-nickel alloys corrosion-resistant, says metallurgist. The nickel additions, he believes, are valuable more particularly in regard to their bearing on physical properties.—Page 889.

* * *

Oscillating the ingot mold during solidification produces an ingot having an outer columnar shell about 1½ in. thick, with normal carbon. There is a very sharp transition to small random crystals.—Page 894.

* * *

Errors in hoist manipulation are reduced by using arrow heads as hand-pulls. The arrow head pointing up lifts the load and the one pointing down lowers it. —Page 895.

ESTABLISHED 1855

Commodity Price Prospects

THAT the general commodity price average has changed but little in the rising tide of prosperity of the last few years has given the economists no little concern, for the theory has been that rising prices and prosperity were interlocked. To ordinary business men the course has seemed more natural. A combination of competition and "sales resistance," or the determination of buyers not to pay advances, has held prices substantially stationary and increased profits where obtained have been through the medium of cost reduction.

Should there be just a mild reaction in trade activity—what then? There has been a theory that a long-range tendency of prices to decline after a great war has been offset of late by increasing activity, whereby in essence there was a price advancing tendency, prevented from working out into the actual figures by the other trend. Should both trends coincide in direction, the course of prices would presumably be different.

Despite the many new things, we should still be able to get some useful information from the past. In the light of fuller knowledge we should be able to interpret the past better now than was possible at the time. What is the theory that will explain satisfactorily the 50 per cent advance in prices from 1897 to 1913? The low point of all time fell in 1897 and the Bureau of Labor's general index number rose a trifle over 50 per cent to 1913. The ascent was almost uniform, there being merely short backsets in 1901, 1908-9 and 1911. It is true that times had been bad for several years prior to 1897 and were still bad, but there was a veritable "boom" in 1899 and there were periods of particularly intense activity in 1902 and in 1905-6-7; but after that, and into October of 1913 the price average continued to advance.

By observing the advances in individual groups of commodities from 1897 to 1913 one finds something that is of particular interest and value at the present time. With 50.6 per cent increase in the general commodity average in the 16 years, the group farm products advanced 95 per cent and foods and food products went up 56 per cent, a large increase in them being unavoidable when farm products advanced so much. The various other groups increased only between 32 and 49 per cent, except that lumber and building materials went up 68 per cent. The groups that advanced 32 to 49 per cent were cloth and clothing, fuel and lighting, metals and implements, drugs and chemicals, house furnishings and miscellaneous.

When the quantitative theory of money could not possibly explain these divergences, it is not worth while to consider in detail what influence it may have contributed to the general average. The notable thing is the large advance in farm products and it is obvious that this had something to do with the increases in the other groups. If farm products had not advanced as they did the other commodities would not have gone so high. Incidentally it has been a particularly lucky thing for the farmers that 1913 chanced to be selected for the comparisons of recent years.

The United States Government is now engaged in a serious effort to improve the position of the farmer, not so much by reducing his production costs as by raising his selling prices. There is no promise in this of lower costs for manufacturers and other producers and besides there is the continued downward trend in hours of labor.

The Ways of Investment Trusts

IF a corporate stock now selling at $100 per share for the reason that it is yielding an annual dividend of $5 should in the course of two or three years be put upon a $10 basis its quotational value would become $200 per share, assuming of course that economic conditions underwent no change affecting the satisfaction of investors.

In all probability if a corporation had such a success the abler investors would have sensed increasing earnings and upon the strength of their anticipatory buying the price for the stock would have advanced to $200 long before a $10 dividend rate were declared.

In the course of the advance there doubtless would be many fluctuations, undulating above and below an ascending line, and it is conceivable that a speculating investor starting with 100 shares, repeatedly selling out and buying back, might find himself at a final liquidation at $200 with a profit of $20,000 instead of $10,000.

In the converse instance of declining value all of the foregoing would be written in the opposite.

Of course, what we have remarked hereinbefore is thoroughly trite. Even so it helps in the understanding of investment trusts—their philosophy, operation, etc.—which have become a highly important thing in our economic affairs. It has been estimated that their aggregate capitalization now runs to something like 2.5 to 3 billion dollars, which probably is only a guess. However, the amount is undoubtedly very large.

The subject is too big and too ramifying for comprehensive discussion in a single editorial. Nevertheless there are certain principles that stand out clearly and may be broadly stated. The investment trusts express to the public the idea that they can handle money better than can the ordinary, even the average,

individual; and so much better that the yield to their clients is improved, although a large administration expense and a luscious commission have previously been deducted. It is clear from the exposition above, however, that the investment trust does not create any wealth, credit, or anything else. Using the term money in the vernacular, whatever the investment trust makes some one else does not make. There is simply a change of destination. Metaphorically the investment trusts may be described as the lions of Wall Street with whom the lambs lie down and become fat while the wolves grow lean, even to famishing. Of course, there will be instances of wolves disguising themselves as lions, and their particular lambs will not become fat.

Some of the superior investment trusts maintain extensive staffs of engineers and economists and base their commitments, or fill their portfolios (as financial writers like to say), upon the most intelligent and meticulous study. Others operate only on their commercial sense, or instinct. Still others govern themselves upon no other principle than the control of heaps of money. Analogously the investment trusts run the gamut from the exploration company to the speculative pool. Investment trusts of the latter type, that merely play the market, may be expected to explode every now and then, as happened to a little one lately. The sounder ones, which no doubt constitute the great majority, buying for dividends and increment, borrowing no money, are probably safe so long as our national economy is safe, although perhaps their income and profit may not always be so large as at present. After all, their position is much the same as that of the investment department of a university, or of an insurance company, or of a powerful individual, although there are certain important points of difference.

Your Convention Money's Worth

CONVENTIONS are a problem to many an employer. Do his representatives get a return in new knowledge and experience in any fair proportion to the money spent? Frequently not. Many pay too little attention to technical sessions and even less to the new features of the exhibition, if there is one. "Too many parties" is often the complaint. And yet the employer feels that he must be well represented.

A new departure was made recently and with apparent success by a large agricultural implement organization operating several plants. The chief metallurgist brought with him a group of his assistants. Each morning at breakfast the day's program (at the National Metal Congress in Cleveland) was gone over. Then selected individuals were given assignments to certain sessions or to visit designated departments of the exposition. At night, usually at dinner, the group came together and the members reported their impressions and discussed the papers. Often new ideas brought out in talks with fellow steel treaters were the topic.

While the subject of convention methods and results is up, it may be added that very recently the attitude of various industrial executives toward certain forms of entertainment has undergone a change. President Hoover's efforts for a more general observance of prohibition laws are the moving cause. We have in mind companies whose record for convention wetness has been well known, who are now taking their stand with the President and putting a ban on the serving of liquor by their sales departments from hotel room sideboards.

The Next Advance in Welding

AMONG the dozens of unexplained facts about welding is the following, which is fairly well known to the workmen: That if a piece of welding wire is merely rubbed bright with fine emery cloth, it is impossible to do satisfactory work with it. That is a very curious fact. But the present purpose is not so much to speculate upon the influence of a microscopic film of mill scale as to emphasize that *some* coating is necessary to stabilize the arc in metallic electrode welding. This is a first principle recognized by welding wire makers. A popular plan is to give the wire a copper coating; but each manufacturer has his own ideas about the most efficient way to give the so-called "bare electrode" its correct surface.

A few have reasoned that if some coating is absolutely essential, a little more would improve the welding characteristics, and consequently they have exploited the "covered electrode." Many varieties are now available, and have been developed independently by experimenters in America, England and on the Continent. Eventually we shall doubtless organize these isolated developments into systematic knowledge of what constituents are essential and what are merely psychological.

At present it appears that covered electrodes have these pronounced advantages: The arc wanders less than when using bare electrodes, thus permitting a higher current density and a greater rate of metal deposition. Further, the coating melts into a fusible slag which protects the weld metal from the atmosphere and thus improves its soundness and ductility. Counterbalancing these are the drawbacks that the covered electrodes are expensive and often fragile. Furthermore, the slag must be cleaned off the weld (a particular job when more than one layer must be deposited in a thick joint) and this extra operation is costly.

From the great preponderance of "bare" electrodes used in metallic arc welding, both manual and automatic, it may be concluded that the disadvantages of such covered electrodes as have been exploited more than offset the advantages. It is our belief, however, that this eminently practical conclusion is due to the fact that the covered electrode idea has not yet been developed to its logical limit—at least by companies that are in the business of making and selling welding equipment. The same cannot be said of certain firms who are much interested in automatic welding as a production process.

A specification for a really fine covered electrode would include the following important points: The covering material should be tough and adherent enough to stand shop handling; non-hygroscopic and stable in temperate climate. The covering material and the electrode should vaporize at the same rate, and the gas from the former should effectually prevent reaction between the white hot iron atoms and oxygen or nitrogen in the surrounding air. The vapor from the covering material should be a non-conductor

of electricity, or at least of such a nature as to concentrate the stream of electrons within a small area, thus stabilizing the arc, and increasing the rate of deposition of a superheated fluid steel. The slag from the melted covering should separate cleanly from the weld metal—no included particles. The slag should be a poor conductor of heat so that the weld metal may slowly cool, and have an annealed, fine-grained structure. The slag should solidify into a brittle mass, easily and cleanly removed from the underlying bright metal. For automatic welding the coating should be applied continuously just before using.

An ideal state; an impossible set of specifications? By no means. That the problem is not impossible is proved by the fact that it certainly has been solved already by at least two organizations (and perhaps more) working entirely independently. That the welding rate under such conditions is extraordinarily high is an open secret. That the quality of the welded joint is beyond reproach has been demonstrated by exhaustive tests.

When is the welding industry generally going to take these facts to heart and act accordingly?

Wide Field for Conveyor Systems

THAT mechanical conveyors can be successfully used only by large plants and in mass production is an idea still prevalent, but disproved by the experience of not a few companies. Some specific cases come to mind.

A Middle Western gray iron foundry making only three tons of castings a day has been equipped with conveyors after the fashion of the large automobile foundries and with a saving in men and space. An Ohio pump manufacturer of modest size has organized its factory on a progressive assembly plan with conveyors serving as the main stem in the production scheme. A New England machine shop has recently become more profitable through the use of material handling equipment.

Where conveyors cannot be employed in subassembly operations because of the nature of the work, they often can be made to solve the main assembly problem. Where they do not fit economically into the general manufacturing plan, frequently they can be used to lower the expense of certain operations. The point is that today no manufacturer, no matter how large or small, can overlook the possibilities of machine conveyors without risk of suddenly finding that a rival's vigilance in cutting production costs has allowed the latter to sell his product more cheaply.

Another popular belief is that the flow of materials through a plant must constantly be at a high rate in order to make mechanical conveyors profitable. That this cannot be applied as a blanket rule appears from the experience of a manufacturer of radio sets who installed a web of conveyors reaching into practically every department. The company's production for a time fell some 65 per cent below what the conveyors had been designed to handle, and yet the plant engineers estimated that, even though operations went on with no increase upon that rate, the conveying system would fully pay for itself within nine months.

Changing Production of Fuels

IN six years, 1923 to 1929, production of coal, petroleum and natural gas has increased about 5 per cent, as is shown when the three are added together on a heat-unit basis. The proportions, however, are greatly altered. Bituminous coal has lost about 10 per cent and anthracite nearly one-fourth, while oil has increased nearly a third and natural gas has increased by about two-thirds. Total B.t.u. represented were a trifle under 23 quadrillions in 1923 and will probably be measurably under 24 quadrillions this year.

The change in distribution is the interesting thing, represented by the following approximate figures:

Proportion of Heat Units

	1923	1929
Bituminous coal	65.0	58.6
Anthracite	11.1	8.5
Petroleum	19.2	25.1
Natural gas	4.7	7.8
Total	100.0	100.0

The course of natural gas production is of particular interest, and especially to the steel trade, seeing what a large demand there has been lately for line pipe for natural gas movement. The first statistics of natural gas production were for 1915, showing 628,578,842 thousands of cubic feet. Statistics for last year have just been issued, at 1,568,139,000 thousand cubic feet. Natural gas became a great thing for the Pittsburgh district in the eighties of the last century and a life saver for the infant tin plate industry in the next decade. The tin plate mills grouped in Indiana were called "the gas belt mills" and much glass manufacture was attracted to the same region.

Some of the older gas regions played out entirely, while others lost only slightly, but there have been big discoveries out west. The statistics show substantially uniform production for 1915 to 1922 inclusive; then large annual gains appeared, last year's production being double the average for the eight years through 1922. In each of the last three years there has been in the neighborhood of 10 per cent increase, and with the large number of gas lines laid recently, it is safe to estimate this year at 10 per cent over last year, or at somewhat more than 1,700,000,000 thousand cubic feet.

Petroleum will show a substantial gain over last year, probably about 11 per cent, to one billion barrels. There was a very large gain but restrictive measures have lately come to apply. The 1923 production was 732,407,000 barrels.

Comparison between 1923 and 1929 is not altogether fair to coal, for the reason that production in 1923 was stimulated after a strike year. Bituminous production this year, while below that of 1923, will be above that of any intermediate year except 1926. Anthracite production has been slipping slowly, in part because of strikes and consequent resort to fuel oil and gas. It had shown a distinctly standard rate at 90,000,000 tons until, in two war years, there was an excess of about 10 per cent. For several years after the war the old rate was in evidence, but now 75,000,000 tons is approximately the measure.

Continuous Sheet Process Licensed to Republic

The American Rolling Mill Co. has licensed its entire patent structure, covering processes for the rolling of wide thin sheets, to the Republic Iron & Steel Co., according to an announcement by George M. Verity, president of the American Rolling Mill Co.

This makes the fifth steel company to be licensed by the American Rolling Mill Co. Those granted licenses heretofore are the Weirton Steel Co., the Wheeling Steel Corporation, the United States Steel Corporation and the Gulf States Steel Co.

Rockwell Company Opens Its New Plant

The new home of the Stanley P. Rockwell Co., Hartford, Conn., at 296 Homestead Avenue, is announced as completed. It is an attractive building, equipped for the manufacture and servicing of the Rockwell dilatometer and other products of the company. A cordial invitation to inspect the new plant is extended to those interested.

Ornamental Iron and Bronze Makers to Meet

The twenty-second annual convention of the National Association of Ornamental Iron and Bronze Manufacturers will be held at Hotel Jefferson, St. Louis, Oct. 8 to 11. The program will include the following speakers: Harry F. Huff, manager, Kenosha, Wis., branch of the American Brass Co., on "History and Progress of Anaconda Extruded Metals"; Dr. Hugh P. Baker, manager, Trades' Association Department of the United States Chamber of Commerce, on "Trade Associations and American Business"; Harry A. Einstein, representative, Credit Clearing House Adjustment Corporation, New York, on "The Value of the Trade Association Credit and Collection Service," and C. C. Johnston, credit manager, St. Louis branch of Joseph T. Ryerson & Sons, Inc., on "Cost Accounting."

Crucible Buys Interest in Shenango Mines

The Shenango Furnace Co., Pittsburgh, announces the sale to the Crucible Steel Co. of America of a large interest in its extensive iron ore holdings located on the Mesabi range, St. Louis County, Minnesota, which will insure a supply of ore for Crucible Steel for about 30 years.

An operating company will be formed, the ownership of which will be held by the Crucible and Shenango interests. The present organization of the Shenango Furnace Co. will continue to operate the properties, as it has been active in the iron mining industry in the Lake Superior region for many years under the guidance of the W. P. Snyder interests. By this new deal these two old Pittsburgh concerns will be closely affiliated in future.

The ore produced from the different properties will be mostly consumed by the Shenango and Midland furnaces. The two largest properties figuring in the sale are the Shenango mine, which has been one of the big producers for many years, and the Webb mine, which has only recently been producing on a large scale. Both properties are operated by open pit mining.

By Crucible's purchase of a substantial part of these ore reserves it places itself in an independent position on raw materials, as the company already has ample coal and limestone properties to care for its requirements for many years.

The Week in Business

Drift of Current Financial and Economic Opinion

OPTIMISM seems to have become its own nemesis, so far as the stock market is concerned. The manifestly bright prospects for industry, particularly in this country, caused a world-wide rush to share in its future prosperity. But the speculation that ensued reached such proportions as to consume funds needed to insure the realization of business expectations.

The increase in discount rate of the Bank of England from 5½ to 6½ per cent in the past week is the latest of a series of central bank rate changes traceable to the demand for call money in the United States. Since Jan. 1, according to the New York *Herald-Tribune*, there have been 21 such rate changes, all but two being advances.

The English rate is now the highest since 1921 and, in the view of D. W. Ellsworth of the *Annalist*, will entail readjustments in international financial relations that are likely to react unfavorably on business in this country. A temporary slackening of activity, however, is the very thing needed to keep business on a sound and enduring basis, in the opinion of the National City Bank of New York, since it would have a sobering influence on speculative sentiment.

Commercial and Financial Chronicle takes a less sanguine view. In commenting on the further rise of brokers' loans to a new peak it says, "The full measure of the ill consequences in this last particular still remains for the future to determine."

This journal traces the origin of the stock market boom to the easy money policy inaugurated by the Federal Reserve authorities in the summer of 1927, when rediscount rates were reduced to the very low figure of 3½ per cent and the country was flooded with Reserve credit by the hundreds of millions through the purchase of Government securities. The purpose of the move was to divert bullion to Europe to help certain countries, notably Great Britain and France, to return to the gold standard. But, the *Chronicle* adds, the absorption of bank credit in stock speculation forced Europe "to yield up again the gold which Federal Reserve policy had so graciously placed at its disposal."

The general level of commodity prices, the Harvard Economic Society says, may weaken further over the remainder of the year. Continued firm money is in prospect; and in the fourth quarter the depressing influence of this condition upon foreign exchanges—and hence upon European commodity prices—is aggravated by the large seasonal expansion in export trade.

Certain it is that higher money rates in Great Britain will hamper the financing of its grain purchases. This factor must be taken into account in appraising the American agricultural situation. Our crop yields, according to an estimate by the Alexander Hamilton Institute, will show an average decrease of 9 per cent from those of 1928. The net result, in the belief of the Corn Belt Farm Dailies, is likely to be as many farm dollars as during the past year, but rather unevenly distributed. "It will be a very prosperous year for some farmers and a rather poor year for others."

The country as a whole, in the opinion of the Hamilton Institute, will be adversely affected. "Farm labor will not be so well employed, railroads will suffer from a reduction in freight, the nation's food bill will be increased and the people will have less money to spend for clothes, furniture, automobiles and other items which contribute to prosperity."

A Record September in Iron Output

Daily Rate Less Than August by 4.6 Per Cent or 5598 Tons—Nine Months' Total 1,553,500 Tons Over Next Largest—Net Loss of Five Furnaces

WITH all furnaces reporting and with only a few which could not give actual totals, data collected by wire on Oct. 1 show that September pig iron output established a new record for that month. A new total for the first nine months of any year was also registered.

September production was at the rate of 115,553 gross tons per day, a decline of 5598 tons or 4.6 per cent from the August rate of 121,151 tons per day. The nearest approach to this for September was 113,942 tons per day in 1918. The September total was 3,466,611 tons or 115,553 tons per day for the 30 days, as compared with 3,755,680 tons or 121,151 tons per day for the 31 days in August. The September daily rate is the smallest since February this year when it was 114,507 tons. In September a year ago the daily rate was 102,077 tons.

Operating Rate on Oct. 1

There were 205 furnaces operating on Oct. 1 having an estimated operating rate of 115,190 tons per day. This compares with an operating rate of 119,130 tons per day for the 210 furnaces active on Sept. 1. Nine furnaces were shut down and four were

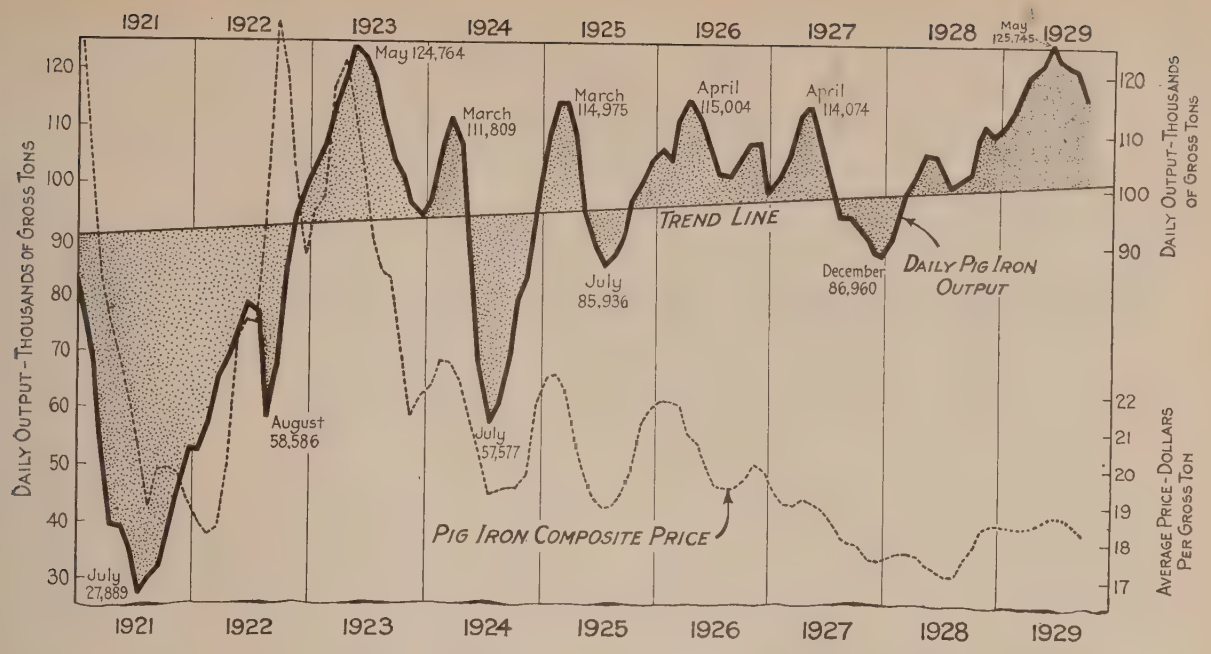
*These totals do not include charcoal pig iron. The 1928 production of this iron was 142,960 gross tons.



Production of Pig Iron So Far This Year Has Averaged Slightly Over 120,000 Tons a Day

Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 423,000 tons

blown in during September—a net loss of five furnaces. This compares with a net loss of six furnaces in August.

No merchant furnaces were blown in or out last month. The Steel Corporation sustained the largest loss—one blown in and six shut down. Independent steel companies blew in three and shut down three. The net loss of five for the month was in steel-making furnaces.

Nine Months Make a New Record

For the nine months ended with September the total output was 32,648,371 tons. The nearest approach to this for the same period was 31,094,873 tons in 1923, an increase of 1,553,498 tons or 5 per cent.

Large Loss in Steel-Making Iron

There was a loss of 4986 tons per day, or 5 per cent, in steel-making iron or 93,914 tons per day for September compared with 98,900 tons per day for August. The merchant loss was only 612 tons per day.

September Output of Ferromanganese

Ferromanganese output in September was 27,310 tons which compares with 28,461 tons in August. It was the fifth largest this year. Two companies were making spiegeleisen last month.

Furnaces Blown In and Out

Among the furnaces blown in during September were one Ashland furnace of the American Rolling Mill Co. in Kentucky, No. 3 Ohio furnace of the Carnegie Steel Co. and one Campbell furnace of the Youngstown Sheet & Tube Co. in the Mahoning Valley, and one furnace of the Colorado Fuel & Iron Co. in Colorado.

Among the furnaces blown out or banked during September were No. 1 Isabella furnace of the Carnegie Steel Co. in the Pittsburgh district, C furnace at the Maryland plant of the Bethlehem Steel Corporation, No. 6 Ohio furnace of the Carnegie Steel Co. and Grace furnace of the Youngstown Sheet & Tube Co. in the Mahoning Valley, one furnace of the National Tube Co. for complete relining in Northern Ohio, two South Chicago furnaces of the Illinois Steel Co. and one Gary furnace in the Chicago district, and No. 3 furnace of the Sloss Sheffield Steel & Iron Co. in Alabama.

*Includes output of merchant furnaces.

The Pittsburgh Steel Co. and subsidiaries, for the year ended June 30, 1929, shows net income for that period of $4,535,437. After deductions for dividends on common and preferred stock, total surplus for the year was $3,041,687. During the year the company shipped 532,565 net tons of steel products. The average number of employees at steel works was 6153, and total salaries and wages paid amounted to $12,899,142.

Minnesota Steel Co., Duluth, Minn., has filed plans for a one-story addition to its merchant mill, to be equipped primarily for production of steel fencing, reported to cost about $100,000.

Iron and Steel Markets

Further Drop in Automobile Output

Two Leading Makers of Low-Priced Cars to Suspend Operations —Railroad Demand Still Expanding—Sheet Prices Weak—Scrap Lower

AUTOMOTIVE demand for finished steel has undergone a further slump, in contrast with the expanding requirements of the railroads and the sustained needs of the structural steel industry and other avenues of consumption.

The two leading makers of low-priced automobiles, both of which are bringing out new models, are scheduled to shut down their plants this month, one for two to four weeks and the other for 30 days. Although several motor car builders are preparing to get under production on new models about Nov. 1, the industry's operations during the rest of the year are unlikely to show much recovery.

Meanwhile railroad buying of both rails and equipment is assuming larger proportions. The Santa Fe has purchased 87,200 tons of rails, and the Monon, 4500 tons, while the formal distribution of orders by the Chesapeake & Ohio, Pere Marquette and Hocking Valley called for a total of 79,256 tons. The New York Central is in the market for 200,000 tons, to which 14,000 tons may be added for new lines. The Pennsylvania's inquiry for 310,000 tons is the largest it ever put out.

Orders for track accessories, the trend of which is upward, will call for at least 30 per cent of the tonnage of the rails bought, compared with 20 per cent a decade ago.

Rolling stock purchases include 3700 freight cars, nearly 1000 car bodies and 73 locomotives. Counting 7000 cars to be bought by the Baltimore & Ohio, approximately 6000 each by the Chesapeake & Ohio and the Santa Fe, 4000 by the Southern, 2700 by the Burlington and 1900 by the North Western, freight equipment orders definitely in sight total 30,000 units.

Mills serving the railroads and the construction industry, in contrast with those primarily dependent on the motor car manufacturers, have undergone the smallest reduction in operations and may show a gain this month. From the standpoint of weather conditions, October is an ideal production period and in past years has usually been the peak month of the last half of the year.

To fill up gaps in rolling schedules railroads and others are cooperating with producers by speeding up their specifications. A Chicago mill is already rolling 12,000 tons of plates for 1000 St. Paul cars, and the A. O. Smith Corporation, Milwaukee, which has booked two California line pipe orders, is releasing orders against the 69,000 tons of plates required.

Demands from the farm equipment industry, partly because of foreign orders for tractors, have improved. Fabricated structural steel lettings are large, totaling 50,000 tons, against 35,000 tons last week. Additions to pending work, amounting to 54,000 tons, include 17,000 tons for New York subway sections and 12,000 tons for a Chicago office building.

While ingot output for the steel industry at large has declined further and the lull in automobile manufacture will tend to offset heavier demands from other sources, it is possibly significant that the Steel Corporation rate, 89 per cent, shows a gain of a few points. Production of independents, on the other hand, probably does not average more than 80 per cent, with some of them running as low as 75 per cent of capacity.

Pig iron production in September totaled 3,466,611 tons, or 115,553 tons a day. While this was the largest output for any ninth month, it showed a decline from August, in terms of daily rate, of 4.6 per cent. Four furnaces were blown in and nine blown out, all of them steel company stacks, making a net loss of five stacks for the month. Output for the nine months, at 32,648,371 tons, established a new record, surpassing the previous high total, for the corresponding period in 1923, by 5 per cent.

Finished steel prices have developed further weakness, notably in sheets and wide strip, on which concessions are more common. Wire nails, despite the recent reduction in price, are very irregular, particularly in some parts of the Chicago district.

Scrap markets continue to weaken, and heavy melting steel has undergone a further decline of 25c. at Pittsburgh and 50c. at Chicago.

Pig iron demand has subsided, following a fair volume of contracting for fourth quarter. Melt is well sustained except in sections where automobile business is an important factor. Southern competition in Northern markets has diminished and surplus steel company iron has not yet disturbed prices. A purchase of 5000 tons of basic by a steel foundry failed to break the Valley market of $18.50, furnace.

Exports of iron and steel in August, at 242,856 tons, were the smallest of any month this year. Imports, at 83,869 tons, were the largest since September, 1926.

The International Steel Cartel has been renewed provisionally until the end of March, with production quotas unchanged for the fourth quarter. The International Rail Makers' Association has reaffirmed its prices.

Both of THE IRON AGE composite prices are unchanged, finished steel at 2.384c. a lb. and pig iron at $18.29 a gross ton. The former is 44c. a net ton higher than a year ago, the latter 45c. a gross ton higher.

Pittsburgh

Steel Demand Trend Still Indefinite, While Output Tapers —Railroad Needs Feature Market

PITTSBURGH, Oct. 1.—Pittsburgh district steel makers enter the last quarter of the year with the trend of demand rather undetermined and production still tending downward. Specifications during the last two weeks of September were at a considerably better rate on most products than they were during the first two weeks of the month, but they were still far from sufficient to maintain the operating rate which had prevailed during the summer months. At present most of the steel finishing departments are operating on a hand-to-mouth basis, although an exception might be made in the case of tin plate. The leading maker of this product has begun to work on anticipated tonnage. A few makers of sheets also have tonnage on their books which will carry them well into October, but such backlogs are rapidly being worked off as automobile demand for sheets tapers.

Railroad demand for steel continues to feature the market. Pittsburgh mills will undoubtedly share in the rail purchases of the Pennsylvania and the New York Central, both of which are to be slightly heavier than usual. Car buying also promises to continue. The Baltimore & Ohio has authorized the purchase of 7000 freight cars, from which local mills will likely benefit. Sheet makers in this district have received orders for galvanized material for cars recently.

Price concessions continue to appear on many products, although mills have not recognized this condition in their regular price schedules except on wire products. The weakness in nails and wire for the jobbing trade has not spread to manufacturers' wire, on which makers are maintaining a firm price policy. Concessions of $2 a ton on wire rods are being met in this district.

Recent price shading generally has not been among the regular customers of the larger mills, but has appeared when other steel companies, not so well supplied with business, have sought orders from users whom they do not ordinarily serve.

Pig iron shipments during September were ahead of those in August, and orders placed during the month gave some producers comfortable backlogs. However, many large users have not covered their needs for the last quarter and moderate buying is expected to be well distributed over the closing months of the year.

The scrap market shows further softness as a result of another week of practically no mill buying, but prices will be clarified somewhat by the closing of the railroad lists in the next few days.

Pig Iron.—Shipments during September from Valley and local merchant furnaces were somewhat larger than in the previous month, and aggregate sales of local dealers were considerably heavier. This was expected in view of fourth quarter contracting. It is believed, however, that consumers in this vicinity have by no means fully covered their needs for the last three months of the year, and that buying will be fairly well distributed throughout the quarter. Merchant furnaces are making no large additions to their stocks, and thus far

steel companies have not aggressively pushed the sale of iron in this territory. Two large steel companies are normally the sellers of pig iron, but no others are reported to have come into the market. American Steel Foundries has bought basic iron for its Alliance, Ohio, plant at the full $18.50, Valley, price. Price concessions are not reported in the market, although buyers are inclined to believe that the situation is not so strong as it was a short time ago. Foundry and basic iron are still quoted at $18.50, Valley, and malleable and Bessemer at $19, while the local furnace has quoted prices 50c. a ton higher.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—As was the case at the beginning of the third quarter, buyers of semi-finished steel are hesitant in closing against their requirements for the last three months of the year. In some cases there is still some question as to the price on billets and slabs, while in others non-integrated companies have considerable steel coming to them on old contracts, and are in no immediate need of further supplies. Small users of billets, slabs and sheet bars have closed their fourth quarter contracts at $35, Pittsburgh, and forging billets are bringing $40. The weak price situation in wire and nails has been reflected in wire rods, and contracts have been taken at $40, Pittsburgh and Cleveland. The price of skelp is unchanged at 1.85c. to 1.90c., Pittsburgh or Youngstown.

Bars, Shapes and Plates.—Business is still rather spotty, although September specifications of some companies do not show so large a decrease as was indicated by the tonnage released in the first two weeks of the month. Most mills have considerable plate tonnage on their books yet to be rolled, and the buying movement in freight cars, which is now getting under way, will contribute to backlogs. It will be several weeks, however, before the steel for cars now being placed will reach the mills in the form of specifications. Barge buying in prospect also promises to contribute to the plate tonnage for the remainder of the year, and there is a real shortage of barges on the Ohio River and its tributaries. The Standard Unit Navigation Co. is expected to issue specifications this week on the 50 steel barges which it announced last week as probable purchases. Other barge work is also in prospect, although not many general inquiries have yet reached the trade. Structural business also looks more favorable. The Board of Commissioners of Allegheny County is expected to issue plans this month for a bridge across the Ohio River at McKees Rocks, Pa., which will require 15,000 tons. Another large bridge at Turtle Creek, Pa., is in prospect, and will require a large tonnage. Awards this week include a bridge at Point Marion, Pa., calling for 850 tons. Reinforcing bar business is still fairly active, and it is expected to keep up for several weeks before winter weather interferes with construction. Prices on bars and shapes are weak, and although some mills are still quoting 1.95c. on fourth quarter business, considerable tonnage is going at 1.90c. Concessions from 1.95c. on plates are not common in this territory.

Bolts, Nuts and Rivets.—Makers have no difficulty in signing up fourth quarter contracts at 70 per cent off list for bolts and nuts, and 70 and 10 on small rivets. The price of large rivets is unchanged at $3.10 a 100 lb., Pittsburgh or Cleveland. Makers have felt the falling off in automobile tonnage during the last month or six weeks, but operations for the industry as a whole average 65 to 70 per cent of theoretical capacity. The railroad car builders are expected to require large tonnages in the closing months of the year.

Rails and Track Accessories.—The Pennsylvania Railroad has issued its 1930 rail requirements, the total of 310,000 tons exceeding that of last year by 38,000 tons. The New York Central inquiry for 200,000 tons is also larger than last year's. Pittsburgh mills did not share heavily in the Chesapeake & Ohio tonnage, which was placed last week. The Baltimore & Ohio, which is soon expected to come into the market for 7000 freight cars, has not yet announced its next year's rail requirements. September shipments of track accessories were fairly good for this time of the year. This is the off season for such business, and improvements will not begin for another two months.

Sheets.—Attention in this market is centered largely on prices, as buyers are seeking lower quotations on fourth quarter tonnage. Mills, particularly the larger interests, are taking a firm stand on prices. However, some shading is occurring on all the common finishes of sheets and it remains to be seen whether concessions will become common enough to justify lower quotations. A few makers are still quoting 3.60c., Pittsburgh, on galvanized sheets, although 3.50c. is becoming a more common price. Black sheets are unchanged at 2.85c., Pittsburgh, and shading has not become general except to large Michigan buyers who ordinarily enjoy a preferential price. On light plates and blue annealed sheets, the common quotations are 2.20c. and 2.35c., Pittsburgh, respectively, although $2 a ton concessions are not infrequent. There is also occasional shading of the 4.10c. price on automobile body sheets. Fourth quarter contracting on the part of large users is still being delayed, but many consumers will have shipments coming to them during the greater part of October and a few mills still have sufficient backlogs to last for three or four weeks. The leading interest is still operating at close to 90 per cent of capacity and the independents

The Iron Age Composite Prices

Finished Steel

Oct. 1, 1929, 2.384c. a Lb.

One week ago	2.384c.
One month ago	2.398c.
One year ago	2.362c.
10-year pre-war average	1.689c.

Based on steel bars, beams, tank plates, wire, rails, black pipe and black sheets. These products make 87 per cent of the United States output of finished steel.

Wider than 6 in., P'gh	1.90c.
6 in. and narrower, Chicago	2.20c.
Wider than 6 in., Chicago	2.10c.
Cooperage stock, P'gh	2.20c.
Cooperage stock, Chicago	2.30c.

Cold-Finished Steel

	Base per Lb.
Bars, f.o.b. Pittsburgh mill	2.30c.
Bars, f.o.b. Chicago	2.30c.
Bars, Cleveland	2.30c.
Bars, Buffalo	2.30c.
Shafting, ground, f.o.b. mill	*2.65c. to 3.60c.
Strips, P'gh	2.75c. to 2.85c.
Strips, Cleveland	2.75c. to 2.85c.
Strips, del'd Chicago	3.05c. to 3.15c.
Strips, Worcester	2.90c. to 3.00c.
Fender stock, No. 20 gage, Pittsburgh or Cleveland	4.25c.

*According to size.

Wire Products

(Carload lots, f.o.b. Pittsburgh and Cleveland, to jobbers and retailers.)

	Base per Keg
Wire nails	$2.45 to $2.55
Galvanized nails	4.45 to 4.55
Galvanized staples	3.15 to 3.25
Polished staples	2.90c. to 3.00c.
Cement coated nails	$2.45 to $2.55
	Base per 100 Lb.
Bright plain wire, No. 6 to No. 9 gage	$2.40 to $2.50
Annealed fence wire	2.55 to 2.65
Spring wire	3.50 to 3.60
Galv'd wire, No. 9	3.00 to 3.10
Barbed wire, galv'd	3.10 to 3.20
Barbed wire, painted	2.85 to 2.95
Woven wire fence (per net ton to retailers)	65.00

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass. (wire), mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Cut Nails

	Per 100 Lb.
Carloads, Wheeling, Reading or Northumberland, Pa.	$2.70
Less carloads, Wheeling or Reading	2.80

Light Plates

No. 10, blue annealed, f.o.b. P'gh	2.10c. to 2.20c.
No. 10, blue annealed, f.o.b. Chicago dist.	2.30c.
No. 10, blue annealed, del'd Phila.	2.42c. to 2.52c.
No. 10, blue annealed, B'ham	2.35c.

Sheets

Blue Annealed

	Base per Lb.
No. 13, f.o.b. P'gh	2.25c. to 2.35c.
No. 13, f.o.b. Chicago dist.	2.45c.
No. 13, del'd Philadelphia	2.67c.
No. 13, blue annealed, B'ham	2.50c.

Box Annealed, One Pass Cold Rolled

No. 24, f.o.b. Pittsburgh	2.75c. to 2.85c.
No. 24, f.o.b. Chicago dist. mill	2.95c. to 3.00c.
No. 24, del'd Philadelphia	3.07c. to 3.17c.
No. 24, f.o.b. Birmingham	3.00c. to 3.10c.

Metal Furniture Sheets

No. 24, f.o.b. P'gh	4.10c. to 4.20c.

Galvanized

No. 24, f.o.b. Pittsburgh	3.50c. to 3.60c.
No. 24, f.o.b. Chicago dist. mill	3.60c. to 3.70c.
No. 24, del'd Cleveland	3.59c. to 3.69c.
No. 24, del'd Philadelphia	3.82c. to 3.92c.
No. 24, f.o.b. Birmingham	3.70c.

Tin Mill Black Plate

No. 28, f.o.b. Pittsburgh	2.90c. to 3.00c.
No. 28, f.o.b. Chicago dist. mill	3.00c. to 3.10c.

Automobile Body Sheets

No. 20, f.o.b. Pittsburgh	4.00c. to 4.10c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill	4.00c. to 4.10c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	$0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅜ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	48½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	38	1½ in.	1
2½ in.—2¾ in.	46	1¾ in.	8
3 in.	52	2 in.—2¼ in.	13
3¼ in.—3¾ in.	54	2½ in.—2¾ in.	16
4 in.	57	3 in.	17
4½ in. to 6 in.	46	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	61	3 in.	46
1¼ to 1½ in.	53	3¼ to 3½ in.	48
1¾ in.	37	4 in.	51
2 to 2¼ in.	32	4½, 5 and 6 in.	40
2½ to 2¾ in.	40		

Hot Rolled

2 and 2¼ in.	38	3¼ to 3½ in.	54
2½ and 2¾ in.	46	4 in.	57
3 in.	52	4½, 5 and 6 in.	46

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take the mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

are probably not more than five points under this figure.

Wire Products.—Business in wire and wire nails is very slow, and is not helped by a very unsatisfactory price situation so far as jobbbers' business is concerned. Wire nails are still quotable at $2.45 to $2.55 per keg, Pittsburgh, although the price at Chicago is weaker by at least $1 a ton. Ordinarily the market at Chicago is $1 higher than Pittsburgh. Jobbers' wire products have reflected the weakness in nail prices, and the 2.40c. Pittsburgh price is being shaded on some business. On manufacturers' wire, this is the minimum of Pittsburgh district mills.

Tubular Goods.—Pipe mills in this and nearby districts continue fairly busy, with the operating rate of the industry as a whole at 70 to 75 per cent of theoretical capacity. Seamless mills are the most active, while the butt weld units are not so well engaged. Business in lap weld tubing is of a hand-to-mouth character as mills do not have heavy backlogs, but orders placed from day to day seem to be sufficient to justify a good operating rate. • Mechanical tubing is still rather dull on account of the reduced operations of the automobile industry, but signs of improvement are reported from some sources. There is a good movement of boiler tubes. Prices on lapwelded steel and standard commercial seamless boiler tubes have been advanced $4 a ton by leading makers, the advance effecting a two-point reduction of all base discounts f.o.b. Pittsburgh. No change has been made in the price of charcoal iron boiler tubes.

Tin Plate.—Mill operations are holding up remarkably well, with the leading producer running at 85 to 90 per cent of capacity and the independents ranging down to 70 or 75 per cent. The latter have not yet begun working on anticipated tonnage for next year, while such business is contributing to the well sustained operating rate of the largest maker. September shipments were high for that month, and the end of October will likely see a gradual improvement. However, little 1930 business is placed until the next year's price is announced, usually in the first half of November.

Strip Steel.—Business is spotty. Incoming tonnage is just about sufficient for a 70 to 75 per cent operation in the industry as a whole. In some cases, the cold mills have a better engagement while the reverse is true with other makers. Slightly heavier releases from some of the automobile companies are giving the market a somewhat more optimistic turn, although few makers expect a very large increase from this source in the fall months. Occasional price shading is reported, but the market is not quotably lower on either hot-rolled or cold-rolled material. In a few cases makers of welded tubing are reported to have renewed old contracts for cold-rolled strip, carrying a price under 2.75c., Pittsburgh or Cleveland, but this figure still represents the market. Instances of shading the hot-rolled strip prices of 1.90c. and 2c., Pittsburgh, are still rather uncommon and difficult to confirm.

Cold-Finished Steel Bars.—Reduction of the Cleveland base price on cold-finished steel bars to 2.30c. to meet the quotation of the new producer at Buffalo was not unexpected and places the market on the same price footing at all four of the basing points. Pittsburgh mills will meet outside competition in some cases, but the new basing point at Buffalo will not affect the price for many large users. The market is quiet, but demand was maintained at a rather steady rate during September and some improvement is looked for this month. Users in this territory have generally covered their third quarter needs at 2.30c., Pittsburgh.

Coke.—The coke market is still dull and prices have not gained strength on either the furnace or foundry grade. The former is still quotable at $2.65 to $2.75, Connellsville, on spot business, while contract tonnage is not bringing much above the top of this range. Shipments of foundry coke are expected to improve this month and domestic coke will begin to move more freely with the coming of cold weather. The premium grades of foundry coke are holding at $4.85 a net ton, ovens.

Old Material.—The scrap market is still in a very unsettled condition, and, with mill purchases delayed for at least another week, the principal grades are quotable at 25c. a ton less than they were a week ago. This places No. 1 heavy melting steel at $17.50 to $18 and compressed sheets at 25c. less. Specialties are also weaker, and heavy steel axle turnings are off 50c. a ton. Short shoveling steel turnings have declined, as purchases are being made to cover a recent order at $13. Dealers' buying prices on heavy melting steel range as low as $17, although such sales usually represent distress tonnages. One large consumer in the district is reported to be considering the purchase of scrap in the near future, but other mills seem well supplied, and there are still hold-ups at a number of points. The monthly list of the Pennsylvania Railroad, which closes on Oct. 2, is expected to throw some light on the price situation, as recent quotations have been largely nominal. This list contains 55,000 tons, including 9000 tons of heavy melting steel and 11,000 tons of rails. The Baltimore & Ohio list, which closes Oct. 7, contains 23,000 tons, including 5000 tons of heavy melting.

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.50 to $18.00
No. 2 heavy melting steel	15.50 to 16.00
Scrap rails	16.50 to 17.00
Compressed sheet steel	17.25 to 17.75
Bundled sheets, sides and ends	16.00 to 16.50
Cast iron carwheels	16.00 to 16.50
Sheet bar crops, ordinary	19.00 to 19.50
Heavy breakable cast	12.00 to 12.50
No. 2 railroad wrought	17.50 to 18.00
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	20.50 to 21.00
Railr. coil and leaf springs	20.50 to 21.00
Rolled steel wheels	20.50 to 21.00
Low phos. billet and bloom ends	21.50 to 22.00
Low phos., mill plates	21.50 to 22.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	21.50 to 22.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	19.00 to 20.00

Ship Construction Loans Call for Seven Vessels

WASHINGTON, Oct. 1.—The Newport News Shipbuilding & Dry Dock Co., Newport News, Va., will build two 20-knot combination passenger and cargo turbo-electric steamers of approximately 33,000 tons displacement each for the Dollar Steamship Line, Inc., which last week was awarded loans of $5,287,500 by the board for the construction of each vessel.

The board also has approved a loan of $6,304,687 to be used by the Motor Tankship Corporation in the aid of constructing five motor tankers of approximately 13,450 deadweight tons each. The vessels are to be built by the Sun Shipbuilding & Dry Dock Co., Chester, Pa.

The eleventh annual convention of the Southern Metal Trades Association will be held at Knoxville, Tenn., on Oct. 16 and 17. W. E. Dunn, Jr., Healey Building, Atlanta, Ga., is secretary.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and under 10 in., Pittsburgh	$35.00

Upset hex. cap screws, S.A.E. thread	85
Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Outside Mills Offering Bars, Plates and Shapes at Concessions—Rail Inquiry Totals Over 500,000 Tons

CHICAGO, Oct. 1.—Sales of finished steel products, though the best in seven weeks, are still short of shipments and the indications are that further revision downward in the rate of ingot production is near at hand. Specifications are the largest in five weeks, but releases are for the most part at close range, as the future is viewed with less certainty by most consumers. Fresh inquiry is brisk, the aggregate tonnage being the largest for any week, with three exceptions, since the first of the year.

Eager desire to place tonnages as the fourth quarter opens is lacking, especially as prices show less certainty than a week ago. Local producers are asking 2.05c. a lb. for plates, shapes and bars. These products from other producing centers are being offered to a wider circle of buyers at 2c., Chicago.

The rail market continues to hold a prominent place, with inquiry well over the 500,000-ton mark.

The Santa Fe has ordered 87,200 tons, of which 74,860 tons was taken by the Colorado Fuel & Iron Co. and 6170 tons each by the Inland Steel Co. and the Illinois Steel Co. Railroad equipment orders include 2000 hopper cars by the Norfolk & Western and 500 gondola bodies by the Chicago & Eastern Illinois. An oil tanker requiring 5000 tons of steel has been ordered from a Lake Michigan shipbuilder by the Standard Oil Co.

Pig Iron.—Shipments of Northern pig iron from local furnaces in the first nine months of the year established a record. Releases remain heavy at the full rate of output of the five merchant stacks that now are in blast. Iroquois No. 5 will be lighted in a few days, and with this furnace in it will again be possible for local producers to amplify stocks. Forward buying is moving steadily and it is now disclosed that a few purchasers have placed their needs through the first quarter of next year. A melter near Chicago has taken 5000 tons of Southern iron at a price which figures between $13 and $13.50 a ton, Birmingham. Interest in low phosphorus iron is increasing as supplies of English iron brought to Lake Michigan ports early in the year near exhaustion. An order for 700 tons of 10 per cent silvery has been taken at $27 a ton, Jackson County, Ohio, furnace. Prices for this commodity show no tendency to gain strength. Occasional concessions on charcoal iron are still to be found in this market.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	19.01 to 19.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is active only in less than carload lots. For business of this character prices are holding.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Sheets.—The Chicago sheet market remains active, with output fully sustained at 90 per cent of capacity. New buying, the bulk of which is for nearby needs, is almost equal to shipments and backlogs have changed little in the week. Pressure for deliveries on the heavy gage blue annealed product is easier, and promises are now being made in six to seven weeks. Other grades range from three to four weeks, while roofing sheets are obtainable in two to three weeks. The price situation is still tangled, especially to the south of Chicago. Manufacturers of farm machinery are now entering specifications for the next three months, and, if their estimates of requirements hold true, they will take in the final quarter a larger tonnage of sheets than in the corresponding period a year ago.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Rails and Track Supplies.—The rail orders placed by the Chesapeake & Ohio, Pere Marquette and Hocking Valley totaled 79,257 tons. Of this amount, the Chesapeake & Ohio will take 53,480 tons, the Pere Marquette 20,300 tons and the Hocking Valley 5477 tons. The Chesapeake & Ohio awarded 16,273 tons to the Bethlehem Steel Corporation, 10,047 tons to the Inland Steel Co., 18,604 tons to the Illinois Steel Co. and 8556 tons to the Carnegie Steel Co. The Pere Marquette placed 7920 tons with the Illinois Steel Co., 9953 tons with Inland Steel, 1727 tons with Bethlehem and 700 tons with the Algoma Steel Corporation. The entire tonnage for the Hocking Valley went to the Illinois Steel Co. Reports elsewhere last week that the Missouri Pacific had ordered about 40,000 tons of rails were not correct. This railroad has not yet sent out an inquiry. The Pennsylvania is asking for 200,000 tons of rails and will take an option on an additional 110,000 tons. This total of 310,000 tons compares with 272,000 tons the Pennsylvania took last year. The New York Central's inquiry is for 200,000 tons and may be enlarged by 14,000 tons for new construction work. Local mills are still making deliveries against the 1929 purchase of the Illinois Central, and therefore sellers do not expect that this road will enter the market until nearly the end of the present buying movement. The Santa Fe has ordered 87,200 tons of rails, the distribution of which is given in one of the leading paragraphs of this report. The Monon has ordered 4500 tons of rails from the Illinois Steel Co. Inquiry for track supplies is impressive. The light rail market is without feature.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—Bids opened this week at Milwaukee show that 200 tons of 6-in. pipe was taken by R. D. Wood & Co. at $43.90 a ton, delivered, and 300 tons of 12-in. pipe was taken by the United States Pipe & Foundry Co. at $45.50 a ton, delivered. The freight rate from Birmingham to Milwaukee is $8.50. Sidney, Ohio, has awarded 15,000 ft. of 6 and 8-in. pipe to an unnamed bidder, and the McWane Cast Iron Pipe Co. has taken 100 tons of 2 to 6-in. for Kempton, Ill., and 200 tons of 4 to 8-in. pipe for Carmel, Ind. It is reported that the United States company is low bidder on 200 tons of pipe at Bridgman, Mich. This market remains moderately active in small tonnages, on which prices are easier,

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, $43.70 to $45.70; 4-in., $47.70 to $49.70; Class A and gas pipe, $3 extra.

Plates.—The Pacific Gas & Electric Co. has placed with the Milwaukee fabricator 348 miles of pipe, which will require about 55,000 tons of plates. The Milwaukee company has also booked a 14,000-ton order for 20-in. pipe for California. It is understood that these orders are for immediate fabrication, and local plate mill schedules are being helped out by releases of steel by this fabricator whose output was curtailed several weeks ago when a contract for line pipe was temporarily suspended. It is reported here that a 100,000-ton line pipe project is under consideration for the delivery of gas from Texas fields to the Central West. Shops which recently took car orders for the St. Paul have placed this week the needed 12,000 tons of steel. Tank steel orders total 5700 tons, and fresh inquiry is for 3000 tons. A Chicago shop will fabricate 3000 tons of plates for tanks to be erected in Texas and 1200 tons will be fabricated in Oklahoma.

Reinforcing Bars.—New inquiries before the trade indicate a more active market, but sales are sluggish notwithstanding the pressure brought to bear by the possibility of higher asking prices. In the past, like gestures by sellers have driven in numerous contracts. At present, however, buyers are handicapped in the matter of arranging loans for new construction purposes. Many plans have been

prepared by architects and in general purchases appear willing to come into the market as soon as funds are available. A small tonnage of Cook County, Ill., highway work is in early prospect. The lateness of the season may delay until spring extensive road building plans by the State.

Structural Material.—Business in prospect is enlarged this week by the announcement that the Marshall Field Estate will erect a 42-story office structure in Chicago. Preliminary estimates place the steel needed at 20,000 tons. Awards for the week, including 2300 tons for a Chicago public school building, total 4400 tons. Fresh inquiry amounts to 6300 tons, not including the Marshall Field Estate Building.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Wire Products.—Little change has occurred in this market in the last week. Forward contracting has gained some headway, but spot orders, especially from the jobbing trade, are unusually light for this time of the year. Prices continue to lean to the weak side, especially when deliveries are to the south and southeast of Chicago.

Old Material.—Consumers of heavy melting have bought a total of 20,000 tons, following fairly large purchases of a week or so ago. Brokers are busily covering recent sales. Declines in prices in recent weeks have made buyers of all grades of scrap more cautious and, as a result, open inquiry has almost wholly disappeared from the market. However, shipments of most grades continue to go forward in good volume. Scrap iron and steel coming on track is a little in excess of melters' requirements, and this fact is tending to depress prices. Dealers find the needs of gray iron foundries more spotty than in September. On the whole, there is small change in the rate of melt by foundries, though their order books are growing lighter. Agreement among dealers as to definite specifications for hydraulic bundles prepared by them is leading buyers again to consider the use of this grade. Though offers of this grade have been made, no sales are reported. Dealers are finding a free supply of heavy melting steel at $15 a gross ton, delivered. Though prices are weak, brokers do not look for a serious break. The closing of two lists, one by the Chicago & North Western and one by the Burlington, have been postponed until late this week. New lists are being offered by the Pennsylvania, New York Central, Michigan Central, Big Four and various units of General Motors Corporation.

Prices deliv'd Chicago district consumers:

	Per Gross Ton
Basic Open-Hearth Grades:	
Heavy melting steel	$14.50 to $15.00
Shoveling steel	14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails	16.25 to 16.75
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings	10.75 to 11.25
No. 1 busheling	12.75 to 13.25
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.25 to 14.75
Low phos. punchings	17.00 to 17.50
Low phos. plates, 12 in. and under	17.00 to 17.50
Blast Furnace Grades:	
Axle turnings	12.00 to 12.50
Cast iron borings	10.50 to 11.00
Short shoveling turnings	10.50 to 11.00
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.50 to 18.00
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	20.00 to 20.50
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
	Per Net Ton
Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	17.50 to 18.00
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.00 to 13.50
